THE PHILIP HAMILTON McMILLAN MEMORIAL PUBLICATION FUND

THE present volume is the tenth work published by the Yale University Press on The Philip Hamilton McMillan Memorial Publication Fund. This Foundation was established December 12, 1922, by a gift to Yale University in pursuance of a pledge announced on Alumni University Day in February, 1922, of a fund of \$100,000 bequeathed to James Thayer McMillan and Alexis Caswell Angell, as Trustees, by Mrs. Elizabeth Anderson McMillan, of Detroit, to be devoted by them to the establishment of a memorial in honor of her husband.

He was born in Detroit, Michigan, December 28, 1872, prepared for college at Phillips Academy, Andover, and was graduated from Yale in the Class of 1894. As an undergraduate he was a leader in many of the college activities of his day, and within a brief period of his graduation was called upon to assume heavy responsibilities in the management and direction of numerous business enterprises in Detroit, where he was also a Trustee of the Young Men's Christian Association and of Grace Hospital. His untimely death, from heart disease, on October 4, 1919, deprived his city of one of its leading citizens and his University of one of its most loyal sons.

COMPLETE TABLE OF CONTENTS OF VOLUMES I, II, III, AND IV

The table of contents for this volume (Volume IV) consists of the topics in the general table of contents, listed below, which are designated by asterisks. The general table is repeated here by way of furnishing a perspective of the whole treatment.

VOLUME I

Preface.

PART I

INTRODUCTORY

Chapter I. Starting-Points.

- §1. Adjustment.
- §2. The Man-Land Ratio.
- §3. "Society."
- §4. Organization.
- §5. Preponderance of the "Masses" in Society.
- §6. Association.
- §7. Drawbacks to Association.
- §8. Advantages of Association.
- §9.* Primitive Atomism.
- §10. The Evolution of Association.
- §11. The Socializing Forces.
- §12. Hunger and Sex-Love.
- §13. Impulses to Self-Gratification.
- §14. Ghost-Fear.
- §15. Elemental Needs.
- §16. Antagonistic Coöperation.
- §17. Custom.
- §18.* Folkways and Mores.
- §19. Development of the Folkways.
- §20. The Mores.
- §21. The Mores in Evolution.
- §22. Evolutionary Series.
- §23. Society and the Individual.
- §24. Land, Men, and Mores.

Chapter II. Modification of the Man-Land Ratio.

- §25. Law of Population.
- §26. Numbers and Civilization.

* An asterisk after a section-number indicates that there is in the *Case-Book* a section corresponding to that number.

- §27. Action of the Arts of Life.
- §28.* The Collection Stage.
- §29. The Hunting Stage.
- §30.* The Pastoral Stage.
- §31.* The Agricultural Stage.
- §32.* Degree of Density in Population.
- §33. Underpopulation.
- §34. Concentration.
- §35. Effect of Degrees of Density.
- §36. The Arts-Policy.
- §37.* Limitation of Numbers.
- §38. The Standard of Living.
- §39. Characteristics of the Standard.
- §40. Drawbacks of the Standard.
- §41. Predatory Standard-Seeking.
- §42. Prudential Control.
- §43. The Limitation-Policy.
- §44. Inevitability of the Law of Population.

Chapter III. Divisions of the Science of Society.

- §45. Society a Living Whole.
- §46. Institution-Building.
- §47. The Major Institutions.
- §48. Order of Treatment.

PART II

SELF-MAINTENANCE: INDUSTRIAL ORGANIZATION

Chapter IV. Industrial Organization: Factors.

- §49.* Original Destitution.
- §50. Coercion to Organization.
- §51. The Industrial Organization.
- §52. Foresight.
- §53.* Labor.
- §54. Incentives to Labor.
- §55. Capital.
- §56. The Simpler Terms of Maintenance.

Chapter V. Labor: Specialization.

- §57. Specialization by Sex.
- §58. Sex-Differences.
- §59. Sex-Mores.
- §60. Sex-Codes.
- §61. Sex-Destiny.
- §62. Woman and Marriage.
- §63. The Sexes are Complementary.
- §64. Coercion of Woman.

- §65. Man's Encroachment.
- §66. Reactions of Sex-Specialization.
- §67.* Specialization in the Food-Quest.
- §68.* Specialization in Handicrafts.
- §69. General Conclusion as to the Arts.

Chapter VI. Labor: Specialization and Coöperation.

- §70. Specialization Other than by Sex.
- §71. Coercion to Activity.
- §72.* Rudimentary Specialization.
- §73. The Organizing Function of Might.
- §74. Specialization as Adaptation.
- §75.* Conditions of Group-Specialization.
- §76.* Trade and War.
- §77.* Transitional Forms.
- §78.* Exchange in the Industrial Organization.
- §79. Exchanges in General.

Chapter VII. Capital.

- §80.* Primitive Improvidence.
- §81.* Motives to Accumulation.
- §82. Religion and Capital.
- §83. Capital and Class-Distinction.
- §84. Production-Capital.
- §85. Capital among Hunters, Herders, and Tillers.
- §86. Services of Capital.

Chapter VIII. Appropriation of Energies: Fire.

- §87. The Technique of Self-Maintenance.
- §88.* The "Taming of Fire."
- §89. Utilities of Fire.
- §90. "Keeping" Fire.
- §91. Fire and Socialization.
- §92.* Fire and Religion.
- §93. Summary.

Chapter IX. Appropriation of Energies: Animals.

- §94. Man and other Animals.
- §95. Domestication.
- §96.* Artificial Selection.
- §97. Animal Services.
- §98.* Pastoral Society.
- §99.* Animals in Religion.

Chapter X. Appropriation of Energies: Men.

- §100. Enslavement.
- §101. Slavery and Hunting.
- §102.* Slavery and Herding.
- §103. Slavery and Tillage.
- §104.* Slavery as an Adjustment.

- §105.* Slavery for Debt and Crime.
- §106. Societal Effects.
- §107. Extensions and Correlations.

Chapter XI. Property.

- §108. Root-Ideas of Property.
- §109. Appropriation makes Property.
- §110. Property a Monopoly.
- §111. Property is Societal.
- §112. Property and the Socializing Forces.
- §113.* The Rôle of Vanity and of Ghost-Fear.

Chapter XII. Forms of Property.

- §114.* Communal Property.
- §115. Land the Crucial Case.
- §116. Emplacement.
- §117.* Land as Maintenance-Area.
- §118. Property in Tillage-Land.
- §119.* Family-Holdings.
- §120.* Ownership by the Chief.
- §121.* Personal Property.
- §122.* Property in Trees.
- §123.* Personal Holdings in Land.
- §124. Private Property in Land.

Chapter XIII. Some Generalities on Property.

- §125. Variation in Property-Forms.
- §126. Fictions about Land.
- §127. Communalism.
- §128. Communalism as Insurance.
- §129. Communalism as a Maladjustment.
- §130. Schemes and Doctrines.
- §131. Property-Forms as Evolutionary Adjustments.
- §132. Property-Rights.
- §133. Property and Law.
- §134. Inheritance.
- §135. The Property-Institution.

PART III

SELF-MAINTENANCE: REGULATIVE ORGANIZATION

Chapter XIV. Antagonisms and War.

- §136. Regulation as Maintenance.
- §137.* Group-Hostility.
- §138.* Causes of War.
- §139.* Warlikeness.
- §140.* War-Usages.
- §141.* Rules of War.

- §142.* The Drift toward Peace.
- §143. The Services of War.
- §144. Militarism and Industrialism.
- §145. War as an Evolutionary Factor.

Chapter XV. Associations.

- §146. Rudimentary Groups.
- §147. Kinship and Proximity.
- §148. Composition of the Tribe.
- §149.* The Clan.
- §150.* Blood-Brotherhood.
- §151. Group-Bonds.

Chapter XVI. Government.

- §152. Regulation.
- §153.* Embryonic Government.
- §154. Tribal Government.
- §155.* The Chieftainship.
- §156.* Succession and Distinction.
- §157.* Women as Rulers.
- §158. Monarchy.
- §159.* Checks on Monarchy.
- §160. Administration.

Chapter XVII. Fraternities, and Usages at Maturity.

- §161.* Secret Societies.
- §162.* Clubs.
- §163.* Initiation.

Chapter XVIII. Classes and Rights.

- §164.* Social Distinctions.
- §165.* Caste.
- §166.* Plutocracy.
- §167. Class-Evolution.
- §168. Rights.
- §169. Rights and Might.
- §170. Rights and the Peace-Group.
- §171. "Natural" Rights.
- §172. The Right to Life.
- §173. Society's Interests and Rights.
- §174. Equality.
- §175. Liberty.

Chapter XIX. Administration of Justice.

- §176. Group-Control.
- §177.* Retaliation.
- §178.* Blood-Vengeance.
- §179. Justice.
- §180. "Natural" Law.
- §181. The Mores and Laws.

- §182.* Crime.
- §183.* Detection of Crime: The Ordeal.
- §184.* Punishments.

Chapter XX. Antecedents of the State.

- §185. Transition to the State.
- §186. Characteristics of the State.
- §187. Origin of the State.
- §188. Confederation.
- §189. Essentials in State-Formation.
- §190. Feudalism.
- §191. Aristocracy and Democracy.
- §192. Public Opinion.
- §193. The Liberation of Public Opinion.

VOLUME II

PART IV

SELF-MAINTENANCE: RELIGION

Chapter XXI. The Aleatory Element.

- §194. Chance.
- §195. What "Luck" Is.
- §196. Good and Bad Luck.
- §197. Adjustment to the Aleatory Element.
- §198. Mental Outfit.
- §199.* Primitive Accuracies and Fallacies.
- §200. Illusion.

Chapter XXII. The Spirit-Environment.

- §201. Ghost-Fear.
- §202. The Shock of Death.
- §203.* Death not Inevitable.
- §204. Inferences from Illusion.
- §205. Dreams about the Dead.
- §206. Projectivism.
- §207. The Imaginary Environment.
- §208. The Explanation of Luck.

Chapter XXIII. Animism.

- §209. Nature of the Soul.
- §210.* Animistic Beliefs.
- §211.* Transmigration and Reincarnation.
- §212.* The Name.
- §213.* Location of the Soul.
- §214. All Things Have Souls.
- §215. Inconsistencies.

Chapter XXIV. Eidolism.

- §216. Beliefs about Ghosts.
- §217.* The Ghost-Status.
- §218.* Mortuary Practices.
- §219.* Disposition of the Ghost.
- §220.* Life in the Other World.

Chapter XXV. The Ghost-Cult (negative aspects).

- §221. Forms of the Ghost-Cult.
- §222.* Avoidance.
- §223.* Precautions against Return.
- §224.* Disguise and other Forms of "Mourning."
- §225. Abstinence.
- §226.* Resistance.
- §227.* Expulsion.

Chapter XXVI. The Ghost-Cult (positive aspects).

- §228. Propitiation.
- §229.* Human Sacrifice.
- §230.* Food-Offerings.
- §231.* Sacrifice of Property.
- §232.* Treatment of the Body.
- §233.* Miscellaneous Forms of Propitiation.
- §234.* Antagonism of the Dead and the Living.

Chapter XXVII. Daimonism.

- §235. The Extension of the Ghost-Theory.
- §236. Daimonism as a World-Philosophy.
- §237. The Art of Living.
- §238. Transition to Daimonism.
- §239.* Ancestor-Worship.
- §240.* Hero-Worship.
- §241.* Types of Daimon.
- §242. The Animistic Basis.
- §243.* Fear of the Daimons.
- §244.* The Familiar Spirit.
- §245.* Deities.

Chapter XXVIII. Fetishism.

- §246. "Possession."
- §247. The Fetish.
- §248.* Types of Fetishes.
- §249.* The Exuvial Fetish.
- §250.* The House-Fetish.
- §251.* Hearth- and Altar-Fetishes.
- §252.* The "Word."
- §253.* The Image.

Chapter XXIX. Fetishism (continued) ; Totemism.

- §254.* The Extraordinary.
- §255.* The Lucky and Unlucky.
- §256.* The Animal-Fetish.
- §257.* The Man-Fetish.
- §258.* Ecstasy and Inspiration.
- §259. "The Great Man" and "The People."
- §260.* Totemism: Religious Aspects.
- §261.* Totemism: Social Aspects.

Chapter XXX. Daimonology.

- §262. Nature of Daimonology.
- §263. Daimonology and the Evolutionary Series.
- §264. Ascending Complexity.
- §265.* Avoidance: the Evil Eye.
- §266.* Disparagement; Deception.
- §267.* Anticipation and Interrogation.

Chapter XXXI. The Taboo.

- §268.* Religious Nature of the Taboo.
- §269. Societal Function.
- §270.* The Industrial Taboo.
- §271.* The Food-Taboo.
- §272.* The Property and Civic Taboos.
- §273. Miscellaneous Taboos.

Chapter XXXII. Sin, Exorcism, Coercion.

- §274.* Sin.
- §275.* Remission.
- §276.* Exorcism.
- §277.* Coercitives.

Chapter XXXIII. Propitiation.

- §278. Nature of Propitiation.
- §279.* Ritual.
- §280.* Renunciation.
- §281.* Continenence.
- §282.* Self-Discipline.
- §283. Vows.

Chapter XXXIV. Sacrifice.

- §284.* Nature of Sacrifice.
- §285.* Bargain-Sacrifice; Prayer.
- §286.* Atonement.
- §287.* Insurance and Investment.
- §288. The Burden of Sacrifice.

Chapter XXXV. Antecedents of Human Sacrifice.

- §289. The Food-Interest.
- §290.* Cannibalism.

- §291. Corporeal Cannibalism.
- §292.* Animistic Cannibalism.
- §293. Survivals and Legends.

Chapter XXXVI. Human Sacrifice.

- §294.* Nature of the Offering.
- §295.* Redemption and Covenant.
- §296.* Sacral or Sacrificial "Prostitution."
- §297.* Survivals of Human Sacrifice.
- §298.* Exuvial Sacrifice.

Chapter XXXVII. Magic.

- §299. Methods of Magic.
- §300.* Exuvial Magic.
- §301.* Other Instrumentalities.
- §302.* Imitative Magic.
- §303. Nature of Magic.
- §304. Sway of Magic.
- §305.* Applications of Magic.
- §306. Effectiveness of Magic.
- §307. Correction into Science.

Chapter XXXVIII. Shamanism.

- §308.* The Black Art.
- §309. The Shaman.
- §310.* The Fetish-Man.
- §311.* Induced Possession.
- §312.* Reputed Powers of the Shaman.

Chapter XXXIX. Functions of the Shaman.

- §313.* Shamanistic Practice.
- §314.* Rain-Making.
- §315.* Theory of Disease.
- §316.* Diagnosis and Treatment.
- §317.* Therapeutics.
- §318.* Medicines.
- §319. Science and "Superstition."
- §320.* Social Position of the Shaman.
- §321. Shamanism as a Recapitulation.

Chapter XL. Religion in General.

- §322.* Alleged Absence of Religion.
- §323. Nature of Religion.
- §324.* Conservatism of Religion.
- §325.* Religion is Evolutionary.
- §326. Religion and the Mores.
- §327. Religion and Morals.
- §328. Power of Religion.
- §329. Disservices of Religion.
- §330. The Survival-Value of Religion.

VOLUME III

PART V

SELF-PERPETUATION

Chapter XLI. What Made Marriage.

- §331. The Condition of Bi-sexuality.
- §332. Conflict of Interests.
- §333. Inconsistency in the Mores.
- §334.* The Making of Marriage.
- §335. Marriage and Maintenance.
- §336. The Subjection of Woman.
- §337. Sex-Coöperation.

Chapter XLII. The Marriage-Institution.

- §338. Scope of the Institution.
- §339. The Regulation of the Sex-Impulse.
- §340. The Function of Marriage.
- §341. Marriage and the other Institutions.
- §342.* Normality of Marriage.

Chapter XLIII. The Formative Stage.

- §343.* Rudimentary Regulation.
- §344.* License.
- §345. Monandry.
- §346.* Group-Marriage.

Chapter XLIV. Evolution by Restriction.

- §347. Action of the Taboo.
- §348.* Consanguine Marriage.
- §349.* Taboos of Narrower and Wider Scope.
- §350.* Cause of the Taboo.
- §351. In-breeding in General.

Chapter XLV. Endogamy and Exogamy.

- §352.* Divisional and Tribal Endogamy.
- §353.* Divisional and Tribal Exogamy.
- §354. Miscellaneous Restrictions.
- §355.* The Ascendancy of Exogamy.
- §356. The Expediency of Exogamy.

Chapter XLVI. Marriage-Preliminaries.

- §357. The Manner of Marriage.
- §358.* "Capture-Marriage."
- §359.* Elopement.
- §360. Exchange of Women.

Chapter XLVII. Purchase and Dowry.

- §361.* Wife-Purchase.
- §362. Transitional Forms.
- §363.* The "*Ambil-Anak*."
- §364.* Dowry.

Chapter XLVIII. Further Preliminaries to Marriage.

- §365.* Group-Consent and Test.
- §366.* Chastity.
- §367.* Courtship.
- §368.* Betrothal.

Chapter XLIX. The Wedding.

- §369.* Reason for the Ceremony.
- §370.* Nature of the Ceremony.
- §371.* Survivals and Symbols.
- §372.* Religious Aspects.
- §373.* Defensive and Propitiatory Measures.
- §374.* The Continuance of Precaution.

Chapter L. Wedlock: Status of Woman.

- §375. Matrimony.
- §376.* Sex-Rights in Marriage.
- §377. Status of Woman.
- §378. Minimal Rights.
- §379.* Liberty-Rights.
- §380.* Woman as Property.
- §381. The Marriage-Mark.
- §382.* Types of Disposition over Women.
- §383.* Infidelity.
- §384.* Other Rights and Disqualifications.

Chapter LI. Status of Woman.

- §385. The Formation of Sex-Rights.
- §386. The Maintenance-Factor in Status.
- §387. Woman and Tillage.
- §388.* The Sex-Factor in Status.
- §389.* Mistrust of Woman.
- §390. Adjustments in Woman's Status.
- §391. Summary.

Chapter LII. Dissolution of Wedlock.

- §392.* Divorce.
- §393. Divorce as an Adjustment.
- §394.* Widowhood.
- §395.* The Lot of the Widow.

Chapter LIII. Plural and Pair-Marriage.

- §396. Numerical Limitation; The Status-Wife.
- §397.* Polyandry.

- §398.* Polygyny.
- §399. Some Features of Polygyny.
- §400.* Monogyny.
- §401. Monogamy; Pair-Marriage.

Chapter LIV. Posterity.

- §402. "Population-Policy."
- §403.* Restriction of Numbers.
- §404.* Infanticide.
- §405. Causes of Infanticide.
- §406.* Sterility and Fecundity.
- §407.* Pregnancy and the Couvade.
- §408.* Child-birth.
- §409.* Solicitude for Posterity.
- §410.* Treatment of Children.

Chapter LV. Family-Organization.

- §411. The Blood-Bond.
- §412. Descent.
- §413. The Family.
- §414.* Primitive Family-Organization.
- §415.* Sex-Ascendancy.
- §416.* The Mother-Family.
- §417. Some Features of the Mother-Family.

Chapter LVI. Transition to the Patriarchate.

- §418.* Transitional Forms.
- §419.* The Father-Family.
- §420. Comparisons and Contrasts.
- §421.* The Mother-Family as an Adjustment.
- §422. Readjustments in Family-Organization

Chapter LVII. Relationships and Family-Life.

- §423.* Terms of Address.
- §424. *Significance of Nomenclature.*
- §425.* Relationship-Mores.
- §426.* Artificial Relationship.
- §427.* Family-Life.
- §428.* Treatment of the Old.

Chapter LVIII. Retrospective.

- §429. The Maintenance-Substructure.
- §430.* The Function of Idealization.
- §431. Unrealities.
- §432. Modern Pair-Marriage.
- §433. The Pair-Marriage Monopoly.

PART VI

SELF-GRATIFICATION

Chapter LIX. Pleasure.

- §434. The Element of Pleasure.
- §435. Pastime and Play.
- §436. Gaming.
- §437.* Sense-Gratification: Taste.
- §438.* Intoxicants and Narcotics.
- §439. The Strain after Luxury.
- §440. Line and Color.
- §441. Rhythm.
- §442.* Dancing and Acting.

Chapter LX. Ostentation and Prestige.

- §443. Vanity.
- §444. Fashion and Ostentation.
- §445. Alterations of the Body.
- §446.* Treatment of the Skin and Hair.
- §447.* Ornament and Clothing.
- §448.* Clothing as Adjustment.
- §449.* Prestige.
- §450. Scope of Self-Gratification.
- §451. Retrospect of Self-Gratification.

PART VII

GENERALITIES

Chapter LXI. Conditions Bearing upon the Study of Societal Evolution.

- §452. The Way of Science.
- §453. Pitfalls.
- §454. Evidence.
- §455. Quality of Evidence.
- §456. Animal Series, Category Fallacy, Symbols.
- §457. Relation with History.
- §458. Relation with Statistics.
- §459. Classification of the Social Sciences.

Chapter LXII. Conclusions and Applications.

- §460. Some Conclusions from Racial Experience.
- §461. Interferences.
- §462. Correctives to Thought.
- §463. Pure Science.
- §464. Insight.

VOLUME IV

Case-Book.

Bibliography.

Index.

PREFACE

In this *Case-Book* the student is introduced, as it were, to the workshop. The following instances have been set down with little comment, though they are arranged in a certain geographical order, as explained in the Note to the Index; and they are less closely classified than the citations in the text. Categories have been allowed to run together to a certain degree; in some cases topics have not been broken into subdivisions; in general, the evidence has been permitted to appear in a guise somewhat resembling the original accumulation. It is hoped that this relative looseness of classification will assist the student to understand the complexity and endless interrelations of the materials, in that he will be obliged to do some classifying for himself. He will readily see that the evidence for the evolution of societal institutions is never wholly consistent, and that hard and fast lines of demarkation between man-made categories do not exist. He will note variations and survivals of all sorts; especially will he encounter, here as well as in the text, numerous excerpts from contemporary journals which will exhibit the persistence of mores sometimes assumed to be extinct. In any case, he has before him an extensive and representative sample of unselected evidence, from which will appear the typically inductive character of our treatment, much as the inductive processes of modern law-teaching are revealed by the legal case-method. He is advised to make a practice of scanning the following collections, under the several topics, prior to inspection of the text and its conclusions.

There has been yet another consideration which has led to the attachment of a *Case-Book* to the body of this book. Much of the evidence employed in arriving at the conclusions in preceding volumes has been excluded from the text by necessities of exposition; many of the cases listed below, though originally in the body of the book, have been removed as constituting an excessive weight on presentation. We have been unwilling, however, simply to set them aside. They have been collected with diligence and care over a number of years, chiefly by the senior author; and among them are variants and contradictories which the reader ought to see. By

scrutiny of the bulk of the evidence he will be in a position to criticize our conclusions more intelligently and doubtless often to improve upon the interpretations adopted by us. Considerations of space have forced no little contraction of our extracts, together with the omission of numbers of them altogether; but we believe that these collections, added to the evidence presented in the text, constitute a fair and reasonably full representation of the materials used.

It is our good fortune that Professor Davie joins us in the composition of this volume.

A. G. KELLER.

THE SCIENCE OF SOCIETY

CASE BOOK

§9. Primitive Atomism.

THE account of Homer¹ concerning the Cyclopes, the representatives to him of utter savagery, is typical of atomism: "Each rules his consorts and children, and they pay no heed to one another." Says Curr² of the Australians: "Sorcery makes them fear and hate every man not of their own coterie, suspicious of every man not of their tribe; it tends to keep them in small communities, and is a great bar to social progress. . . . It is a singular fact that very few, if indeed any, of the Australian tribes celebrate any event with a feast or take a meal in common. . . . One of the leading characteristics of the Australian Black is that he entertains an intense hatred to every man and child of his own color, outside of those tribes with which he is personally acquainted, and longs to satisfy it with blood."

The Papuan of New Guinea lacks all political organization and common feeling; "everyone claims for himself unlimited freedom of action and movement, and the same purely individualistic principle finds its somewhat extended application in the family and village community."³ "To the primitive man," comments Hagen,⁴ "one's own self comes first. . . . Compassion, charity, gratitude, all are concepts unknown to him." Krieger⁵ says that the people of villages a few kilometers apart cannot understand each other's language, owing to the great number of dialects in New Guinea. They cannot form a unit larger than a village for this reason and because of mutual distrust, the latter being due in good part to fear of sorcery; the natives are suspicious, shy, cowardly, and untrustworthy. The average distance over which a language extends is from eight to ten kilometers and often each village has a separate dialect; the only means of communication over stretches is pidgin-English. Slave-raiding and head-hunting expeditions are always expected, and they do not dare cross a frontier. Seligmann⁶ corroborates these facts and says that a different language or dialect occurs every twenty or thirty miles. Neighboring tribes possessing identical physical characteristics and having many cultural features in common may yet present strange divergences. A part of the Gazelle Peninsula, though only thinly populated, is divided into twenty districts in each of which a different dialect is spoken; all of these differ so much that while two inhabitants of neighboring districts may be able to converse, those of localities a little farther removed have difficulty in understanding each other.⁷ Anxiety about imaginary ill is the prevailing tone, with distrust as an immediate consequence. The smallest islands have divisions which hold no intercourse. Difference of language is a badge of hostility. It would seem that uncivilized men tend constantly to differentiate language, which in turn keeps them uncivilized. It takes

high civilization, with communication and literature, to suppress dialects and unite masses of men. Pidgin-English in Melanesia, as in eastern Asia and western Africa, testifies to the need of overcoming the obstacle of language if the work of civilization is to go on.⁸ A similar situation existed in New Caledonia, where "the people knew of no native name embracing the entire island, but all was divided into separate districts and villages, with distinct names for each. War there was the rule, peace the exception."⁹

Among the Bushmen of South Africa, "families alone form associations in single small hordes." The only uniting force is the sentiment of sex, parenthood, or relationship. Hordes keep at a distance from one another "since the smaller the number the more easily is a supply of food procured. Even families have to break up in order to procure food."¹⁰ Nowadays the Bushmen sometimes form little villages, but only temporarily and accidentally. They have no chiefs but only the temporary leadership of some person who wins influence.¹¹ Von Schkopp¹² mentions certain Pygmy tribes in Cameroons as being timid and cautious, seldom meeting with other natives and being especially anxious to avoid encountering Europeans. The African Pygmies in general are reported as being very anti-social; they apparently have no ties of family affection, such as those of mother and son or sister and brother, and seem to be wanting in all social qualities, asking only to be let alone, to "live and let live." They preserve their freedom, of which they are intensely jealous, and hold themselves entirely aloof from other natives, among whom they neither marry nor are given in marriage.¹³ "As a result of the universal employment of fetiches in African tribes, there is no confidence between man and man. Every one is in distrust of his neighbor; every man's hand against his fellow. . . . Because of this lack of confidence, the natural affections and the duties of the dearest relations are perverted. Wives afraid of husbands, and husbands afraid of wives; children afraid of parents, and parents afraid of children; the chief of the village uncertain of his people; and the entire community that must live and eat and associate together, living and eating and associating with a constant secretly entertained suspicion of each other."¹⁴

Furness¹⁵ thinks that "possibly there is no portion of the world of an equal area where so many dialects are spoken" as in eastern Assam, some of them being totally different. The Abors of that region are said to be like tigers; two cannot dwell in one den. Their houses are scattered singly or in groups of twos and threes over an immense extent of mountainous country. If they come together, quarrels and feuds speedily disperse them.¹⁶ Among the Nagas of India united action by one village is spoken of as an impossibility; if a village decreased in numbers, the larger ones demanded annual tribute or they plundered and ruined it. "We thus see a community of some hundreds perched on a hill, and depending almost exclusively on their own resources, constantly fighting others similarly located, on all sides, yet thoroughly able to maintain themselves. Perhaps in no other part of the world can so complete a tribal isolation be seen, and subdivision carried to such an extreme."¹⁷ Of one people in Borneo it is said that they neither eat rice nor salt and "do not associate

with each other but rove about the woods like wild beasts."¹⁸ In northeast Celebes the inhabitants of the several villages are distinct tribes, each under its own chief, speaking languages unintelligible to each other, and almost always at war.¹⁹ Very averse to association are the Kubus of Sumatra; in their wild state they live in a deep forest, making temporary dwellings, if their rude shelters can be so called, where they stay for a few days at a time, gathering food. They are so timorous and shy that it is a rare circumstance for anyone to see them, and of course an extremely rare one for any white man; Forbes²⁰ thinks it doubtful if any white man has ever seen the Kubu, except as one sees the hind-quarters of a startled deer. In the Pelew Islands all show distrust and are on guard, with fixed countenances, all the time. The visitor who receives betel and food wants his host to taste of it first, to guard against being poisoned.²¹

"The most conspicuous characteristic of the Seri [American Indian] tribe as a whole is isolation. The geographic position and physical features of their habitat favor, and indeed measurably compel, isolation; their little principality is protected on one side by stormy seas and on the other by still more forbidding deserts; their home is too hard and poor to tempt conquest, and their possessions too meager to invite spoliation; hence, under customary conditions, they never see neighbors save in chance encounters on their frontier or in their own predatory forays—and in either case the encounters are commonly inimical. The natural isolation of the habitat is reflected in modes of life and habits of thought; and during the ages the physical isolation has come to be reflected in a bitter and implacable hereditary enmity toward aliens—an enmity apparently forming the strongest motive in their life and thought, and indeed grown into a persistent instinct. . . . The great fact remains that not a single mixed-blood Seri is known to exist, and that no more than two of the blood . . . now live voluntarily beyond the territorial and consanguineal confines of the tribe. . . . The Seri antipathy is at once deepened into an obsession and crystallized into a cult; the highest virtue in their calendar is the shedding of alien blood; and their normal impulse on meeting an alien is to kill unless deterred by fear, to flee if the way is clear, and to fawn treacherously for better opportunity if neither natural course lies open."²²

One of the most conspicuous traits of certain backward Alaskans is independence. "What he wants to do he will do, as a rule. He lives for the present, and gratifies the desires of the hour, no matter what it may cost him. . . . Nothing galls him like being 'bossed' or controlled. To him it is a species of slavery, and the slave is the lowest of all beings, in his estimation."²³ It is said, with reference to the disintegration of certain Amazon tribes, that "a whole race of men is wasting away before the eyes of the world, and no power of philosophy or Christianity can arrest its proudly gloomy progress towards a certain and utter destruction."²⁴ Von Martius²⁵ remarks on the curious division of the Brazilian tribes into almost innumerable groups, opposed and exclusive, "in which American mankind appears as a huge ruin." In Matto Grosso the tribes live scattered about family-wise, with pronounced jealousy of feeling toward each other. The land is overflowed for months and they have to live in

boats, which accounts somewhat for this isolation. Nevertheless these peoples show a marked intelligence. The Miranhas live in an unbroken stress of mutual hostility, practising robbery, murder, and man-hunting, and exhibiting deep savagery and cannibalism. Of the Tehuelches of Patagonia, Fitzroy²⁶ wrote: "When mutually convenient all assemble at one place but if food becomes scarce or quarrels happen each party withdraws to its own territory. At such times one party will encroach on the hunting grounds of another and a battle is the consequence." Brinton,²⁷ speaking of the isolated man who lives "alone with his wife, his children around him, his household goods and gods all within his lonely lodge," notes that "that man's monogamy, his sense of property, his feelings of duty and responsibility, of association and independence, can in no way be assimilated to those of the man who is the free product of the state, developed through countless generations of gradual culture."

§18. Folkways and Mores.

LANGUAGE well illustrates the conception of the folkways and mores; much of the following is taken from a work by one of the authors.¹ Language is one of the most original and characteristic phenomena of societal evolution; it is not possible to classify it as a science, art, invention, or fashion. It contains the ultimate germs of all these classes. It was the first of those agencies of "exchange"² which both held and universalized culture. Prior to its development and that of writing, a discovery—for instance, of the use of metals—might have been made and forgotten over and over again as the users moved from the vicinity of the deposits.³

Language is a product of the folkways which illustrates their operation in a number of most important details; it meets the need of coöperative understanding in all the work and in connection with all the interests of life. It is a societal phenomenon, being necessary in war, the chase, and industry so soon as these interests come to be pursued coöperatively. Each group developed its own language which then held that group together and sundered it from others.⁴ All are now agreed that, whatever may have been the origin of language, it owes its form and development to usage. "Men's usage makes language. . . . The maxim that 'usage is the rule of speech' is of supreme and uncontrolled validity in every part and parcel of every human tongue."⁵ "Language is only the imperfect means of men to find their bearings in the world of their memories; to make use of their memory, that is, their own experience and that of their ancestors, with all probability that this world of memory will be like the world of reality."⁶

Whitney⁷ said that language is an institution, meaning that it is in the folkways or mores. He adds: "In whatever aspect the general facts of language are viewed, they exhibit the same absence of reflection and intention. . . . No one ever set himself deliberately at work to invent or improve language,—or did so, at least, with any valuable and abiding result. The work is all ac-

complished by a continual satisfaction of the needs of the moment, by ever yielding to an impulse and grasping a possibility, which the already acquired treasure of words and forms, and the habit of their use, suggest and put within reach. . . . Every single item of alteration, of whatever kind, and of whatever degree of importance, goes back to some individual or individuals who set it in circulation, from whose example it gained a wider and wider currency, until it finally won that general assent, which is alone required in order to make anything in language proper and authoritative." The fact that Whitney's statements, if applied to any of the folkways, would serve to describe and define them, shows to what an extent language is a case of the operation by which mores are produced; they are always devices to meet a need, which are imperceptibly modified and unconsciously handed down through the generations. The ways, like the language, are incorporeal things; they are borne by everybody and nobody, and are developed by everybody and nobody. Everybody has his little peculiarities of language, his peculiarities of accent or pronunciation, and his pet words or phrases; each is suggesting all the time the use of the tricks of language which he has adopted. "Nothing less than the combined effort of a whole community, with all its classes and orders, in all its variety of characters, circumstances, and necessities, is capable of keeping in life a whole language. . . . Every vocable was to us [as children] an arbitrary and conventional sign; arbitrary, because any one of a thousand other vocables could have been just as easily learned by us and associated with the same idea; conventional, because the one we acquired had its sole ground and sanction in the consenting use of the community of which we formed a part." "We do not, as children, make our language for ourselves. We get it by tradition, all complete. We think in sentences. As our language forms sentences, that is, as our mother-tongue thinks, so we learn to think. Our brain, our entire thought-status, forms itself by the mother-tongue, and we transmit the same to our children."⁸

Nature-men have only petty coins of speech; they can express nothing great nor can they compare, analyze, and combine. They are overwhelmed by a flood of details, in which they cannot discern the ruling idea, and the material and sensual constitute their limits. If they move they have to get a new language. The American languages are a soft mass which changes easily if tribes separate, or as time goes on, or if they move their habitat. Sometimes measures are adopted in order to make the language unintelligible, as the Bushmen insert a syllable in a word to that end. "The language of nature peoples offers a faithful picture of their mental status. All is in flux. Nothing is fixed or crystallized. No fundamental thoughts, ideas, or ideals are present. There is no regularity, logic, principles, ethics, or moral character. Lack of logic in thinking, lack of purpose in willing or acting, put the mind of a nature man on a plane with that of our children. Lack of memory, anti-logic, paradox, fantasy in mental action, correspond to capriciousness, levity, irresponsibility, and the rule of emotions and passions in practical action."⁹

What we see in the cases of primitive dialects is that, if we suppose men to have joined in coöperative effort with only the sounds used by apes and monkeys, the requirement of their interests would push them on to develop languages such as we now know. The isolating, agglutinative, incorporative, and

8 Schultze, *Naturvölker*, 96.

9 Schultze, *Naturvölker*, 86, 89, 91;
Schultze, in *Am Urquell*, II, 22, 48.

inflectional languages can be put in a series according to the convenience and correctness of the logical processes which they embody and teach. The Semitic languages evidently teach a logic different from that of the Indo-European. It is a different way of thinking which is inculcated in each great family of languages. They represent stages in the evolution of thought or ways of thinking. The instance is one of those which best show us how folkways are built up and how they are pulled down. The agglutination of words and forms sometimes seems like a steady building process; again, the process will not go forward at all. "In the agglutinative languages speech is berry jam. In the inflectional languages each word is like a soldier in his place with his outfit."¹⁰ The accidental errors of pronunciation which may be due to very slight individual variations in the form of the vocal organs are cases of individual contribution to the development of language. The baby words and individual mispronunciations which are taken up by a family and its friends, but never get further, show us how dialects grow. There are changes in language which are, "in their inception, inaccuracies of speech. They attest the influence of that immense numerical majority among the speakers of English who do not take sufficient pains to speak correctly, but whose blunders become finally the norm of the language."¹¹ In analogy things which are alike are embraced in a single term; in metaphor two or more things which seem alike, but may not be so, are grouped together and are embraced in a single term. All these modes of change in language attest the work of individuals on language. Sometimes there is extension of influence to a group; again, the influence is only temporary and is rejected again; again it falls in with a drift of taste or habit, when it is taken up and colors the pronunciation or usage of the population of a great district, and becomes fixed in the language. All this is true also on the negative side, since usage of words, accent, timbre of the voice, and pronunciation expel older usages. Language therefore illustrates well all the great changes of folkways under the heads of coöperation and antagonism. There is an excellent chance to study the operation in the case of slang. A people who are prosperous and happy, optimistic and progressive, will produce much slang; it is a case of play; they amuse themselves with the language. One may think the new words and phrases vulgar and in bad taste, or senseless and ridiculous; but though he may eschew them, the masses will decide whether they shall be permanently rejected or not. The vote is informal. The most confirmed purist will by and by utter a new slang word when he needs it. One's objections are broken down; his taste is altered by what he hears. We are right in the midst of the operation of making folkways and can perceive it close at hand.

Malinowski's *Crime and Custom in Savage Society* comes to hand too late for our text to profit by it. This is regrettable—the more so in view of the esteem we accord to all the other publications of this author with which we are familiar.

The thesis of the book is, broadly, that too much attention has been given to the power of customs, taboos, and group-solidarity in general and too little to the variations about group-norms: evasions, reconciliations, atonements. The author wants to see life as it is actually lived, and he finds the outlines of all the general patterns indistinct and frayed out into threads. He is far from denying the essential control of custom; what he is protesting against is really a form

of the "category-fallacy."¹² He does not like such concepts as "group-responsibility," "group-justice," "group-property," and "communism," and protests against "the dogma of the absence of individual rights and liabilities among savages. . . . Underlying all these ideas was the assumption that in primitive societies the individual is completely dominated by the group—the horde, the clan or the tribe—that he obeys the commands of his community, its traditions, its public opinion, its decrees, with a slavish, fascinated, passive obedience. This assumption, which gives the leading tone to certain modern discussions, upon the mentality and sociality of savages, still survives . . . in most American and German works and in some English writings." In particular there has been no real study of primitive law; the assumption has been that individuals did not diverge from the paths laid down for their treading. "This lacuna in modern anthropology is due, not to any over-sight of primitive legality, but on the contrary to its over-emphasis. Paradoxical as it sounds, it is yet true that present-day anthropology neglects primitive law just because it has an exaggerated, and I will add at once, a mistaken idea of its perfection."

The contentions of the book are arrived at inductively from the author's collections assembled during his residence among the Melanesian Trobriand Islanders. The latter do not reveal any "communism" in their economic life, but "we are met by law, order, definite privileges and a well-developed system of obligations." Economic obligations exert a binding force, and there exists a real system of reciprocity, to which is attributed the dual organization. Self-interest and social ambition enforce mutual obligations. There is a legal side even to religious acts, not to mention marriage. The principle of give-and-take pervades tribal life. In short, reciprocity is the basis of social structure. Speaking of his brief classification of the rules of custom, the author continues: "Though in my survey attention has naturally been mainly focussed on the legal machinery, I was not intent on proving that all social rules are legal, but on the contrary, I wanted to show that the rules of law form but one well-defined category within the body of custom. . . . It scarcely needs to be added that 'law' and 'legal phenomena,' as we have discovered, described and defined them in a part of Melanesia, do not consist in any independent institutions. Law represents rather an aspect of their tribal life, one side of their structure, than any independent, self-contained social arrangements. Law dwells not in a special system of decrees, which foresee and define possible forms of non-fulfilment and provide appropriate barriers and remedies. Law is the specific result of the configuration of obligations, which makes it impossible for the native to shirk his responsibility without suffering for it in the future. . . . There is no doubt that custom is not based only on a universal, undifferentiated, ubiquitous force, this mental inertia, though this unquestionably exists, and adds its quota to other constraint. There must be in all societies a class of rules too practical to be backed up by religious sanctions, too burdensome to be left to mere goodwill, too personally vital to individuals to be enforced by any abstract agency. This is the domain of legal rules, and I venture to foretell that reciprocity, systematic incidence, publicity and ambition will be found to be the main factors in the binding machinery of primitive law."

It is a pity that this book must perforce be dismissed with such perfunctory attention—the recital of a few of its chapter-headings and the reproduction of several passages. Most of the author's instances are quotable. As regards the

thesis of the volume, it is probable that systematic works have been inclined to lay too little stress upon variations around types. We have stated often enough that such variations exist, and that the process of adjustment could not take place without them; that the individual is the producer of variations, and so the lead-off factor in societal evolution. But it is true, as Malinowski says, that the field-men themselves have only lately arrived at the point where they report such commonplaces. His book cannot but assist in the effort to see primitive life whole. The only possible quarrel which we could have with him is that which always impends between the field-observer and the "arm-chair systematist."

§28. The Collection Stage.

THE collection stage, as was mentioned in the text, is largely inferential. There are a few instances, however, of peoples approaching this condition and living in large part at least upon foodstuffs which they collect. The Bushmen of South Africa are a classic example of a lowly stage of development. Livingstone¹ says of them: "The Bushmen never cultivate the soil or rear any domestic animal, save wretched dogs. The chief subsistence of the Bushmen is the flesh of game, but this is eked out by what the women collect of roots and beans, and fruits of the desert." Curr² gives a description of the march of a native Australian family spreading over a front of half a mile to a mile and a half, so as to collect food. Certain peoples of the Malay States are said to have "subsisted entirely on the root of the tapioca plant, wild herbs gathered by the women, and animals trapped or killed with the aid of the blow-pipe by the men. . . . They attempted nothing in the way of agriculture, except the wild tapioca previously mentioned. Indeed, their extreme nomadic habits would hardly permit it, for . . . they changed camping ground at least three or four times in the course of a year. They had no system of chieftainship, nor did they look up to any single person as their head."³ One of the most important causes which contribute to the periodical migrations of the wild tribes of the Malay Peninsula is their great love of fruit, especially that of the durian. They spend their entire lives in the hunt for wild roots, fruit, and game.⁴ It is said of the Shoshones of the Salt Lake Desert that they were more improvident than birds and more brutal than beasts. Some tribes, it is stated, had neither arms nor utensils and but rarely ate cooked food.⁵ The Indians of the Rocky Mountains, according to Schoolcraft,⁶ planted nothing and lived only by the indigenous productions, on fish, game, and roots. They existed in small detached bodies and single families, and changed their locations so widely that they seemed to have no particular claim to any portion. Among the Firelanders, "women are sometimes sent for fuel into the forest, but not often. They pick the berries, but the men gather the fungi, for which they have to climb trees."⁷ Certain Orinoco tribes did not cultivate their lands at all. "They were always traveling from river to river collecting wild fruits; never built houses, and had no shelter from sun or rain. Indeed, it is probable that their

nomadicity saved them from extermination."⁸ Further evidence of the original condition of self-maintenance is presented in §49, on Original Destitution.

§30. The Pastoral Stage.

RATZEL¹ gives considerable attention to the pastoral economy. He cites several causes of nomadism: the pastures are not rich enough to suffice more than a short time; the rainfall makes one pasturage better at one time, another at another; quarrels over pasturage keep the weaker peoples on the move. In one case the pastures have to be deserted when they are at their best on account of the flies that injure the camels; the herds must retire to the forests. This author distinguishes three ways in which the transition from nomadism to settled life has come about: where a wandering race has been compulsorily confined within limits so narrow that roaming was out of the question, for example, in the case of the invaders of the Greek peninsula; where herds have been lost in war or by pestilence; or where the desire for comforts and luxuries has overcome the love of freedom. "Only he can fully understand the power of trade as a civilizer who has seen its operation in the steppes." Tea, opium, spirits, fine clothes, and weapons will corrupt the hardiest nomad. Trade arouses and creates wants and then meets them until the nomad sees that he cannot satisfy them any longer unless he (that is, his wife and daughters) goes to work at agriculture or industry. China has been able to accomplish little against the Mongols with the sword; even if its armies had had great success, they would not have been nearly so efficacious as the operations of trade, to reduce them to poverty and weakness and, in a measure, to diligence and active industry.

The difficulty in making the transition to settled life is well shown in the case of the Bashkirs. They used to have flocks and herds and horses, but now they have not. They draw wood from the forest, get honey, hunt with falcons, catch fish, and work in the factories and mines; they do not like agriculture. Their economic position is extremely poor; their only forms of property are shirts full of holes and bast shoes. It is possible to meet them in summer going to work shirtless, barefooted, bareheaded, with only a few rags wound round the body; in winter they put on the single over-garment. Their food is bad, especially in winter; in summer when the cattle can get grass they get on pretty well, but in winter the cattle and the people alike suffer hunger and there are days together when they get nothing to eat. Their unfortunate condition is said to be due to a transition from nomadic life. The allotments of land to them, fifteen dessiatine (40.5 acres) each, would be sufficient for a good farmer, but not for them with their mode of life; hence they have fallen into poverty and sold their land.²

All civilized people, according to Ratzel,³ have a common interest against nomadism. China and Russia in Central Asia are in fact allies encompassing the nomads from both sides. The Russians suppress the Turkish tribes and the Chinese the Mongolians. Both crowd out the nomads, the Russians more energetically, the Chinese more slowly, depriving them first of their plunder-

⁸ Roth, in BAE, XXXVIII, 214-215.

¹ *Vhde.*, III, 36, 47, 57; Lippert, *Kgchte.*, I, 478-479.

² *Russian Ethnog.* (Russ.), II, 110.

³ *Vhde.*, III, 54.

territory, then of their pastures, until they must migrate or settle. Vámbéry is quoted to the effect that the destiny of nomads is to be driven into the barrenest parts of the deserts and steppes, there to sink into misery and die out. "Civilization strengthens him who bends beneath it and weakens him who resists it. The Mongols conquered China and then were absorbed and conquered by Chinese civilization. All conquerors must assume the duties of conquest and of the height in world importance to which they have arisen." They must make permanent states and establish strong institutions fit for a great state, or fall. "The nomads conquer with a rush. Then this necessity comes upon them. If they bend to it, nomadism is sacrificed. If they resist it, they decline again." Nomadism flourished in Asia so long as Siberia was open as a retreat. Thence the nomads made their excursions, and when repelled, thither they retreated; the wild tribes there were no barrier against them. The conquest of Siberia by Russia put an end to this, and the effect for Europe was as great as the effect for Asia of the conquest of Mongolia by China. Though in north Africa and west Asia nomadism has been restrained by the Mediterranean and the states bordering on it, it has been protected by the Arabian and African deserts until now the Sudan states, built out of nomads, are setting bounds to it.⁴

There are really several kinds of nomadism: first, that of the Bushmen and Australians, wandering hunters and collectors; second, that of shepherds and herdsmen, such as the Masai and Arabs; and third, the type presented by horsemen, of which there are several varieties—the Patagonians, Abipones, Kirghis. As an example of nomadism not related to pastoral economy, may be cited the tendency of the inhabitants of nearly all the Pacific Islands to wander from place to place in their large canoes, so that at times an island would appear to be thickly peopled, and at others scarcely an individual was to be found.⁵ But the term is chiefly applied to cattle-raising, for herding and nomadism go together. The desert is preferred if it gives more room, so that in Namaqualand fruitful oases are avoided by the population.⁶ The nomadic Tungus are cattle-breeders, and change their habitat according to the season of the year. Each clan has its own region assigned to it, land over which they can wander at will and where no strangers are allowed to settle.⁷ Typical pastoral people are the Soyots, reindeer nomads of the upper Yenesei. They systematically capture wild reindeer which are tamed and crossed with the tame ones, so that the tame reindeer stand in type quite near the wild. The tame ones go out and mingle with the wild and the Soyots regard it as very favorable that the two shall cross. The wild ones when associated with men speedily become fully tame. The reindeer like salt and the Soyots put it out for them; this is one of the ways in which they are attracted to man. The tame ones that go off with the wild return after two or three weeks. They are taken by hand; no lasso is used except for horses. The Soyots regard the herds as their chief property and pay no attention to agriculture; all animals are specially marked. Meat is often eaten raw or merely warmed; raw blood is seldom drunk. The reindeer are used in riding and as beasts of burden.⁸ The Todas raise buffaloes and, like other pastoral peoples, are often on the move. "There are two chief reasons for these movements of the buffaloes, of which the

most urgent is the necessity for new grazing-places. During the dry season, lasting from December to March, the pasturage around the villages where the Todas usually live becomes very scanty, and the buffaloes are taken to places where it is more abundant. . . . The other chief reason for the migrations is that certain villages and dairies, formerly important and still sacred, are visited for ceremonial purposes, or out of respect to ancient custom."⁹

Africa shows how nomadic or semi-nomadic life hinders the growth of the arts by constant change of place and restlessness; nomadic tribes of Africa manufacture scarcely any tools but obtain them through trade.¹⁰ Before European intervention changed the conditions of life in Africa, it was the dweller in the plains and the fertile plateaux, and not, as in Europe, the dwellers in the mountains, who were the virile and fighting races. "The natural wealth of the African consists of live stock, and it is the ambition of the labourer and the peasant to buy one or two head of cattle and several wives. . . . Though as a rule the desires of the pastoral tribes are limited to the acquisition of grazing lands, and they were indifferent to territorial sovereignty, it would seem that small sections were otherwise minded. Thus in South-East Africa the cattle-owning Zulus founded in Zululand the dynasty of Tchaka, and further north the Wahima became kings of Uganda, Unyoro, and Ankole. In the west the Fulani pastorals in like manner became the dominant race. The Masai and the Somalis, on the other hand, though they held undisputed sway over the greater part of East Africa, founded no dynasties. But though in these instances the pastorals created the governing caste over the settled agriculturists, the bulk of the tribe remained as semi-nomad pastorals, completely out of touch with their aristocratic kinsmen, socially less advanced than the settled and urban population, but maintaining by rigorous ordeals and tests a high standard of personal courage and endurance."¹¹

The warlike and predatory element is generally characteristic of nomadic life; nomads often rob and destroy and hinder orderly growth. "When the horses come in strong from the pasture and the second shearing of the sheep is over the nomad calls to mind whatever raids for booty or revenge he has postponed. His staff turns easily into a weapon. Avenger, hero, and robber are the three steps through which the young men go. The two motives are the desire for the wealth reported to be accumulated in more civilized regions and the love of adventure and romance."¹² Lippert¹³ calls this the Beduin mode of existence, the term signifying a desert or steppe people with horses or camels and some cattle, who live not so much by peaceful grazing as by fighting and plundering. Nomadic peoples are usually warlike.

The Hottentots are a herding people or at least in the transitional stage between hunting and herding. A kraal in Namaqualand sometimes has a hundred huts made of mats upon a framework of branches, with as many as ten or twelve persons in a hut. The cattle form one big herd in which, however, each one owns his share; the kraal is set in a ring, and the cattle are herded at night inside the ring, each pair having the hind legs tied together.¹⁴ The Akamba have no legend as to the origin of cattle and other domesticated animals, but say that there was a time when the tribe possessed no cattle but only hunted game. They do not brand the cattle except those sent away to pay for a wife

or those surrendered as blood-money for a death.¹⁵ Among the Wahima and Masai, a few herdsmen suffice to keep together herds of several hundred; "one or two Wahima, whistling through their teeth in a very peculiar way, place themselves at the head of a herd which follows them like dogs, even though long stretches are to be covered at a trot or the way is over difficult hilly ground and through water."¹⁶ Herding is not practised much between the Congo and the Niger, perhaps on account of the *tsetse-fly*.¹⁷ Diseases which affect cattle are often a source of difficulty; "thirteen years ago [1879] the cattle plague, which devastated so much of East Central Africa, swept through Ankole and carried off three-fourths of the cattle. The Bahima, who then depended almost exclusively on their cattle for food, perished from starvation in great numbers, and the following year still more of them died from a visitation of smallpox, which proved very fatal to them in their weakened condition. Lieutenant Mundy states that from the information given to him by intelligent Bahima, he believes the Hima population and their stock of cattle at the present day to be not more than a third of what they were fourteen years ago."¹⁸

On account of the passion of the Upper Nile negroes for cattle, the slave-dealers, in order to offer them their heart's desire, robbed others of their stock. The destruction of the herds is used as a political means of subjugation.¹⁹ Seligmann²⁰ gives a vivid picture of pastoral life in the Sudan. "In Northern Kordofan the life of the nomad Arabs, though pastoral like that of the Beja of the Red Sea Province, differs from the latter on account of the severity of the dry season and the organized effort that is required to meet it. The movements of families are no casual wanderings, nor are independent groups of tents to be found scattered over the country, but all movements take place *en masse*. Nothing is left to chance, no 'here to-day and gone to-morrow,' no tents shifted silently in the night as is so often supposed. The whole life of the tribe is regulated by the supply of grass and water for men and cattle, and it is only during the short wet season that there is a complete freedom of movement within the tribal boundaries. . . . At the close of the wet season the Sheykh of each section sends out scouts to find out where there is most water. There are certain known *fula*, slight depressions with a clayey bottom, in which the water lies for some time, though in none of these . . . does the water last throughout the dry season, and in most of the sandy wadies the surface water disappears as soon as the rains are over. Great care must be exercised in choosing the summer quarters, so that there may be reasonable hope of sufficient water for the dry season. . . . In the middle of January, cows and goats were being watered every third day, sheep every fifth, horses every day, and camels, kept for convenience near the *feriq*, only drank once in ten days." At the end of the season the camp is shifted, each *da'n* keeping together. "A *da'n* consists of a man and wife or wives, children, and retainers, including all slaves and freed men under his protection. The cattle are driven in front, then follow the camels bearing the women, each of whom, if her husband is rich enough, reclines in her *utfu*. . . . The baggage camels plod along, while the men mounted on their trotting camels superintend the caravan. . . . The march is usually continued

for about ten hours without a break, but with heavily laden camels the pace is slow. This mode of travel continues until the winter quarters are reached."

Before the arrival of Europeans in America there were no pastoral peoples. Following the introduction of the horse a few peoples in the southern pampas developed in the direction of nomadism.²¹ To-day, owing largely to the encouragement given by the United States Indian Service, a considerable number of American Indians are cattle-raisers.²² The ancient Egyptians succeeded in taming some kinds of cattle without having passed through any real stage of nomadism.²³ "The chief pursuit of the Israelites was breeding, especially of goats, sheep and cattle. With them property and cattle meant the same thing. The life of the shepherd and the yield of the herd were extolled in innumerable phrases, the love and faith of Jehovah being likened to the care of the shepherd."²⁴ There were two seasons among the Aryan herders: one, when the cattle could live out of doors, and another when they must be penned.²⁵ Common to all inhabitants of Germany, said Strabo,²⁶ "is their readiness to migrate—a consequence of agriculture in the proper sense—and their custom, instead of laying in stores of provisions, of living in huts and providing only for the needs of the day. They derive most of their food from their cattle like the Nomads; and imitating them they load their goods and furniture on wagons, and move with their cattle wherever they like."

We cannot infer from the use now made of an animal that it was first domesticated with that utility in view. The horse and camel, thinks Ratzel,²⁷ were originally domesticated for milk and only later became beasts of burden. The element of comradeship, not only with respect to dogs but other animals as well, must also be included. There can be no sentiment about agriculture as there is in Africa about cattle, which are for the negro the "basis of life, fountain of joy, measure of property, means of winning all other desirable things, above all women and finally even money;" for him the cattle may come to be even a brake on progress, for he will not give them up to advance in civilization. Naturally, people can be reduced to utter misery through having their cattle stolen; the Nubians ruined the Dinka in this way, and the Basuto were also overthrown by the same expedient. Cattle also excite cupidity and occasion war; how they affect the whole life of the tribe will be shown in §98.

Cattle are more valuable to the negroes of East Africa as beasts of burden than for milk or meat. Here is found the custom of bleeding the cattle at intervals and drinking the blood; from a strong ox the negroes will take about a liter of blood, repeating the operation in a month. They drink it raw or mixed with milk.²⁸ The Bageshu are very fond of bleeding the bulls and cooking the blood, which is considered a great delicacy. "The mode of drawing the blood is to tie a cord tightly round the animal's neck until the artery swells out, and shoot an arrow, which has a guard on it to prevent it from going in too deeply, into the artery. They draw off two or three pints of blood which they boil and make into a pudding. The animal soon recovers from its loss and is apparently none the worse for it."²⁹ The milch-cow of south-east Africa is said to give milk only as long as the calf needs it and to permit herself to be

milked only when the calf is standing near by.³⁰ The tribes of British Central Africa use milk but little, and eat the flesh only when an animal dies.³¹ With the Bahima milk is the chief diet. "When milk is plentiful they drink it warm from the cow early in the morning, and what is over they drink at noon. They never allow the milk to stand after noon or to go sour; what they cannot drink they give to their servants. When cattle are few and milk is scarce, the men drink the morning milk, and the women the evening. . . . vegetables are, however, tabu to both men and women under ordinary circumstances; the person who eats vegetables ought not to drink milk."³² Milk must never be boiled for food; they believe it causes the cows to fall ill and die. The herding tribes amongst the negroes generally despise other food than milk, fat, and meat, and everything concerned with milk and milking is sacred. They scarcely ever take milk when sweet. The receptacles are never washed nor is the milk ever allowed to touch metal for fear of harming the cow.³³

§31. The Agricultural Stage.

ALTHOUGH agriculture leads to a settled life, primitive peoples who cultivate the soil are sometimes not highly sedentary. As compared with hunters and cattle-raisers, they show a much greater attachment to one locality, but in comparison with more civilized conditions there is still considerable wandering. This is largely because of the nature of primitive agriculture and the warlike conditions of the times. Thucydides¹ says that "the country which is now called Hellas was not regularly settled in ancient times; the people were migratory, and readily left their homes whenever they were overpowered by numbers. There was no commerce, and they could not safely hold intercourse with one another either by land or sea. The several tribes cultivated their own soil just enough to obtain a maintenance from it, but they had no accumulations of wealth, and did not plant the ground with trees; for, being without walls, they were never sure that an invader might not come and despoil them."

Among primitive peoples today conditions exist similar to those described by Thucydides. Certain clans of Manipur "fell a piece of jungle and, when sufficiently dry, burn it and then dibble in the seed, and seldom cultivate the same piece of land for more than two years in succession. They therefore need much room, and the desire for new land, coupled with the fear of stronger clans, has led to the whole race adopting a more or less vagabond mode of life, which has been made fatally easy by the wide-spread growth of the bamboo, which makes house building, of a certain kind, very simple."² Similar conditions of agriculture exist in Ceylon. "The Culture-Veddah is distinguished from the Nature-Veddah through the cultivation of grain alongside of hunting, the gathering of honey and the digging of yams. When he moves into his summer quarters he fells a suitable piece of forest and burns it down in the intervals between hunting. When the rains come he builds a dry hut on the open place and sows seeds on the charred areas; he then leaves his family there with a stock of provisions and makes for several days toward the high grounds for the purpose of stag-hunting, during which time he lives in caves. When the

weather clears and the grain ripens, he returns and proceeds to gather the harvest. Small presents are given to other less provident companions who during his absence have presented small pieces of meat and the like to his family. After the harvest, and now in the dry season, the family goes to a district where lizards are to be found. The Culture-Veddah makes his hut tighter than the Nature-Veddah and does not, like the latter, take his family with him to the high grounds; however, he has not yet learned how to make his clearance of land into a field or garden, or his six-months' hut into a permanent home."³

The negroes are said by Ratzel⁴ to be the best tillers of all nature-people. He also says that although they are good agriculturists and have copious resources, they are almost nomadic and change the site of their villages from generation to generation. Many of them plant hedges round their fields, loosening the ground with a wooden hoe, since superstition prevents some from using iron tools. The plow is as yet almost unknown to negroes. They have great difficulty in storing food from one year to another: in the region of the tropical rains and the white ants the granaries consist in huts or other arrangement raised on posts, while the Bechuanas use vessels of pottery, located in the open field.⁵ Johnston⁶ has emphasized the improvident nature of negro agriculture: "It is this wasteful habit of the African," he says, "whose only idea of manuring the soil is, when he first clears it, to cut down and burn to ashes all the brushwood and trees, afterwards digging the ashes into the soil—which has done so much to turn Africa from a land of forest into one of prairie, steppe, and even desert. As a Negro tribe flourishes and increases in numbers, so it gradually destroys all the forests in its country by extending its clearings for agricultural purposes and abandoning each plantation as the soil becomes exhausted after the first few crops." Weeks⁷ describes a similar situation in the Upper Congo district: "Large farms were made around the towns. The men did the clearing of the bush, felling the trees, and cutting down the undergrowth: the women worked with them, heaping up the grass and brushwood ready for burning, and helping generally. As a rule, the women did the hoeing, planting and weeding, but the men did not so despise this work as never to do it. . . . Their mode of hoeing never allowed them to go deeper than 4 or 5 inches into the ground, consequently a farm was played out after three or four seasons, and then it was allowed to lie fallow, another piece was cleared and hoed."

Some of the American Indians were agriculturists, especially those in the east and south, who combined tillage with fishing and hunting and resided for the greater part of the year in villages.⁸ Their agricultural development was checked by the lack of domesticated animals; when the American aborigines first saw oxen plowing they pitied them and blamed the Spaniards for laziness in putting work on animals.⁹ Agriculture led the Shingu tribes of Brazil to a sedentary life. Though these tribes had been reduced to a partially settled existence by fishing, still the fish were plentiful only at particular seasons when the river was full; and so they remained more or less nomadic until the women had learned to plant, make pottery, and prepare meal.¹⁰ Hunting and fishing

and seeking fruits in the woods are, next to war, the chief occupations of the men among the Guaycurus of Brazil, while the business of the women is to prepare the flour from the roots of the mandioca plants and the manufacture of cotton stuffs and pottery.¹¹ Neither bananas nor mandioca are cultivated by the Botocudo, for, with an eye to the produce of the chase, he moves out of the district before those plants have time to ripen; maize, beans, and pumpkins, which promise a yield within a few months, are cultivated by the women. Even the maturity of the maize is often not waited for, but the half-ripe kernels are roasted in the fire. The women gather edible roots, palm-cabbage, the different fruits of the forest, and honey.¹² In Paraguay, each horde has a definite place near a stream which never dries up, whither they always return, and where they cultivate a little maize, mandioca and a kind of pumpkin; otherwise they live by hunting and fishing.¹³

The history of the development of agriculture among the Araucanians is instructive. "Up to the present time the Araucano only takes to agriculture in a desultory fashion, and to provide the mere necessities of life. Their methods are of the most primitive. Probably the principal reason why the barbarian tribes take to agricultural life with such distaste is the difficulty of inadequate implements, and the consequent amount of labour entailed by such work, especially before the introduction of domestic animals. The Araucano, for instance, could see no use in working hard to obtain what the earth gave spontaneously; and as a consequence, so long as his liberty to roam at will was uncurtailed, he showed himself refractory to such a mode of life."¹⁴ There have been two foreign invasions which have left their indelible mark on the development of the Araucanians: the first by the Incas and the second by the Spaniards, both of which afford striking illustration of the influence of war as a factor in societal evolution. "The former first brought the Araucano into touch with civilisation. From this epoch date his knowledge of domestic animals, of the elements of agriculture, and of such arts as weaving and metal working. This period also sees him first begin to adopt a more sedentary life, constructing rude huts instead of the usual *toldo* or skin tent. As Humboldt has so justly remarked, 'the most difficult and the most important event in the history of human society is perhaps the change from a nomadic to an agricultural life.' This change among the Araucanos was not brought about by any compulsory conditions, but seems to have been adopted gradually by the race on seeing the advantages accruing from the new mode of life, and at first only in a very desultory way. The Spanish conquest brought with it knowledge of new cereals and plants, other domestic animals, a fuller use of metals, and a considerable change in the tribal government, owing to the necessity of continued union to repel the invader. . . . The Incas introduced the llama and vicuña into the country, and from that time weaving became a recognised art among the northern tribes, although farther south the possession of a few of these animals was considered as a sign of considerable wealth. But the wearing of woollen clothing did not become generalized till the introduction of sheep during the Spanish occupation."¹⁵

This section may be concluded with a few examples of the attitude with which agriculture is regarded, especially by pastoral nomads. The agricultural class

among the Huns, we are told, was despised by its fellows, and the term "wheat-eater" expressed the contempt or envy of the carnivorous Highlander. Certain tribes of western Asia have no cattle or sheep, "those animals being looked down upon as the peculiar property of tribes who have forgotten their independence and degraded themselves by the cultivation of the soil." The Kirghiz too look down with contempt on those engaged in agriculture.¹⁶ The Mongols more than almost any other race despise agriculture; therefore, though they occupied the plain, they did not cultivate it.¹⁷ The negroes of the Gold Coast regard agriculture as slavish, though this may be a notion imported from America. These sentiments reflect the antagonism of herders and tillers; especially in Africa are the former a scourge to the latter.¹⁸ In this country the tillers and the herders have fought with each other in the legislatures of many of our States; at different periods of time the rights of these two parties have been construed very differently.

§32. Degrees of Density in Population.

It seems to be impossible to reach a conclusion as to the density of the native Australian population; one explorer made an estimate which would give 70 square miles per soul, a large part of the territory being inaccessible to them so that they were confined to the rivers. Smyth,¹ making corrections, reached the conclusion that "each aboriginal" had 28 square miles. The estimated population of Gippsland would give ten and one-third square miles per soul.¹ In the Alice Springs district of Australia there were, in 1899, forty souls on one hundred square miles—and this is probably a case of overpopulation.² Brown³ states that "prior to 1820 the Narrinyeri probably numbered about 3000 to 4000 with a density of 1 to 1-3 to the square mile; that they certainly could not have numbered less than 1800, and that it is very improbable that they were more than 6000. Comparing these figures with what we know of other parts of Australia, it appears that this district must have been one of the most densely populated of the whole continent." The average number of persons in the horde is given by the same author as being about sixty; it can hardly have been over 100 or less than 25. "Taking Taplin's figure of 800 fighting men on the south side of the lakes, and taking it that there were 40 clans or hordes all told, we have an average of 20 fighting men to the clan." Dornan⁴ says of the Tati Bushmen: "I have seldom seen more than four families, numbering twenty-two individuals together, and this was a camp at permanent water."

The population on the whole east coast of Greenland, in 1884, reached 548 souls.⁵ Among the Eskimo south of Hudson Strait the individual requires 120 square miles.⁶ The Smith Sound tribe consists of slightly over 35 families—about 200 men, women, and children—who wander along six hundred or more miles of coastline. "They usually travel in groups of three or four families. Greater concentration of numbers would be dangerous on account of the scar-

city of food." Jefferson⁷ estimated the Virginia Indian population as about one to the square mile, and census-figures cited by Peschel, as of 1825, report the ratio among hunting-tribes as one to one and three-quarters square miles—the same figures being given for certain Papuans of New Guinea.⁸ Schoolcraft⁹ states that "from some data that have been employed it is doubtful whether an area of less than 50,000 acres, left in the forest state, is more than sufficient to sustain by the chase a single hunter." In another place he says that a family of five Indians needs 40,000 acres and, as predatory nomadic bands, 50 square miles to the family. These estimates, though they are no more than that, lend some concreteness to the statements about population-conditions among hunters.

Stanley saw the densely populated banks of the Congo River in Africa and estimated the population at some 40 millions; further exploration brought the estimates down to 20 or 30 millions; then, in 1911, the Belgian census reported eight and one-half millions, though some of the decrease may have been due to the harsh treatment of the natives.¹⁰ Nogueira¹¹ estimated the population of Portuguese West Africa (1880) as about two and a half per square mile; of Portuguese East Africa as three-eighths of one per square mile. An unusual condition exists in the Shilluk territory, which lies upon the White Nile and has an extent of 2000 square miles; when its population is compared with that of the populous districts of Europe, we are justified in reckoning from 600 to 625 a square mile. In 1871 the Egyptian government took a census of this territory, the result of which would indicate such a density. "No known part of Africa, scarcely even the narrow valley of the Nile in Egypt, has a density of population so great; but a similar condition of circumstances, so favorable to the support of a teeming population, is perhaps without a parallel in the world. Everything which contributes to the exuberance of life here finds a concentrated field—agriculture, pasturage, fishing, and the chase. Agriculture is rendered easy by the natural fertility of the soil, by the recurrence of the rainy seasons, by irrigation effected by the rising of the river, assisted by numerous canals, and by an atmosphere ordinarily so overclouded as to moderate the radiance of the sun, and to retain throughout the year perpetual moisture. There is plenty of fishing. Across the river there is a free and open chase over wildernesses which would advantageously be built upon, but for the hostility of the neighboring Dinka."¹² By way of sharp contrast, seventy miles away from the Shilluk territory is the land of the Bongo, where there are not over 12 to the square mile.¹³

Ratzel¹⁴ has a very significant table of the density of population of various groups as related to the type of self-maintenance:

Inhabitants per (English) Square Mile

Hunting and fishing tribes in the outermost regions of the inhabited world (Eskimo)	0.005-0.015
Hunting tribes of the steppe regions (Bushmen, Patagonians, Australians)	0.005-0.025

Hunting-tribes with some agriculture, or deriving support from tillers (Indians, Dyak, Papuans, poorer Negro tribes, Batwa)	0.5-2
Fisher-tribes on coasts and rivers (Northwest Americans, inhabitants of small Polynesian islands)	up to 5
Nomadic herdsmen	2-5
Tillers, with the beginnings of crafts and trade (inner Africa, Malay Archipelago)	5-15
Nomads with agriculture (Kordofan, Sennaar)	10-15
Mohammedan countries in western Asia and the Sudan	10-25
Fisher-tribes practising agriculture (Pacific islands)	up to 25
New countries with European agriculture, or climatically disadvantaged European countries	25
Purely agricultural regions of central Europe	100
Purely agricultural regions of southern Europe	200
Regions of commingled agriculture and manufacture	250-300
Purely agricultural regions of India	over 500
Regions of European large-scale manufacture	over 750

§37. Limitation of Numbers.

IN South Australia, no mother will bring up more than two children. They would interfere with her duty to her husband in the matter of providing food.¹ The West Australians ate every tenth child born as "necessary to keep the tribe from increasing beyond the carrying capacity of the territory"²—a motive original, probably, in the recounter's mind. There is a legend that the first settlers of an African oasis ordered that there should never be more than eighty adult males; if there were one old man, one woman, and one child for each of the eighty, the population would be 320, which is a third of the density of other Libyan oases.³ In Madagascar, "the superstition of the people, causing them to put their children to death if born on certain unlucky days, was a means of keeping down the population in all parts of the island, and still causes the destruction of a fourth of all the children new-born in some of the tribes."⁴ In Bengal, "nothing can be more curious than the results of a low assessment, whether fixed forever or not. In one large district, at least, where a low assessment was secured for thirty years, the result has been, not that a wealthy class has arisen, but that simply all restraint has vanished, and the poor population has multiplied to such an extent that the wealth accumulated is not more able to support the increased mass of people than the former resources were to feed the then existing numbers."⁵ "Though the Dyaks marry young, they do not have large families. It is not often that one meets a family of over three or four children, and I have only known of one case where a woman had seven children. The conditions are favourable, one would think, to a rapid increase of population. They have plenty of good plain food, and the climate is healthy. There are none of the principal checks to population mentioned by Malthus among savage nations—starvation, disease, war, infanticide, or immorality. What, then, is the cause of the small number of

⁵ Baden-Powell, *Brit. Ind.*, I, 346, note.

births? Climate and race may have something to do with it, but I think the main cause of it is the infertility of the women. This is no doubt brought about by the hard work they do, and the heavy loads they often carry. A Dyak woman sometimes spends the whole day in the field, and carries home at night a heavy load, often walking for several miles over hilly paths. In addition to this, she has to pound the rice, a work which strains every muscle of the body. I have often been told by Dyak women that the hardest work they have to do is this rice-pounding. This kind of hard labour begins at an early age, and never ceases until the woman is too old or too weak to work."⁶ A number of cases occur, in tribes which seem to be in decline, where the doctrine prevailed that the old men should have the young wives and the young men the older.⁷ For other instances see Ch. LIV of the text.

§49. Original Destitution.

THAT people living in a state of nature do not enjoy ease and plenty is amply illustrated, especially in the case of those tribes which inhabit the more inhospitable districts. The problem of water-supply is a difficult one in the peninsula of Carpentaria, Australia, and forces the natives to be ever on the move. "In dry times the rock-holes and most of the springs become dry, and the natives are compelled to keep in the vicinity of the rivers and watercourses; but as soon as the rain comes in sufficient quantities to replenish the rock-holes and revive the springs, the people make an exodus into the back country and remain there as long as the water lasts, because that is the only time they can pursue the game and obtain other foods in those parts of their hunting grounds. They proceed first to where the water is known to disappear most rapidly; then they go to those places in rotation where it remains longer, and in this way utilize their water supply to the greatest advantage."¹ Bassett-Smith² says that the aborigines of northwest Australia, having no means of shelter, at night would light a number of small fires and crouch, six or seven of both sexes, around the fire, together with absolutely naked children. In the wet season they put up a few branches for protection. This section is four hundred feet above sea-level and suffers from intense heat; it is possible to work only early and late in the day. The wind is scorching, the glare is blinding; only the hardiest can live there. The natives are hard pressed for food; the writer once saw a boy creep into a water-hole, swim across under water, and stealthily get among the reeds on the other side, where he seized a sleeping duck. He carried it about for a short time hugging it, and then, plucking it alive, he put it in the ashes to cook. A man finding a bandicoot's hole, thrust in his arm and pulled the animal out, singed it in the fire, bit open the abdomen, removed the entrails, and thrust it in the ashes again for a short time. He then ate it, tail first. The writer had a fish which he was anxious to keep in perfect condition, but the native spied it and seized it with his teeth just behind the head, dividing the backbone, which is the usual way in that section of killing a big fish. The natives of Australia are generally described as omnivorous; "there is nothing in the nature of food, or of substances which can by any possibility contribute

to the maintenance of life, that they will not eat."³ The southeast Australians eat great quantities of roasted moths. These, which are thickly congregated in the crevices of the rocks, are stifled with smouldering brush; then, being roasted on the hot ashes, they are shrivelled to about the size of a grain of wheat.⁴ It is necessary for a tribe in Victoria to move very frequently from place to place, always keeping within the boundaries of the country which it calls its own—"now to the spot where eels can be taken in the creeks; often to the feeding-grounds of the kangaroo; sometimes to the thicker forests to get wood suitable for making weapons; to the seacoast continually for fish of various kinds; and at the right season, to the lands where are found the native bread, the yam, and the acacia gum. Constantly under the pressure of want, and yet, by travelling, easily able to supply their wants, their lives lack neither excitement nor pleasure." In a wild state, a black did little more than attend to the wants of his stomach. There is a small plant on the root of which the children chiefly subsist. "As soon almost as they can walk, a little wooden shovel is put into their hands, and they learn thus early to pick about the ground for these roots and a few others, or dig out the larvae of the ant-hills . . . the work necessary to obtain a mouthful even of such indifferent food being thus really more than would be sufficient for the cultivation of the earth according to the more provident arrangements of civilized men."⁵

The Bushmen are a very primitive race which has been subject for centuries to a bad environment. Fritsch⁶ thinks them normal and undeveloped. They never cultivate the soil nor rear any domestic animals save wretched dogs. "Their chief subsistence is the flesh of game, but that is eked out by what women collect of roots and beans and fruits of the desert."⁷ Fritsch⁸ describes the Bakalahari as equally miserable or worse, for while he thinks the Bushmen are undeveloped and not degraded, he asserts that the Bakalahari are a heterogeneous collection of vagabonds and outcasts of the neighboring tribes. Büttner⁹ describes the Bergdamara as a race of slaves and vagabonds who support existence on anything which seems possibly edible.

In the Sahara and the Sudan, when camels and goats cease to give milk and the seed of grass is used up, there ensues a long despairing period of need, when the natives live on dum-palm fruit not fit for human food; even the Teda say that it is not possible to support life for more than a short time on that alone.¹⁰ A Tuareg, on being asked how his people got a living, replied: "When the female camel has her young and can give no milk we go to Ghat and there we eat dates, *ghusup*, and bread, if we can get it. When the camel once more gives milk we come back, drink the milk and lie around on the side of the road."¹¹ Junker¹² says of the natives on one branch of the Nile that even though their wants are very slight, they are very poor and experience a severe struggle for existence. He found no evidence whatsoever of conditions of equality and abundance which the utopians have pictured as the state of nature peoples. The only purpose in life of the natives in south-west Africa, writes Büttner,¹³ is to fill their bellies with something that looks edible; they eat

gum arabic, the pounded roots of trees, steal grass seed from ants, and regard a swarm of locusts as a blessing. "No race in central South Africa understands better than the Barwa and the Masarwa how to secure water in the driest places, how to catch the scent of wild animals, and how to approach stealthily and outwit them. Because they have been harshly treated by the Bechuanas, they are very distrustful, even toward the whites. . . . I might say that among the south African races they are what the carrion-vulture is among birds and the jackal among mammals."¹⁴

The Yakuts, who live in a difficult environment, experience a severe struggle for life; by far the greater number, says Sieroshevski,¹⁵ live at the limit of existence. So cold is the climate that in winter no ax can cut wood, which freezes as hard as stone. From a more southern habitat, where they lived on horses for all purposes, the Yakuts moved northward; then, cattle superseded the horses and hay became a great consideration because of the cold climate and the need of housing the animals in the winter. Hay is now the central factor of their existence. In the southern regions they also raise a little grain. They are in a transition from being a nomadic horse-using people through cattle-herding to agriculture; the horse is passing; cattle, though requiring hay for the winter, are becoming the mainstay; while grain-tillage is just beginning. Some subsistence is obtained through fishing which, however, operates to the disadvantage of the people, for fishing and cattle-breeding are antagonistic modes of livelihood; when they have good fishing, they pursue it and let the grass grow old and dry before they cut it. Coöperation is not in their mores; when it was proposed to them, they said: "For that people must be angels"; "People differ in industry and honesty"; "We quarrel over the division of gains at cards; we should tear each other in pieces if we tried to share hay, milk, butter and wages." The best Yakut mower with two female rakers can get in, according to the season, from twenty to thirty tons of hay, which will carry twelve or fifteen head of cattle through the winter. This is the limit; with less power, labor must be hired, hay bought, or the cattle partly starved. Even in good years part of the Yakuts suffer hunger. The commonest industrial group consists of four persons: two grown laborers, one youthful person, and one boy or old man, such a group being held by them to need ten head of cattle for its support. Above that number is ease; below it, poverty. They are well off with ten, when there is good fishing or hunting; but where no incidental support exists, as in the north with its longer winter and poorer meadows, fifteen or twenty are needed. In the south where tillage is available and there are subsidiary winter-occupations, six head of cattle, or one and one-half per soul, suffice to maintain the group, though on the verge of distress and privation. The variation is from six to twenty head per group, or from 120 to 400 rubles (about \$90-\$300) in capital. Any loss reduces such a household to misery; any luck raises it to ease. The great mass are at the limit, one and one-half head per soul being the limit of life-support. Sieroshevski knew of but one Yakut who had 500 head of cattle; a few have 100 or 200. In one district of three hundred households, 23 have no cattle, 55 have less than one per soul, 27 have one, 72 have one and one-half, then the numbers taper off, one with twelve and one-fifth and one with thirty-two and one-half per soul. Increase of wealth in cattle is limited by lack of wage-laborers and by communal owner-

¹⁴ Holub, *S.-Afr.*, I. 434-435.

¹⁵ *Yakuts* (Russ.), 273 ff., 415, 418, 423 ff.

⁴³¹; Sieroshevski-Sumner, in *JAI*, XXXI, 79-80.

ship of land. A family of three, four, or five workers and three head of cattle per soul can get along without hired laborers. After describing the budget of families on the limit of subsistence, the writer says that if they plant grain and it prospers, they win comfort, but that half are not up to that level and live in constant distress. Their dependence on luck is tragic; if prices rise a little or if one is overreached by a neighbor or gets cheated in weight by the merchant, or loses calves, these are heavy blows to the barely balanced budget. To escape ruin, they sell their products, which are in good demand, and go hungry. Salt, vodka, tobacco, and sugar go first; then grain and tea give way to substitutes, and clothes become rags. The people cannot work for hunger, the cattle grow lean and give less milk, and the family falls into a vicious circle from which only a stroke of luck can free them. Two-thirds of the Yakut families are in debt, half of them only to a slight extent, from one ruble to five per head of cattle, which they pay in due time, the rest hopelessly, so that all their industry goes to pay interest.

On account of the severe struggle for existence among the Yakuts, their numbers are kept down, especially through a high infant mortality. According to their own assertions, the fecundity of their women is, on the average, ten children for one husband; sometimes they bear twenty or even more. The author quoted knew of one case of twenty-two births, another of twenty, and another of nineteen. In most cases the number varies between five and ten. But with this high birth-rate goes the high rate of infant mortality. The author gives a case of a woman married at twenty, who lived with her husband thirty years, bearing him nine children, of whom seven died in childhood, one was born dead, and only one grew up. Another woman had nine children, all of whom died; another eight and lost them all. In other cases two were brought up out of ten, five out of twenty, seven out of nineteen, one out of six. Ivanowski¹⁶ mentions a case in Mongolia where a population of 500 families—some 6772 souls—gained only 58 births over deaths in ten years, the cause being an “enormous infant mortality.” The effect of an unfavorable environment on children is depicted by another author¹⁷ in the case of a tribe in Central Asia. The people live in rude cane huts, even though the winters are hard and the temperature drops down to -36°F. There is often lack of food and fearful famines result when the men fail to catch enough fish. In summer there are myriads of gnats and flies. The writer does not see how the little naked children stand it; day and night they are surrounded by stinging insects.

A long digging-stick, with which they dig up the roots of the wild yam, is the only agricultural implement of the least civilized Veddahs. “Wild bread-fruit and bark mixed with honey are the vegetable side-dishes with the flesh of animals slain by arrow (deer, apes, large lizards) and of fish procured through poisoning the water. The Veddah has attached the dog to himself as an attendant and aid in hunting.”¹⁸ Of certain natives of Borneo we learn: “Like the animals of the bush they pass a rambling life, caring only for the satisfaction of their subsistence-needs. They remain where nature affords them for a time sufficient sustenance, later to seek out new sources of existence. With tillage of any sort whatsoever they are wholly unacquainted; for food they use all sorts of animals, even the most loathesome, together with sago and

wild fruits. They do not want salt and believe that fatal sicknesses rise from the use of it."¹⁹

One is impressed, in the Gilbert Islands, by the incredibly small quantity of food needed to maintain life. "At the time of my visit," writes Finsch,²⁰ "a large part of the inhabitants of Maraki had nothing but *pandanus*, unripe coconuts, palm-sap, and small fish. A handful of the latter, together with a coconut-shell full of palm-sap, morning and evening, sufficed for the nourishment of an adult. The three-edged point of the green, unripe nuts, which did not yet contain any kernel, was knocked off, torn into four pieces and eaten. Although the famine had lasted a long time, over a year and perhaps more, these people still appeared tolerably well. To be sure, there were also at that time pitiful sights, but they were nothing in comparison with the pictures of human misery which I came to know so well in Tarawa or the famine types of Banaba. Here the few inhabitants abandoned their poor island following a famine, woebegone if not dreadful figures of skin and bones."

The standard of living of certain natives of Alaska is very low. "The wealthiest count only the following vessels and utensils in their subsistence department: one to three large kettles, one tea-kettle, one frying-pan, several wooden trays (native), several knives (generally home manufacture), horn spoons and two or three cups." Furniture was observed in only one place, that being a peculiar box in which to put tea-cups. "The average head of the family dispenses with all the above save one kettle, one or two wooden trays, a knife or two, and possibly a small cup, which he invariably carries whilst travelling."²¹ Nelson²² found villages among the Bering Strait Eskimo on the verge of famine; they had not provided sufficiently for the winter, hoping to be able to fish; then the winter turned out to be very severe and they could not fish. The same author states that in the winter of 1879-1880 famine and disease caused the death of at least two-thirds of the population on St. Lawrence Island in Bering Strait. He mentions another instance where the natives, getting whisky from a ship, had an orgy of intoxication at the time of the run of walrus, thereby neglecting to get their winter supply. Over one thousand died; the corpses lay all about two years later when he visited the place.

In McGuire's²³ *Ethnology in the Jesuit Relations* occurs the statement that "notwithstanding these periods of plenty, hunger and disease were constant visitors, and it is difficult to say which caused the greater mortality. When the snow was deep the moose was easily tracked by means of snow-shoes; but when the ground was bare or the snow was light, starvation was common, and after eating their skin clothing, and even the lacings of their shoes, the natives ate one another." Each year a period comes, just before the harvest time, when the Sia Indians must deal out their food in such limited portions that the elders go hungry in order to satisfy the children; "the expression of the men changes to a stoical resignation, and the women's faces grow a shade paler with the thought that in order to nourish their babes they themselves must be nourished. And yet, such is their code of hospitality that food is always offered to guests as long as a morsel remains."²⁴ Of one of the tribes of California Indians it is said: "They eat all creatures that swim in the

waters, all that fly through the air, and all that creep, crawl, or walk upon the earth, with a dozen or so exceptions.²⁵ Another Indian tribe used for food crows, ants' eggs, and the like, because of great economic distress;²⁶ still another "subsisted mainly on roots and seem never to have enjoyed plenty except in the season of the prickly pears. They ground the bones of fish, mixed the dust with water, and used the paste as food."²⁷ Fish are the staff of life of the tribes on the Amazon River; when they fail in one place the natives move their dwellings to another. The recent decline in the abundance of fish has meant a decline in the Indian population.²⁸ So severe is the struggle for existence in Paraguay that a nervous apprehensiveness is said to be the chief characteristic of the natives.²⁹

Reversion to the original state of destitution has occurred many times, through famine, among the ancient civilized peoples and in the modern era. The cases show how precarious has been the footing won by the race in its ascent from destitution. The stories of the Old Testament furnish familiar illustrations. Three famines are mentioned in the book of Genesis: one each in the days of Abraham, of Isaac, and of Jacob; in the last case, there was a general famine beginning in Egypt but subsequently spreading and continuing for a period of seven years. Another famine in the land of Canaan which lasted for a period of ten years is mentioned in the book of Ruth, and several others are recorded in later periods of Biblical history.³⁰

There was a famine in Rome in 436 B.C., so severe that the starving people are reported to have thrown themselves by the thousands into the Tiber. There was a great famine in Egypt in 42 A.D. In 650 A.D. there was a severe and general famine throughout India. In 879 suffering and starvation were so general that the year has come to be known as the period of the universal famine. In 941, 1022, and 1033 there were famines in India so terrible that entire provinces were depopulated and the practice of cannibalism became common. There were ten famines and thirteen epidemics in France in the tenth century. About the year 1000 there occurred a five-year famine throughout the Roman world, during which catastrophe people ate each other, and 1005 was a famine year in England. There was a ten-year famine in Egypt beginning in 1064. Famines were a regular occurrence in Europe during the eleventh and twelfth centuries. The one in Germany in 1125 is said to have destroyed one-half the population. In 1505 Hungary was devastated and children were eaten by their parents without official interference or censure. "All through the Middle Ages it was the practice of the city authorities to expel the neediest inhabitants to perish, and this was in accord with the public opinion of the time." Famines continued to be a common affliction in Europe to the middle of the seventeenth century and even occurred during the eighteenth. In Germany the last period of shortage so severe and uncontrolled as to be designated a famine occurred in 1817. It is often said that previous to the nineteenth century there was never a decade in which famines did not occur, while during

that century there took place the potato famine in Ireland and numerous periods of distress in India and China.³¹

How the mores tend to break down during such a calamity may be further illustrated by the following excerpt from a thirteenth-century Russian chronicle: "We were all in a fury of irritation; a brother rose against his brother, a father had not pity for his son, mothers had no mercy for their daughters; one denied his neighbors a crumb of bread. There was no charity left among us; only sadness, gloom and mourning dwelt constantly within and without our habitations. It was a bitter sight, indeed, to watch the crying children, begging in vain for bread and falling dead like flies."³²

§53. Labor.

PRIMITIVE people rarely show any of the discipline and prolonged application to a task characteristic of more advanced races. Labor is disliked by the aborigines of Victoria, and "unnecessary labor is to them simply impossible."¹ Work does not go off lively with the Kanaka; "they are not diligent and nothing induces them to hurry up with their work."² The Africans actually do not understand what it means to be in a hurry; "the characteristic condition of the modern, busy, civilized man, who 'never has time,' is entirely beyond their comprehension, and while we fix the hour or indeed the exact minute for the beginning of our work, it is incomprehensible to the African how one can keep at an appointed task for days and even for weeks. They always have 'time' and never anything to put off."³ The Indians of our Southwest and of northern Mexico really do considerable work, though they seldom hurry; like most primitive peoples they do not care to work for long stretches at a time.⁴ The Seminoles are said to be industrious, but by industry the author does not mean the persistent and rapid labor of the northern white men; he means only that these Indians are workers and not loafers.⁵

If the savage had more incentive to labor, he would undoubtedly apply himself to a greater extent. Somerville⁶ says of the natives of the Solomon Islands that "the people seem to make no use of their wealth; the mere fact of possession is sufficient, and *kalo* (whales' teeth), shell rings, calico, clothes—any article of European clothing is a great prize—are simply stored up, and scarcely worn or used at all. Neither is the desire for wealth very strong, certainly not strong enough to overcome laziness, except in rare instances." On the other hand, there are instances where savages will persist in work that appeals to them. This impulse is common to all the Indians of Brazil; "it is evidenced . . . by the lengthy and painful task of covering the entire body with tattoo marks, many of which are completed only in the later years of manhood, and by the care taken in the mummification of corpses; and . . . through the manufacture, extremely fatiguing on account of the lack of suitable tools, of dwellings, weapons and ornaments. With indefatigable persistence they cut the beams and sheathing for their huts with stone axes, be-

fore the whites brought them hatchets and knives, and with incredible assiduity they sorted feather after feather and worked them together with pitch and palm or cotton thread into elaborate scepters or fitted them into the meshwork of their head-bands and hats. The Indian is lazy where there is no personal interest in the work, but restless and industrious where work means the attainment of a satisfaction."⁷ Abel⁸ says that in his normal condition the Papuan is indolent, "but if you happen to catch him when he is in the mood for labor, and when he is working in company with his fellows, his activity and endurance will strike you as phenomenal." When work is made into a sort of game, the primitive man, like the child, displays perseverance. A sea-captain who saw much of the Eskimo says that they often make invention a part of their sport; they go out to certain difficult places, and having imagined themselves in certain straits, they compare notes as to what each one would do; they actually make experiments, setting one another problems in invention.⁹ The child of nature, who seems so care-free, nevertheless has his troubles; one ethnographer believes that he has many more cares than the civilized industrial worker.¹⁰

The savage does not like work for its own sake, for the stimulation it gives, for the sheer joy of striving, or for the satisfaction of accomplishment. The latter idea is really ultra-modern. An Australian once said: "White fellows work, not black fellows; black fellow gentleman."¹¹ A somewhat similar notion was quite common in antiquity,¹² excepting always the sentiments of the Jews. The Jewish God was a worker, not a reveler like Jupiter nor a loafer like Buddha; the rules regarding agriculture were considered as precepts emanating from God himself.¹³ In Proverbs appears an exhortation against idleness, which is mentioned as the cause of poverty and want.¹⁴ Young men should work for their support; he that will not work should not eat.¹⁵ In Rabbinical literature occur such dicta as these: "No work, however offensive, is as degrading as idleness"; "Idleness imperils life"; "Seven years a famine may last; but it will not enter the door of the artisan."¹⁶

In some instances primitive lack of industry is owing to the fact that the people, by reason of the exuberance of nature, have no incentive to labor. Laziness is said to be the heritage of all Pacific races—the result of the extreme fertility of a land which gives them no occasion to work in order to live.¹⁷ Consider, for instance, the bread-fruit tree, whose melon-like fruit weighs one and a half to two kilograms, and is the chief food-supply. Capt. Cook once stated: "If a man, in our harsh climate, works the whole year through, to plow, sow and harvest enough to support himself and his children and to save a little with great pains, he does not fulfil his duty to his family, after all, any better than a South Sea Islander who has planted ten bread-fruit trees and never done another thing."¹⁸ Such conditions tend naturally to idleness. Easy existence is also afforded by the sago palm and with the same result. Wallace¹⁹ has said that "the effect of the cheapness of food is decidedly preju-

dicial, for the inhabitants of the sago countries are never so well off as those where rice is cultivated. Many of the people here have neither vegetables nor fruit, but live almost entirely on sago and a little fish. Having few occupations at home, they wander about on petty trading or fishing expeditions to the neighbouring islands; and as far as the comforts of life are concerned, are much inferior to the wild hill-Dyaks of Borneo, or to many of the more barbarous tribes of the Archipelago." Two men can convert into food the trunk of the sago tree, which is often over 20 feet high and four or five feet in circumference, in five days, and two women will bake the whole into cakes in five more days, though the raw sago will keep very well and can be baked as wanted. This will give food enough to maintain a man for a whole year,—a year's maintenance for ten days' labor! If a man does not possess sago trees of his own, he must pay about seven shillings and sixpence for one; "and as labor here is five pence per day, the total cost of a year's food for one man is about twelve shillings." In spite of, or rather because of, the abundance and cheapness of one kind of food, the inhabitants are poverty-stricken. The people live in "that abject state of poverty that is almost always found where the sago-tree is abundant. Very few of them take the trouble to plant any vegetables or fruit, but live almost entirely on sago and fish, selling a little tripang or tortoise-shell to buy the scanty clothing they require."²⁰ Poor despite the bounty of nature, indolent because of it—such is also the situation in the Caroline Archipelago. Though the island Sonsol is covered with rich vegetation, coconut trees are not numerous and therefore do not suffice for the maintenance of the population, especially since the custom prevails of using the nourishment of the palm not in the form of the fruit but in that of palm wine. This substance, taken three times a day, is their chief sustenance. The bread-fruit trees yield their usual two harvests a year, at which time a relative superfluity, instead of the more general want, ensues. "It is unfortunately true that the indolence of the people is the cause of their general destitution. No effort is made to put by a store of provisions." Though the island is extremely fertile, so that a number of nutritious plants thrive there, yet they are not cultivated. The inhabitants look upon St. David Island as Eldorado, because there is to be found an abundance of coconuts.²¹ A cheap food-supply in other places is the banana. According to Humboldt,²² the productivity of the banana is to corn as 133 is to 1, and to potatoes as 44 is to 1. In the New World, the Arawak Indians had little stimulus to industry and trade, for three or four months' labor in the field produced supplies for the year;²³ Hostmann²⁴ says that for the negro of ordinary physical powers "two hours' work a day is more than sufficient to support himself, a wife, and several children, more or less."

Existence is easy in the Chin Hills of India. "It is commonly supposed that the Chin is a wretched, half-starved, over-worked and generally unhappy being. The reverse is the case, and if his labor in agriculture be analyzed, which is his hardest work, it is found that in reality he has an easier time than the farmers in the west of America and in the colonies. . . . The one hardship that attends agriculture in the hills is that the Chin has to work in

very heavy rain for some months. His constitution is, however, hardened to this, and it does not affect his health in any way. The Chin instead of being pitied is to be congratulated that he can make his living so easily, and that he has not to stack straw and hay, build outhouses for cattle and machinery, and protect his cattle from the weather; he has no great heat and no terrible winter to contend with, and he always has three meals a day, a roof over his head, and all the clothing he needs."²⁵ It is largely, however, because of his easy living that the Chin is undeveloped; cheap food is not always a blessing. In Kashmir "it seems as though the ease with which a living can be made were the chief cause of the reputed idleness and laziness of the people; and laziness, aided, perhaps, by the opportunities for dishonesty afforded by the large amount of local traffic and barter which the abundant waterways foster, may be responsible for much of the untrustworthiness which is said to be so prominent a trait of the Kashmiris." Lack of incentive is characteristic of the Chanto, another Asiatic native. "There is nothing to tempt him out of his small oasis; nothing to waken him or to arouse determined effort. His work in summer may be hard for a time, but it rarely hurries him, or causes him anxiety. He knows that the water will be turned into his ditch on such a day; his crops must be cut at such a time, and all the family must work, but bad weather never seriously interrupts the harvest, and a delay of a day or two will do no harm. And so year after year, and generation after generation, the Chanto goes his care-free, monotonous way, and grows gentle and mild and weak of will. He has no contact with the world outside his own oasis, and therefore fears whatever is new or strange. The Chanto's mind is so habitually idle,—that is, it receives so little stimulus from his ordinary surroundings,—that new sights and new ideas do not interest him, and he is strangely free from curiosity, nor does his easy, quiet life often tempt him to quarrel. In winter, he sits idle with nothing to occupy his thoughts, and naturally eating and drinking and the pampering of his body become the chief things in life. It would be strange indeed, if, under the given physical conditions, the Chanto were other than the courteous, submissive, self-indulgent creature that he is."²⁶

Apropos of the incitement to labor residing in spirituous drinks, Dr. Harvey²⁷ remarks upon the sailor of aforetime. Fortunes were made in shipping by reason of the low wages paid to seamen, especially by Scandinavian, German, and even English owners. Shipmasters almost invariably had to put to sea with drunken crews. At the end of a long voyage in a sailing-vessel, the common sailor quickly disposed of his small and hard-won earnings in one or two wild drinking-bouts and was then obliged to go to sea at once at whatever wage an unscrupulous sea-master might choose to offer. With the advent of steam-ships, quicker voyages, and better wages, conditions have changed and the sailors' standard of living has risen. The crew work harder than was usually the case in sailing-vessels, and hold on tighter to what they get.

§67. Specialization in the Food-Quest.

WHEN all things were ready, runs a legend in the Solomon Islands, the *figona* bore a child, who grew up to be a man, but he was helpless in such matters as

²⁵ Carey and Tuck, *Chin Hills*, 213.

²⁶ Huntington, *Pulse of Asia*, 28, 235-236.

²⁷ Personally communicated.

cooking, making a fire, and weeding a garden. When the *figona* saw this he gave birth to another child, a girl, who grew up to be a woman and understood these matters: "Be it your part," said the *figona* to the woman, "to get food and prepare it by cooking and distribute portions of it." And so it has been ever since.¹

Woman's share in the food-quest naturally differs according to the stage of development of the tribe. Among hunters, such as the American Indians, she gathered and stored the edible roots, seeds, berries, and plants for future use, and dried and smoked the meats brought by the hunters. To the men fell the important task of supplying the tribe with meat and most of the materials for clothing. We are told in some instances of hunters who go out accompanied by their wives to visit the hunting-ground.² Women often aid in fishing. In Tasmania the women were accustomed to dive for shell-fish, which they placed in a rude basket tied round the waist.³ Among the Papuans, "the duty of catching crabs is entirely that of the women, and men consider it derogatory to do so."⁴

More significant in primitive household economy is woman's work in agriculture. In the legend which recounts the coming of the Caddo from the underworld it is related: "First an old man climbed up, carrying in one hand fire and a pipe, and in the other a drum; next came his wife with corn and pumpkin seeds."⁵ In southeast Papua, the men clear the land for cultivation and dig the ground for yam-planting; the women then plant the seed and weed the garden. As the seed sprouts the men fix the poles for the vines to climb upon. The women harvest, store, and look after the supplies. Men are not supposed to take a yam from the storehouse, even if hungry, without the consent of the women. "The highest attribute ascribed to a woman is that of being 'arawata,' which means that she is a good gardener, and strong in caring for the food supplies. To be the possessor of a large supply of good yams in the storehouse, when the new crop is growing, is the best sign of character."⁶ To help support the male portion of a family, a young Papuan girl will be early espoused to a boy and be required to provide food for her little prospective husband. "The Papuan women are slaves or beasts of burden in the family, but the Malay-Polynesian females are treated with considerable deference and regard."⁷ Among the Shendoos of India, by way of exception, "field labor as a general rule, is performed by the men; only the wives of very poor men labor in the fields."⁸ Among the Semang tribes of the Malay Peninsula who have reached the agricultural stage, the men do the felling and heavy clearing, whilst the women do the lighter clearing and lopping of branches, as well as the sowing and reaping, and not infrequently the tilling of the soil, if the scratching of its surface with a pointed stick can be so called. The men, again, do most of the hunting and trapping, but the women take a large share in the fishing and in the collecting of roots and fruits.⁹

That monotonous duties like weeding more commonly fall to the woman is

seen in the following quotation: "The girl too plants and weeds her plot. Her brother or a near kinsman will do the heavy work for her, will fell the scrub and build a fence; for this is the man's work always. In return she will do the woman's work for him, and weed his garden in addition to her own. For almost the only man who weeds is the solitary widower."¹⁰ Women do the weeding among the Tupis of Brazil, the Baganda of Central Africa, the Tibetans, the Micronesians, and others.¹¹

When a Zulu household makes a new settlement, the men clear up the land; subsequent cultivation is the affair of the women, except that the heavier field-labors are carried on together. At the harvest, men, women, and children all work together.¹² Among the Wachaga of East Africa, men take a greater share in field-labors than is usual among Africans; they keep the irrigation-canals in repair and in general attend to the irrigating, and they break the new ground.¹³ With the Ba-Huana, the clearing is done by the men; the rest of agriculture is left to the women.¹⁴ Fields for millet are roughly dug by both men and women towards the end of the dry season, with the Bageshu, and directly the rain comes the grain is sown. "Both sexes take part in the sowing; . . . both men and women go out to reap it and bring in each night what they reap. . . . Both men and women work amongst the plantains, but the weeding of the grain crops devolves upon the men."¹⁵ "Among the Sungu all work connected with agriculture is performed by women; this is not so among the forest-dwelling northern Batetela, where the superior strength and skill of the men is necessary to remove the trees."¹⁶ The Baganda women do all work on the plantain-trees, which is not heavy, once the ground has been broken up and the young trees planted; the girls are trained to garden from six years old; even ladies and princesses doing it. It is a great honor to have a good garden, a disgrace to have a bad one.¹⁷ The Baganda men are the hut-builders, the women being given over to agricultural pursuits,¹⁸ while in the Upper Congo district it is said that "the food belonged to the woman who cultivated the farm, and while she supplied her husband with the vegetable food, he had to supply the fish and meat and share them with his wife or wives."¹⁹ As among nearly all African tribes, the Akamba women do all the work in the fields and are also hewers of wood and drawers of water.²⁰

In America, the unwarlike California Indians treated their women well and shared their work.²¹ It would seem here that when man's characteristic speciality of war is in abeyance, strict sex-division of labor tends to disappear. Among the southern and western tribes, the men helped in the field-work; among the Natchez, "the ground was cultivated and prepared by the warriors alone, and the women were not allowed to take any part in the work at any stage." As the crop in this extreme case was destined for a harvest festival, such an exclusion of woman probably goes back to some religious taboo.²²

Among the Attacapa, "the women alone were charged with the labors of the field and of the household."²³ Mason²⁴ states that the aid received by Indian women in tilling the soil varied, "being greater among the tribes south of the Ohio and less among the Iroquois or Six Nations." The latter had a strong military system and their women possessed considerable influence and organization. Among the Omahas, "the women had an equal standing in society, though their duties differed widely from what we imagine they should be. On cold days, when the husband knew that it was difficult for the woman to pursue her usual occupations, he was accustomed to go with her to cut wood, and he used to assist her in carrying it home. But on warm days, the woman used to go alone for the wood. . . . When a woman was strong, she hoed the ground and planted the corn; but if she was delicate or weak, her husband was willing to help her by hoeing with her. The woman did the work which she thought was hers to do. She always did her work of her own accord. The husband had his share of the labor, for the man was not accustomed to lead an idle life."²⁵ Much of this primitive division of labor was forced by the exigencies of life; the case of the Pima Indians is illustrative: "The men may be forgiven for allowing the women to perform certain tasks in the cultivation of the crops that are usually considered the portion of the stronger sex when it is learned that this plan was necessary in order to maintain pickets constantly for long periods, and that an armed guard was the sole guaranty of safety to the village. Every three or four days small parties of five or ten would come to steal live stock or to kill any individual that might have gone some little distance from the villages. Larger war parties came once or twice a month, though longer periods sometimes elapsed without a visit from the Apaches."²⁶

It has been noted that when minute specialization comes about, it is likely to leave man in charge of the more interesting activities. In Efate (New Hebrides) man and wife work on the plantation together, each having a special plant, and a share in one that is cultivated jointly.²⁷ In this case, there is no specification as to the identity of the plants, but in Micronesia it is the betel and tobacco, that is, the luxuries, which occupy man, while the women cultivate the commonplace taro.²⁸ Similarly, among the Shingu Indians, the man raises the tobacco, which the woman does not use;²⁹ and in Massachusetts the men cultivated tobacco, the women the rest.³⁰

"To the modern mind it is surprising to find the processes of agriculture conducted in the main by women, and mirroring themselves in the figures of women-goddesses. But in days when man was mainly concerned with hunting and fighting it was natural enough that agriculture and the ritual attendant on it should fall to the women. Moreover to this social necessity was added, and still is among many savage communities, a deep-seated element of superstition. 'Primitive man,' Mr. Payne observes, 'refuses to interfere in agriculture; he thinks it magically dependent for success on woman, and connected with child-bearing.' 'When the women plant maize,' said the Indian to Gumilla, 'the stalk produces two or three ears. Why? Because women know how to produce children. They only know how to plant corn to ensure its germinating. Then let them plant it, they know more than we know.' Such seems to have

been the mind of the men of Athens who sent their wives and daughters to keep the Thesmophoria and work their charms and ensure fertility for crops and man."³¹

§68. Specialization in Handicrafts.

Food-Preparation. Cooking and preparing food are traditional feminine occupations, and among hunters and fishers it is often woman's task to fetch whatever game or fish the men may have caught, cut it up, clean it, and prepare it. Cooking is found to be woman's prerogative among such scattered peoples as the Araucanians, the Guiana Indians, the Baganda and Atharaka of Africa, tribes of the Malay Peninsula, and others.¹ In some instances, men share this task with women. In Southeast Papua, "the men make sago and do most of the work in the preparation of special puddings. The women prepare the ordinary meal by boiling, the men being allowed to roast yams or bananas,"²—the more special or interesting things being, again, the activities of the men. In Eastern Polynesia the cooking is performed chiefly by the males; even chiefs will take part in the culinary operations. "A great variety of tasty dishes are prepared by them, and both the preparation and the cooking are very cleanly. . . . The Papuans leave the cooking and all its preparations to the females of the family. . . . Here the food is cooked in a hotch-potch manner,—fish, fowls, vegetables and fruit are baked in one large bundle, and very little care is taken in cleansing anything."³ Among the Wataveita, near Kilima Njaro, men alone make fire by friction; the process is a secret from women;⁴ by the Banziri, women are taken along in the boats to do the cooking and to keep a fire always burning on an earthen hearth.⁵ In the Egyptian Sudan, the men are quite willing to cook, but not to grind the meal; they prefer rather to eat the durrha-grains unground, simply roasted over the fire,⁶ not being able to bring the woman's work of grinding into consonance with their masculine dignity.

Among the Palaungs of Farther India, "the mixing of the ingredients to make the different curries, and the cooking of the vegetables and the leaves of trees with curried gravies is usually done by the mother; if meat is added to the mixture, the cooking is generally done by the father himself. Many Palaung women do not eat meat in any form, and it is not often given to children."⁷ In Rotuma, however, the men make the fires and cook the food, an operation never performed for them by the women.⁸ In the Pelew Islands cooking is the specialty of men; in the Mortlock group, of women;⁹ and in the New Hebrides women may not cook or even touch their husbands' food.¹⁰ Again, men are not at all ashamed of cooking and every man knows how to do it just as well as a woman.¹¹ The Shingu men roast their own fish and meat, while the women bake cakes, boil drinks and fruits, and roast palm-

nuts; the men roast food, but never boil.¹² By contrast, among the Lapps, "all boiling of meat is, according to old tradition, the affair of the house-father. The mother must attend only to other kinds of boiling, the roasting of meat and fish, preparation of soup, coffee, and the like, and the making of cheese."¹³ And finally, to take the evidence of a survival, Roman women prepared bread for feasts and house-sacrifices; they alone celebrated the festivals of Vesta, and their sacrifice was bread. Men, on the other hand, prepared the meat that was sacrificed on occasion.¹⁴

Clothing, etc. Both sexes share in the preparation of skins and other materials and the making of clothes, though the following cases indicate that such tasks more commonly fall to the men.

Among the Teda, a tribe of robbers in the Sahara, "the business of sewing is exclusively in the hands of the men."¹⁵ In East Central Africa the men do all the sewing on their own and on the women's garments.¹⁶ On the Loango coast the men alone weave; no woman may lay hand on the cloth before it is clipped.¹⁷ In Tibet, the men invariably knit the coarse woollen socks that are in common use; "whether in the house or journeying, the men are never seen without the distaff. They also weave, and make the clothes of the women and children!" Rockhill,¹⁸ who thus reports on the Tibetans, goes on: "It is no unusual thing, in Mohammedan countries, for men to knit. The writer has noticed it in Algeria, the Friar Odoric, speaking of the people of Huz, in Persia, says of them: 'and 'tis the custom for the men to knit and spin, and not the women.'" Among some of the American tribes skin-dressing, the weaving of suitable fibers into fabrics and other articles of necessity, the making of clothing and of mats and mattresses were done by the women. In other tribes, both men and women performed these tasks, either each sex making its own clothing or the heavier part of such tasks as weaving being done by the men, the lighter by women.¹⁹ In still other instances—and these are more numerous—skin-dressing, sewing, weaving, and the manufacture of clothing are men's occupations. Among the Hopi Indians, the women do not make the garments and blankets, but the men; a Hopi woman does not make even her own moccasins; the men do all the sewing and embroidery.²⁰ Among the Navajo, and in some of the Pueblos, men are among the best weavers.²¹ The greater part of the buckskin clothing, including leggings and moccasins, for both sexes, was made by the men.²² Since weaving, among the Jibaro Indians of Ecuador, was an industry exclusively incumbent on the men, they always made the clothes of their wives.²³ The Bororo men, in Brazil, did the spinning, so that the house of the men was the spinning-room.²⁴

Among the Pacific islanders, women generally weave the mats; near Torres Straits the men consider it derogatory to do women's work, and refer to the making of mats as such.²⁵ Among the Australians, the women chewed the grass-roots of which fishing-nets were made, to render them soft; but the

men made the mats.²⁶ Andamanese women make all ornaments, whether for themselves or their relatives.²⁷

Transportation and Trade. Primitive women are commonly the pack-animals. The Samoan woman carries her husband's reserve of arms to war.²⁸ This is but a type of the subsidiary services of the sex at such a time. Similarly in hunting. Among the Eskimo, "when a man brings home a seal in tow, on reaching the land he pays no heed to anything but himself and his weapons, which he carries to their places above high-water mark. They do not even look at their booty as it lies on the shore. The rest is all the affair of the women." It is beneath dignity for an Eskimo to have to do with the woman's boat, the *oomiak*. It is a freight-boat; he occupies the light hunting-craft, the *kayak*.²⁹ In one Algonquin tribe, "the women perform all domestic work, including the transportation of game, fetching the fuel, erecting the tipis, hauling the sleds when traveling, etc.; the men are the providers."³⁰ The Colorado women are virtual slaves; in their wandering excursions they load themselves with everything necessary, like beasts of burden. They even fetch from the forest the game killed by the men.³¹ This last duty is not uncommon among hunting tribes; and in general, the women have to find and carry the fuel; an exception is where, among the Dyaks, "one of the first duties of a husband is to provide this, or he gets into bad odor with his wife or mother-in-law."³² A typical picture of a primitive family on the march would show, as among the Pima Indians, the male proceeding first, unencumbered save for his weapons and sometimes mounted, while his wife laboriously followed afoot with her child and a heavily laden burden-basket and on her back most of the family's possessions.³³ The man must be free and ready to protect his family at a moment's notice. The Kagoro of Nigeria never voluntarily carried anything other than his hoe or his weapons; all loads are borne by women.³⁴

In the matter of trade, women often discharge a special function.³⁵ East African women, besides tilling the soil and carrying loads, also attend markets and play spy and intermediary between provinces even in war.³⁶ Among the Northwest Indians, "originally the chiefs conducted the trade of the tribe, but in time the natural abilities of the other sex in driving bargains has resulted in the predominance of the influence of the women in such matters."³⁷ Similarly, it is reported of the natives of Nicaragua that the women pursued trade, while the men cared for the domestic labors; at the slightest provocation the man was expelled from the house of the woman;³⁸ while Herodotus³⁹ says that among the Egyptians "the women buy and sell, the men abide at home and weave."

Miscellaneous Cases. The heavier tasks connected with house-building are commonly performed by the men; it is their job to cut, haul, and set the heavy posts and beams. The lighter tasks, such as thatching, are woman's work.

Where the hut or tent is made solely of skins, as the Indian tipi, the women may do all the work.⁴⁰

The Papuan men make the canoes, and "in the last stages of the making of a war-canoe the women were not allowed even to go into the shed where the work was approaching completion."⁴¹ Again, only the men ever carve; "some are naturally more skilful than others, and are consequently often engaged by their neighbours to carve their canoe-heads. . . . Women are unable to carve, simply because they never make use of the adze; it is as typically the tool of the men as the shell knife is of the women."⁴² In Samoa, "all objects made by men, and the tools in making them, were called *oloa*, and those made by women were called *tonga*. . . . *Oloa* included houses, house utensils, boats and boat utensils, weapons, tools, nets used for fishing and pigeon catching, certain ornaments, and all foreign articles obtained from other islands, including in more recent times white men's productions. *Tonga* included mats of different sorts, bark cloth, fans, combs, baskets, etc."⁴³ This case is very typical and needs only to be expanded to include, among the male occupations, those which border on the ornamental and artistic and in some instances the religious. Thus, among the Omaha "all rituals and religious rites were in charge of men; therefore the painting and tattooing of symbols devolved on them."⁴⁴ With the Guiana Indians, all musical instruments were the prerogatives of the sterner sex.⁴⁵

Pottery is generally made by the women.⁴⁶ Serpa Pinto⁴⁷ records, as an exception to the general custom of the region, that in Cangamba it is the men who make the cooking-pots. On the Zanzibar coast the women shape the pottery and color it with graphite; in Guiana, even though the women make all the pottery, yet the ornamentation is as often the work of men as of women; in New Guinea the Papuan women do none of the ornamentation—are thought, in fact, by a competent observer, inapt for the function.⁴⁸ In Mashonaland, women are the great brewers and "a good wife is valued according to her skill in this department."⁴⁹

Shaving, curiously enough, is regarded as a feminine occupation in the Andaman Islands, the men shaving each others' heads only when the services of a woman are not available; every woman is supposed to be proficient in shaving, tattooing, and scarifying, and tattooing is almost invariably performed by women.⁵⁰ The same custom prevails in Africa among the Becwana, who hold that men are but bunglers at shaving.⁵¹

The above cases depict the usual sex-differentiation in regard to the handicrafts, indicating that the domain of each sex is fairly well marked. A case striking in its exceptionality is that of the Seminole Indians: "There is little

difference of function in either family or tribe. Men hunt, women take care of the house; both work the fields. Men sometimes do the housework and women field work. Men hunt and women fish. Both are tailors, shoemakers, flour-makers, cane-crushers and syrup-boilers, wood-hewers and bearers, and water-carriers. There are but few domestic functions which belong exclusively to one or the other."²

§72. Rudimentary Specialization.

AMONG some of the Melanesians, canoe-makers formed a distinct craft. "The canoe-makers may belong to any division and the occupation is hereditary, the art passing usually from father to son, though others may learn the craft. The Tikopians make very good models of canoes and a man who wishes to become a canoe-maker will make such a model. If the people approve this model the beginner will be encouraged to make the real article which he must do alone in the bush, and if it is well made he will probably be asked sooner or later to act as a *tufunga* and make one professionally. There is no formal instruction and nothing of the nature of apprenticeship. When a man is making a canoe on trial he has to cut down the tree single-handed and the labour of doing this is so great that it deters all except those who are very much in earnest. . . . Tumeric-making . . . like canoe-building is hereditary but may be taken up by others who learn the necessary procedure. . . . The third class of people who are called *tufunga* are the tattooers. The occupation may be combined with canoe-making and dyeing or may be practised separately."¹

The Polynesians had a highly developed division of labor. In Hawaii there were boat-builders, carvers, house-builders, and even roofers.² In Samoa, besides tillers, there were carpenters, canoe-builders, makers of fish-nets and hooks, surgeons, and tattooers, the functions of the last two being strict monopolies of certain families. These specialists also had assistants: those who cut wood and plaited sinnet for the carpenters, prepared cord for net-makers, and sought herbs for doctors.³ House-building here was a distinct trade and on an average one among every three hundred men was a master-carpenter. "Whenever this person went to work he had in his train some ten or twelve, who followed him, some as journeymen, who expected payment from him, and others as apprentices, who were principally anxious to learn the trade."⁴ Williamson⁵ makes the following general comments on specialization in Polynesia: "*Tufunga* was a term applied . . . to a carpenter, and a tattooer; but it seems to have had the wider meaning of an artisan, skilled in the making of certain articles or the doing of certain things. Stair gives a list of thirty-one different occupations of this character, the name of each of which begins with *o le tufunga*, and we shall find that in parts of Polynesia a corresponding term was used for a priest—that is, I imagine, a person skilled in the art of prayer . . . carpentry and tattooing were, in the main, specially esteemed. . . . Some of the occupations were common to all places and parties, but others were confined to certain localities, and practised by fraternities, who guarded zealously their privileges from any infringement. . . . None of these occupations was strictly hereditary, though certain families, the members of which

had practised the several trades for many generations, acquired a special prestige. . . . Each principal trade or employment . . . and each trade . . . had its presiding god. . . . Even some of the chiefs were accustomed to engage in the different handicrafts common to the people, . . . there was no degradation attached to work, and the most skilful man, whatever his position might be, was always the one most sought after for work."

Among the Indians of the northwest coast, "different men and women acquire adeptness in different arts and industries, and devote their leisure to their trade. Some of the men are expert house-carpenters, canoe-builders, basket-makers, tanners of hides, hewers of wood, metal workers, carvers of stone, horn, bone, slate, wood, manufacturers of metal implements, ornaments, household utensils, etc., and are regularly paid for their services. This is especially true of the wood-carvers, who make and paint the totemic and mortuary columns. Others enjoy prestige as successful hunters of certain animals or expert fishermen. Some of the women are expert basket-makers, carvers of house-utensils, weavers of cloaks and mats of cedar bark and wood, and makers of dance and ceremonial costumes. Generally the men are carvers and the women weavers."⁶ There was no special class of craftsmen in Peru; "trades were pursued along with agriculture and cattle-raising. But some persons among the villagers had gained a certain especial dexterity in one, and others in another branch of industry; some were reported to be weavers, others as good potters or metal-workers."⁷ The stone graves of Tennessee contain sets of tools of various artisans, from which may be inferred a considerable specialization.⁸ Most of the Indian tribes had men who were experts at stone-chipping and could decide instantly on the best mode of flaking a particular stone. It is a work of no little care and skill to make even so rude an instrument as an arrow-head, and only the most expert were very successful at the business.⁹

Among more advanced peoples specialization was still rudimentary. The case of the Homeric Greeks may be taken as typical. A craftsman important enough among them to bear a designation, though of a vague order, was the "builder." The term was a broad one; for this functionary made articles whose basis was wood, handling, like the smith, any accessory materials. The whole craft of wood-working was little specialized within itself; the builder regularly went to the mountain for the stuff he needed, and cut it down himself, though sometimes wood-cutters appear to have been a separate class. There was a qualitative distinction between skilful and less skilful builders, a fact which indicates that a number of men were engaged in the occupation; but the lord of a house and even of a people may appear as his own master-workman. The builder was also ship-builder and made even the sails; he constructed chairs and worked in ivory and gold in decorating them; and he was the regular house-builder. The chariot-maker was not called builder, and seems to have been a separate craftsman; he did the work in iron and leather which chariot-making required. A prince is found working at his own chariot. Stone-work seems to have been done by unspecialized workmen. A shield-cutter is mentioned; but most leather-work and sewing were domestic. Grain was crushed in hand-mills by female slaves. Pottery and the potter came in for little atten-

tion. Basketry, rope-twisting, tanning, and minor operations show no specialization; all the industries might be grouped under home-manufacture, smithery, and building. There were no special merchants, sailors, or oarsmen among these Greeks; the word sailor refers to a sea voyager rather than to a professional seaman. The function of pilot, steersman, and steward was of no special significance; it took a prophet to guide the ships to Troy. Those steered or piloted who were the most adept at it, but it was not a profession. There was a class of fishermen among the poor, who became carriers when the chance offered; and there were divers who got shell-fish and sponges. Naturally no strong or consistent social distinction had had time to grow up and surround certain specializations with the distinction of class, much less of caste. The social specialists, or workers for the community, are listed as seer, physician, builder of timbers, and bard.¹⁰

The Smith. Most important among primitive craftsmen, and certainly most interesting, is the smith. His position is generally peculiar; he is revered in some places, despised in others. Most of the evidence concerning the primitive smith comes from Africa. African smiths often form a special class or even caste, and their function is in many cases hereditary. They are honored as skilled men by most of the tribes and their craft is regarded as a noble or at least a very important and useful profession, which frequently confers special social and political rights; in some places the blacksmith is called "the iron doctor."¹¹ In Kaarta the smiths form a privileged caste, and, along with the royal family, are not liable to capital punishment.¹² With the Atharaka "the smiths are regarded as distinguished men . . . and their portion of the meat is always the shoulder. They are permitted to marry as they please, and there are no restrictions imposed on them in this respect, as I gather is not infrequently the case amongst other African tribes."¹³ The smith is commonly regarded as a neutral, is not killed in war, and may be induced by the victor to settle in the latter's district and there ply his trade.¹⁴ He often lives outside of the village, near the iron mines, and his smithy is sometimes a meeting-place.¹⁵ In a few instances we find him a political leader.¹⁶ Among the Tuareg of the Sahara the smiths are much esteemed, coming immediately after the nobles in the social classification; and the same obtains in certain central African states founded by the Berbers.¹⁷ Among the Arabs they are exempt from taxation and even get some customary dues in kind, in exchange for gratuitous services to particular men.¹⁸

On the other hand, the African smith is sometimes regarded as an outcast, or is feared and hated. No free Somal sets foot in a smithy, shakes hands with a smith, takes a wife from among them, or gives his daughter to one.¹⁹ Among the Galla and other tribes of Africa the smiths form a subjugated and despised

caste, though in some instances they are held in bondage on account of their skill.²⁰ In the Sahara, the smith is to a certain extent a pariah. "To call anyone a smith is an offence which can be atoned for only by blood. No one gives his daughter in marriage to a smith; no one lets his son learn such a trade; no one keeps up friendly relations with this outcast. The craft is transmitted from father to son and, since the children of smiths marry only among themselves, the caste remains pure and unmixed. Moreover, there is much to indicate that this contempt is mingled with another feeling. For example, no one would make bold to injure a smith, so deep is the scorn with which he is regarded; even to raise weapons against him is viewed as a very great dishonor. Despite the fact that the Mohammedan negroes have many legends to the effect that formerly a smith covered the entire craft with eternal ignominy through offending against the faith and betraying the Prophet, the custom of regarding him as a strange, unprotected, and outlawed creature is certainly of pre-Islamic origin; for a similar ostracism of the smith, whether it be that they are revered as wise men or feared as evil sorcerers, occurs among the heathen tribes of Africa, as in less civilized lands generally and even in places where Islam has never played a rôle."²¹

The different sentiments with which the smith is regarded are really not contradictory, any more than are the concepts "holy" and "unclean." As the text explains, he is a sort of fetish-man; his art, being beyond the comprehension of primitive people, is mysterious or supernatural and himself a magician or sorcerer. How the two views of the smith blend and unite may be seen in the following quotations: "The smith's trade was highly esteemed in the Congo, as being of royal origin, while among the Mandigoes it is so despised that the people have no intercourse with this class of craftsmen. Among most of the warlike tribes the position of the smith is an exceptional one and in the skirmishes of the Kabyles his life is spared if he is recognized on the battlefield, for his person, on account of his serviceableness, is sacred, like that of the physician among other nations. Elsewhere the metal-worker is persecuted as a wizard. These different points of view are explained easily enough in the nature of the case. If a worthy art has been acquired from a more highly civilized and friendly people, it would naturally be admired or taken under the protection of the kings themselves. If, on the contrary, a conquering people finds it in the subjugated land, it will similarly be utilized, although relegated to a subordinate position—all the more so if the people believe they have reason to fear it on account of its mysterious nature."²² Among the Teda, "the utterances of the smith's wife are held to be oracular, and in case of sickness if there is no physician or medicine-man at hand, recourse is had to the sword-cutler. To strike or kill a smith is regarded as a great crime or rather as an act of cowardice. But—strange contradiction!—no Teda would eat with an armourer or sleep under his roof or marry his daughter. To call a Teda 'armourer' is one of the grossest insults, which can only be wiped out by blood. I have searched in vain for the cause of this peculiar position of the smith

among the Teda, which appears to be based, on the one hand, upon great reverence, and, on the other, upon just as great contempt."²³

The blacksmith in Abyssinia is looked upon with mingled dread and superstition. He is supposed to be able to communicate the devil to whomsoever he will, and to be able to turn into a hyena and commit ravages on his enemies;²⁴ all through Africa, but particularly in the East, smiths are suspected of lycanthropy, their souls being supposed to leave their bodies at night, enter beasts, and practise cannibalism.²⁵ The Masai of East Africa regard smiths as unclean.²⁶ By the Kikuyu it is thought that if one sleeps in a smith's house, illness or even death will supervene. Smiths are believed to possess magical powers which they obtain from the tools of their trade—from the fire, the iron, the bellows, and the anvil; if, for instance, a smith is forging a weapon and when it is white hot he plunges it into water, saying, "May such and such a village cool as this iron is cooling," evil effects will fall on the village. Only that smith or another can remove the spell; a medicine-man has no power over a smith's magic.²⁷ Owing to his association with iron, the blacksmith among the Hausa is a person to be avoided, "for this metal usually makes his breath smell badly. If not, beware lest the breath should burn your clothes and even your flesh. No females, except young girls, are allowed near smelting works or forges, for the iron would never harden if women were present. . . . The butcher and barber also are dangerous persons, for they are just as much in contact with blood as the blacksmith is with iron; and both are *haram*, almost meaning *tabu*. All these classes are despised, and should be made to marry amongst themselves."²⁸ A worker in iron is looked upon by the Dinkas as particularly likely to possess the evil eye; "he is believed to injure cattle by looking at them, and so unpopular is he, that he finds it very expensive to buy a wife and very difficult to dispose of a daughter." The Jurs, who are great iron-workers, are believed by all their neighbors to be very malevolent and greatly skilled in witchcraft.²⁹ Other negroes believe that if a person in whose family the smith's art is not hereditary should build a workshop, he will die. Why? "Because the hammer of the smith is a godhead, and it can not calmly see such bungling work; the deity will afflict such a person with sickness and bring him to his death."³⁰ In West Africa, the smith's trade is to a certain extent holy and permitted only to chiefs, and the smith has certain priestly functions; upon him devolves the duty of making the nails which are put in idols to prevent or detect theft. This is true not only of the Congo peoples but of the negroes in the river-basin of the Ogowe as well. Among the Fan the smith is also a priest, and some tribes, not familiar with smithery, hang the peculiarly constructed bellows, which are common to all equatorial Africa, in their fetish-houses as objects of reverence.³¹ Rather generally in Africa the smith functions as priest, while certain ceremonies are consecrated with his hammer.³²

The fetish-character of the smith is clearly seen in the case of the Yakuts. "Smiths stand in a close and peculiar relation to shamans. Popular sayings

are: 'Smiths and shamans come out of one nest.' 'Smiths and shamans stand on the same plane.' 'The wife of a shaman is to be respected; the wife of a smith is worthy of honour.' Smiths also are able to cure diseases, to give counsel and to make predictions; yet their dexterities lack any magical character; they are only clever men who know a great deal, and whose fingers are expert. Smiths, especially in the north, generally transmit the craft from father to son. In the ninth generation a smith obtains almost supernatural qualities; and the more of a man's ancestors were smiths, the more real these qualities are. In the legends, mention is often made of smiths; they are called an honoured band. Spirits are, above all, afraid of the clink of iron and of the roar of the bellows in activity. In the Kolymsk Ulus, a shaman was not willing to perform until the author should take out from the hut his box of instruments, and after the shaman had failed, he explained to the bystanders that the spirits are afraid of the smith (the author), and therefore will not come at the call. Only in the ninth generation can a smith without danger for himself forge the iron ornaments of the shaman's professional dress and drum, or the brazen breastplate with the figure of a man, which represents the tutelary spirit of the shaman and is put on when he is about to perform. The saying is: 'If a smith who has forged the decorations of a shaman has not enough of the qualities of his own smith-ancestors, if the sound of their hammers and the flash of their fires do not surround him on every side, then birds with crooked claws and beaks will tear his heart.' Amongst such venerated hereditary smiths, the tools have acquired souls, so that they can give out sounds of themselves."³³

The Buryats of Siberia believe there are two kinds of smiths: white smiths who cure disease and protect and are of heavenly origin; and black smiths who are evil—as the color black usually is. If the latter makes a model of a man out of iron and strikes it with his hammer, the man whom the model represents shortly dies.³⁴ Among the hill tribes of Central India the iron-founder is supposed to be a sacred or uncanny person; and the same feeling shows itself in the very common use of iron, copper, or brass to exorcise demons.³⁵ In Burma, food is offered at least once a year to the spirit of Min Magayi, "the mighty blacksmith who watches over every house in the country; and an offering to the same divinity is placed at the top of the first post erected for a monastery."³⁶ Among the Tibetans, the blacksmiths walk in the funeral procession ahead of the corpse, with a drum which they beat during the burning of the body.³⁷ In the Hindu Kush we find a situation more common to Africa: smiths are regarded as natural bondsmen and are sometimes brought for sale to the Mussulmen of the valleys.³⁸

While the blacksmiths in Abyssinia are considered to be were-wolves, the Apache look upon them as being allied to the spirits, and call the smith the witch, spirit, or ghost of the iron.³⁹ In Iceland, blacksmiths were regarded as wild rude men using bars of iron instead of weapons. In the Sagas, no person of esteem is a smith. The smiths live in caves and underground houses like elves and dwarfs, and are clever people existing in loneliness and want, de-

fending their liberty by courage and activity. Often men who are free-born, but of slave mothers, become smiths.⁴⁰

Among the Indo-Europeans of ancient times also the smith possessed fetishistic qualities. "As the amazement of man at the marvellous art of melting the hard metal in the fire and fashioning things of price out of it caused its invention to be ascribed to supernatural beings, so its exercise by mortal beings could not be conceived without the assistance of mysterious and magical means. This view prevailed throughout all Europe. . . . The note of mysticism characteristic of the smith's art appears in the element of treachery and fraud, found in common in the best works of Greek and German smith sagas. This conception has been most characteristically developed by the ancient Germans. "Among them Wieland gradually became the deceitful, treacherous magician, and it was inevitable when the Christian world procured the northern countries the acquaintance of the devil that the priests should eagerly avail themselves of the person of the malevolent smith to illustrate the Christian idea of the Evil One to their heathen flocks. It is beyond all doubt that the old German conceptions of the smith and the devil have many features in common. The devil is the *swarze* master of soot-begrimed hell, he smithies and works like Wieland, above all he is *hinkebein* [lame]. . . . The transference of the art of smithying from divine and supernatural beings to men, and the gradual growth of a special guild of smiths, are best illustrated from Teutonic antiquity. Although, so far as is known, no hero or demi-god is mentioned by name as making his sword or his shield for himself, in classical tradition, yet among the Germans we find numerous heroes of noble birth who know how to work at the smithy for themselves. Wealthy men erected smithies in their forests, the remains of which are still to be traced in Iceland and in the west of Germany by the charcoal and slag. In Ireland too, the most ancient smithies were placed in the most sequestered woods. . . . There were times when the smith, like the gypsies in later years, travelled from one place to another, prepared to set up his workshop at any place. A contrast to this, but one which points equally to the primitive condition of the times, is afforded by the public smithies open to all in the Middle Ages in Germany, where every man did his own bit of work for himself. . . . If the smith is credited with the highest degree of skill possible to man, it is easy to understand that other arts were also ascribed to him. Mention must be made of his skill in medicine, as well as in poetry, music, and the dance. . . . To no idea are the words smith and smithying so often applied as to that of poetry and song, and even in the later Middle Ages poet-smiths are known." Not infrequently, among later Indo-Europeans, the smith was also the physician.⁴¹

Among the Homeric Greeks the smith was apparently a foreigner, and combined inn-keeping with his regular occupation. He appears, in one instance, to have been a retainer. He was respected as other craftsmen were, but, strangely enough, was not included among the "*demioergoi*." "Mention of mortal smiths is rare; from what is said of them, and from the study of the god Hephæstus, no evidence appears to indicate that the smith was regarded as a sorcerer or utter alien. The smith was not confined to the vicinity of ore-deposits, nor were such folk-movements prevalent as would surround him from time to time with a strange population. Hephæstus presents the figure

40 Leo, *Island*, 520.

41 Schrader, *Aryans*, 163, 164, 166, 167; Ratzel, *Vhde.*, II, 542.

of a . . . respected, though not influential god, quite under the maternal domination."⁴²

The occupation of the swordsmith was in old days in Japan the most sacred of crafts. "He worked in priestly garb, and practised Shinto rites of purification while engaged in the making of a good blade. Before his smithy was then suspended the sacred rope of rice-straw . . . which is the oldest symbol of Shinto: none even of his family might enter there, or speak to him; and he ate only of food cooked with holy fire."⁴³ Even today in Japan, "the occupation of a swordsmith is an honourable profession, the members of which are men of gentle blood. In a country where trade is looked upon as degrading, it is strange to find this single exception to the general rule. The traditions of the craft are many and curious. During the most critical moment of the forging of the sword, when the steel edge is being welded into the body of the iron blade, it is a custom which still obtains among old-fashioned armourers to put on the cap and robes worn by the Kugé, or nobles of the Mikado's Court, and, closing the doors of the workshop, to labour in secrecy and freedom from interruption, the half gloom adding to the mystery of the operation. Sometimes, the occasion is even invested with a certain sanctity, a tasselled cord of straw, such as is hung before the shrines of the Kami, or the native gods of Japan, being suspended between two bamboo poles in the forge, which for the nonce is converted into a holy altar."⁴⁴

It is interesting to note that a common occupation of gypsies, especially in Europe, is smithery.

§75. Conditions of Group-Specialization.

THE tribes of Central Australia come from miles around to a place where there is a good deposit, in order to secure stone for making knives.¹ Seligmann² cites many instances of tribal division of labor and a good deal of trade in various parts of Melanesia. The natives of one section of New Guinea have industries divided among the several districts, each with its own. One makes pots, another wooden spoons, others basketwork, still others do wood-cutting, and so forth. The chief trade is in the hands of islanders, who cover great distances and are independent and self-sufficient, even with Europeans. The coast tribes will not allow them, however, to come into direct relations with the people of the interior.³

Stigand⁴ reports an incident from his travels in Africa which throws another light on the relationship. "I produced some calico with which to pay the chief for his services," he writes, "but he waived it aside, dashed into the village, and threw himself head foremost into one of the hovels, and a miserable specimen of a chicken hopped out through one of the many holes in the dwelling. It was finally caught, and the chief ran back and, throwing himself on the ground, presented the anaemic fowl to me. The laws of hospitality demanded that he should first make a present to the stranger before accepting my calico. Very useful does the traveller find this almost universal law as, on

arrival in a new village, he is practically certain of a chicken at least. In many places it may take him a couple of days' bargaining before he can buy another, or he may find it almost impossible to obtain anything else, but the first present is always forthcoming." The ideas of trade of the Atharaka are said to be very one-sided, and the prices they demand for goats, wax, hides, etc., are ludicrous. "The trouble at present is that they are not in want of rupees, so that they can afford to stand by their price or return with their produce. The attempt made to introduce trade, using the rupee as a medium, was in consequence a complete failure; a most lively trade could, however, be carried on in beads and wires with great advantage to the traders. At present the Akamba are exchanging their cast-off beads and ornaments for the Tharaka produce, which the wily Akamba in turn sell to the traders."⁵ Letourneau⁶ has a number of instances of the vague idea of barter found among backward tribes.

There are many additional instances in the New World of the conditions out of which arise group-specialization and trade. As the redwood grows only along the lower Klamath River, the Indians of that section have a monopoly of making canoes; a lively industry has grown up and consequently a good deal of trade with other tribes.⁷ Fabulous stories were told years ago of the abundance and beauty of the pearls found in Florida, Louisiana, and Virginia. They were eagerly sought by barter and by plundering the graves of the natives where they had been buried with the dead.⁸ An extensive trade in salt, taken from the great inland lagoons, was formerly conducted by the Papago, the product finding ready sale at Tubac and Tucson.⁹ The Avavares "bartered bones, which the Mariames ground and used for food;"¹⁰ while pounded salmon flesh formed an important article of trade among the Chinooks.¹¹

Roth¹² gives information additional to that contained in the text on tribal division of labor and barter among the Guiana Indians. He also states that "the Indian knights of the road do not hesitate to puff and advertise their wares to the best advantage on lines similar to those employed by their more civilized brethren. Thus, in the well-established trade and barter carried on between the Saluma and Trio, the former tells the latter that the glass beads which they are selling them grow on bushes which they themselves plant. In Surinam, de Goeje states that when making a purchase the buyer will put some turalla, a vegetable talisman, between his lips to prevent the seller overreaching him." The giving of presents among some of these tribes is somewhat related to barter. If the Uaupes Indians show one hospitality in the way of cassava, smoked fish, etc., they expect something in exchange, and often show themselves very exacting in this respect. "At the Patamona village of Karikaparu the chief's brother upon seeing me walk in lame and weak on arrival gave me a long hardwood stick to help support myself. About a week later, when opening my 'trade,' he saw some knickknack that took his fancy; he asked me for this, reminding me of his previous present to me of the stick."

§76. Trade and War.

SINCE primitive women are often beasts of burden, it may be that their employment in trade developed from their service in carrying goods to market.¹ Women become traders also because of their aptitude in this respect, as seems to have been the case with the Indian tribes of the northwest coast, for "in all the commercial transactions the women took a very principal part, and proved themselves by no means unequal to the task. Nor did it appear that either in these or in any other respects they were inferior to the men; on the contrary, it should rather seem that they are looked up to as the superior sex, for they appeared in general to keep the men in awe and under subjection."² It may also be that women engaged in trade along with their duties for the sake of "pin-money," as is asserted to be the case in Togo, though this sounds quite modern.³ A more pertinent explanation is that in the state of constant intertribal hostility only women could safely trade. In Northeast Africa the women alone do the trading, for they alone enjoy immunity. Among the Somals and Galla, the entire business of trade is in the hands of women who are regarded as neutrals and in a certain respect sacrosanct.⁴ Though markets are held on fixed days in Nubia, there is danger of trouble and lack of security. Unarmed men from each side come together to trade; but the rest, under arms, survey the transactions and are ready to intervene. Ambush by one of the parties often concludes the affair. To avoid all this, among the Masai, the women do the exchanging even in time of war.⁵ We find this custom of using women as intermediaries to prevail in Tartary, in West Africa, in the Kilimanjaro region, among the Tibetans, in Nicaragua, and elsewhere.⁶ Instances of other intermediaries, such as the Jews, who are tabooed or privileged persons and carry goods between hostile or warring tribes, parallel the case of the women and help to explain it. Heyd⁷ states that as early as the ninth century the Jews covered the entire area between France and China as traders and that this had a great effect on the dissemination of culture.

§77. Transitional Forms between War and Trade.

To the classic example of silent barter mentioned by Herodotus, where he describes the traffic of the Carthaginians with certain Africans, may be added several others in Africa and a number among the natives of other countries. An early seventeenth century writer has the following to say with reference to the Gold Coast: "Neere unto those are certaine Negroes, which suffer not themselves to bee seene of any, nor to bee heard speake: but have excellent gold which they exchange with other Negroes, which bring unto them Salt, such as the mineral Salt of Tagazza, and leaving the same, they goe away from thence halfe a dayes journey: the Negroes come downe in certaine Barkes, and lay at every heape of Salt a quantitie of gold, and goe their wayes. When the Salt-Merchants returne, if they like the summe, they take it; if not, they leave the

gold still with the Salt, and goe their wayes: and then the other returne, and what heapes of Salt they finde without gold, they take for their owne: the other, either they leave more gold for, or else leave altogether. This seemeth hard to beleewe, but many of the Arabians and Azanhagi testified it to our Author for truth."¹ Another writer mentions silent barter on the lower Niger, while the same sort of thing prevails on the Loango coast.² In the sixth century A.D., the Abyssinians used this method of trade with the Somals, while the precautions taken at a later date by the Turkish merchants in dealing with the Tcherkesses recall the same transitional state of affairs between war and trade. The merchants did not land, nor did they let the natives on board until hostages had been given. The landing was always made by armed men; the goods were displayed from the distance. It is supposed that the ancient Persians had similar mores.³

An excellent case of silent barter is reported from Sumatra. In the small trade carried on between the Kubus and the Malay traders, the transactions are performed without the one party seeing the other. "The Malay trader, ascending to one of their places of rendezvous, beats a gong in a particular way to give notice of his arrival. On hearing the signal, the Kubus, bringing out what forest produce they may have collected, and depositing it on the ground at this place, hastily retire into close hiding, beating a gong as a signal that all is ready. The trader then slowly and cautiously approaches, lays down on the ground the cloth, knives, and other articles of barter he has brought, to the amount which he considers an equivalent exchange, beats a gong, and in like manner disappears. The Kubus proceed then to examine the barter offered; if they consider the bargain satisfactory they remove the goods, beat their gong and go away; while the trader packs up the produce he finds left lying on the ground. If the bargain is not considered by them sufficiently advantageous, they set on one side a portion of their produce, to reduce it to what they consider the value of the barter offered; and thus the affair see-saws till finally adjusted or abandoned."⁴ Of the Todla of South Celebes, Sarasin⁵ writes: "In earlier times they did not trade directly with the Buginese, but carried on a secret barter. They deposited their wares upon a way traversed by the Buginese, whereupon the passer-by took them and, upon his own estimate of their value, left certain articles in exchange. They did this in order not to be seized and enslaved; now, however, it no longer occurs," that exigency being no longer to fear. The Veddahs of Ceylon got arrow-points from the smith of a more advanced tribe by deposit barter,⁶ while one of the first and greatest Chinese travelers, Fa-hsien, recorded the following concerning Ceylon, which he visited between 399 and 414 A.D.: "This country was not originally inhabited by human beings, but only by devils and dragons, with whom the merchants of the neighbouring countries traded by barter. At the time of the barter the devils did not appear, but set out their valuables with the prices attached. The merchants then gave goods according to the prices marked and took away the goods they wanted. And from the merchants going backwards and forwards and some stopping there, the attractions of the place

became widely known, and people went thither in great numbers, so that it became a great nation."⁷

Trust and mistrust are shown in the trade by deposit among the Indians of the American northwest coast, "The stranger began by depositing his goods on the bank, then withdrew; the Indian afterwards came and placed by the side of the first deposit what he thought a fair exchange and then went away. The stranger then came back and carried off the Indian's goods if they seemed to him of sufficient value; if not, he simply withdrew again, and waited till something else was added. If they did not come to an agreement, each took back his goods."⁸ In Chile there once existed an amelioration of the deposit system. The people on coming to town to trade would warn the chief, who thereupon summoned his subjects with trumpets. The people would take what suited them of the merchandise offered, and then retire into the houses. When the merchants were ready to go, the chief would summon those who took the merchandise and they would bring objects in exchange.⁹ The Indians of New Mexico, in their exchanges with the Spanish soldiers, would plant on the road between Chihuahua and Santa Fé little crosses to which they suspended a leather wallet with a little venison; they then placed at the foot of the cross a buffalo-skin. This signified: "We wish to make exchanges with the worshippers of the cross." The soldiers would take the skin and leave salted meat.¹⁰ Other cases of silent barter have been collected.¹¹

There is further evidence of the warlike origin of trade in various efforts to overreach the alien. In the seventeenth century the Pima Indians sent well-armed bands through the Apache cordon to trade at the Spanish and Mexican settlements of Sonora. Later American traders appeared among them. "Some Pimas sometimes try to turn the tables on the traders by offering damp wheat that of course overweighs. More frequently they put a quantity of sand in the middle of the wheat sacks, which are furnished by the trader and not ordinarily emptied when the wheat is brought in. Rarely, the best wheat is put on top and an inferior quality lies concealed beneath."¹² This quotation emphasizes a phase of primitive trade which is related to hostility, in that strangers are generally regarded as enemies, so that practices are approved in dealing with them which would not have the sanction of the mores if applied to fellow group-members. The Eskimo regard strangers as being outside the law; it is honorable to deceive and steal from them. The Polynesians stole from the Europeans; never among themselves. The Tuareg respect the rights of strangers but little, yet live in the closest union themselves. The Africans are generally suspicious of strangers, who are supposed to have hostile intentions until the opposite is proved. Caravans are stopped at the boundaries and the equipage examined. The Somals and Gallas make the merchant sit down outside the village until a deputation of old men introduce him with ceremony into the village. A case is mentioned of a Carthaginian ship voluntarily wrecking itself on a false route, so as to mislead a Roman ship. This act was highly approved and compensation accorded.¹³ The different mores surrounding inter-

group as contrasted with intra-group relations are evidenced in the Jewish custom of allowing usury with strangers.¹⁴ As the result of suspicion, a curious custom exists among the Bangala. When counting, they use fingers and hands in the usual way; they add and subtract under ten with their fingers, and for larger numbers use palm nuts and the like. "This was not because they were incapable of adding and subtracting mentally, but because they were always so suspicious of each other that they wanted an ocular proof that the sum was right, and that neither was getting the better of the other."¹⁵ Piracy was also closely connected with trade, being found among the Malays, Chinese, Phœnicians, and others, while commerce and conquest have been the policy of nations within more recent times.¹⁶

§78. Exchange in the Industrial Organization.

TRADE has operated in many places and at different times to supplant conditions of war with those of peace, and accordingly has led to the advancement of civilization. Hagen¹ says of the Papuans of New Guinea that in ages past they have traded only when absolute need broke up their laziness. Certain festival market-days were established in rotation, and then the step to the fabrication of rough wares was not difficult and presently there were centers of manufacture of various products such as boats, clay vessels, and smoked fish. Some Papuans are even regular tradesmen who buy to sell, going about to all the markets; these are mainly islanders, some of whom go to considerable distances, and they are jealous of infringement upon their "beats." The people of Bilibili even have special traders who know the languages of various districts; in fact, these islanders, among them, understand and speak all the many languages of New Guinea. Trade is mainly along the coasts, for the coast-peoples will not permit penetration of the interior, they themselves wishing to act as middlemen. The custom of trade-friendship is highly developed; no one man of one tribe can trade with all of another group; each family has trade-friends who are guest-friends while business is being done. Such friends often settle for years in their hosts' villages. Sons of chiefs go on trading-voyages for purposes of education. Such sojourners may marry and remain; thus the loose organization of the tribes is strengthened and the barriers of a multitude of languages are done away with. "Speech and trade are the chief factors which determine the 'external relations' . . . and regulate them, and only so far as these reach does the Papuan state exercise its influence." It cannot extend very far, according to our criteria, because the population is so sparse. They have few needs and trade is chiefly in food-products and "ethnographic articles." Naturally the exchange is no more than barter. "The Papuan trades and goes to market only to satisfy his personal needs."

Competent judges have declared that trade was the first step toward civilization among the negroes of the west African coast, in spite of the missionaries and philanthropists. The tribes in the interior of Africa have been kept from European civilization by the people of the coast, who interpose themselves as middlemen. The market, among the trading negroes, is the center of all active

life, and "attempts to civilize them succeed best by seizing upon this peculiarity."² Markets are especially common in Kabylie, where they are public property belonging to one or more tribes. The intertribal markets are founded with the consent of tribes in time of peace; each tribe establishes such as it wishes in time of war. Custom makes of their markets a neutral place, under a taboo—*anaia* or protection. Everybody who goes to market is inviolable as long as he does not leave the territory of the tribe to which the market belongs. People of hostile tribes, even in time of war, may meet with impunity at the market. In time of peace the market is a place having something of sanctity; every misdemeanor committed there acquires exceptional gravity and is severely punished. Theft on the market is a capital offense; the thief is likely to be stoned to death on the spot; at the very least he is stripped, his beard and eyebrows are shaved, and he is expelled under a shower of stones.³ The Bataks of Sumatra come to their markets with green branches as a sign of peace, and on these occasions all hostility ceases.⁴ A similar stress toward peace is present in those instances of peaceful access, as when, among the natives of Victoria, strangers coming to the quarries are treated not as enemies but as guests,⁵ while among the American Indians, tribes meeting their enemies at the quarries were obliged to treat them as friends, under an injunction of the Great Spirit.⁶

The civilizing influence of trade is seen in the development of a trade-language. One such jargon in America—the Mobillian—was based upon Choctaw, but borrowed also from all the neighboring dialects and even from the more northern Algonquian languages. It was spoken and understood among all the tribes of the Gulf states, probably as far west as Matagorda bay and northward along both banks of the Mississippi to the Algonquin frontier about the entrance of the Ohio. "It was called Mobilienne by the French, from Mobile, the great trading center of the Gulf region. Along the Mississippi it was sometimes known also as the Chickasaw trade language, the Chickasaw being a dialect of the Choctaw language proper. Jeffreys, in 1761, compares this jargon in its uses to the lingua franca of the Levant, and it was evidently by the aid of this intertribal medium that De Soto's interpreter from Tampa Bay could converse with all the tribes they met until they reached the Mississippi. . . . The Mobillian trade jargon was not unique of its kind. In America, as in other parts of the world, the common necessities of intercommunication have resulted in the formation of several such mongrel dialects, prevailing sometimes over wide areas. In some cases, also, the language of a predominant tribe serves as the common medium for all the tribes of a particular region. In South America we find the *lingua geral*, based upon the Tupi language, understood for everyday purposes by all the tribes of the immense central region from Guiana to Paraguay, including almost the whole Amazon basin. On the northwest coast we find the well-known 'Chinook jargon,' which takes its name from a small tribe formerly residing at the mouth of the Columbia, in common use among all the tribes from California far up into Alaska, and eastward to the great divide of the Rocky Mountains. In the southwest the Navaho-Apache language is understood by nearly all the Indians of Arizona

and New Mexico, while on the plains the Sioux language in the north and the Comanche in the south hold about the same position. In addition to these we have also the noted 'sign language,' a gesture system used and perfectly understood as a fluent means of communication among all the hunting tribes of the plains from the Saskatchewan to the Rio Grande."⁷

While the development of the mechanism of exchange will be discussed below, mention might be made here of a primitive device of accounting: "Various bunches of sticks may be seen over any front door of a chief of a household. When a trade is made and partial payment accepted, a stick four or five inches long is taken and notches cut into it to represent the quantities of what is proffered in payment. The stick is then cut or split in two pieces. Each of the two parties to the trade takes a stick. When they again meet for settlement, these sticks must match to complete the notches which were made in the stick of which they are a part. Any tampering with either half of the stick is thus easily discovered. Sticks have different kinds of notches cut into them, some to represent cloth, some tobacco and other articles."⁸ A similar practice was in vogue during the Middle Ages, and it is likely that the word "stock" originally had this significance.

The effect of trade on primitive society may be indicated by the case of the Omaha. "With the coming of the trader and the introduction of iron implements and other articles for daily use, new conditions confronted the Indians; they were no longer obliged to make all the articles required for use and the time formerly occupied by the long and wearisome process of chipping and rubbing stone was now left free." The iron implements were acquired by bartering pelts. Barter was not new to the Indians, but up to the time of the coming of the white trader no Omaha had slain animals merely for commercial purposes. Trade thus gave rise to hunting for gain. "The quest of game for profit introduced new motives for hunting and also of cultivating the soil, motives not consonant with the old religious ideas and customs; consequently under their influence such customs slowly but inevitably fell into disuse." This tended to weaken the power of ancient beliefs and to introduce new standards, commercial in character. The stimulation of hunting as an avocation weakened the influence of the old village life, created different standards of wealth, enhanced the importance of the hunter, and greatly increased the labors of the women in preparing pelts and skins for the market. "There is good reason to ascribe to the last-named condition an impetus to the practice of polygamy among the Omaha."⁹

It is difficult to pass over, in considering trade, so remarkable an adjustment as money; but this topic has been treated with considerable fullness by one of the authors¹⁰ and we refer to that treatment without seeking to reproduce it here. The same may be said of weights and measures; and here we refer to the excellent volume of Ridgeway, who likewise considers the evolution of coinage. It is hard to realize the opposition which this author met in the endeavor to treat such subjects by the inductive method.¹¹

"In 1892 I published my *Origin of Metallic Currency and Weight Standards*, in which I fully developed the anthropological method of dealing with the

problem of the origin of weights of coinage and coin types. I had already converted some political economists and a few classical scholars, but on the appearance of my book the conversion of the historians of trade and money was completed, and ever since, both in Germany and in this country, the soundness of the method has been recognised by scientific students of history. Yet there are still some Greek numismatists . . . [who are not persuaded]. Still less will they believe that the tunny fish was ever a unit of barter or account in those towns, as the dried cod-fish, still the badge of Iceland, was and is still the unit of exchange in that island, and as the beaver, still seen on certain coins and stamps of Canada, represents the beaver whose skin formed, down to our time, the unit of account throughout all the Hudson Bay Company's territory. Nor will they believe that when gold or silver coins were struck there was any relation between the old barter unit and the new silver, although we know from good ancient authority that when Solon struck the first silver drachm at Athens, he equated his new drachm to the sheep and the goat, the old units of account. These, down to his day, had continued, along with the cow, to be the unit of account in the laws of Draco, the old Athenian legislator. It will thus be seen how difficult it is to get the old school of archaeologists weaned from their love of a *priori* speculation and to yield obedience to the inductive method of anthropology, and at the same time to the voice of history. Some of the old school, however, have long since modified their position, and whilst abusing the author have not scrupled to adopt his ideas."

The author goes on to consider the reasons for the opposition he encountered. "What was the cause of this repugnance to a new theory based on a wide induction? The fact is that classical scholars and archaeologists in this country were entirely given up to a *priori* methods, which gave every scope for the play of wild speculation untrammelled by any restraint of solid facts. They proposed emendations in sound texts without ever dreaming of inspecting a single manuscript of the author whose sentiments they proposed to correct. They slavishly followed their German brethren and had settled down, as already said, into a comfortable conviction that not only the culture and art of Greece and Rome stood on a different platform from all other studies, but that it might be pursued with a looseness of method which was banned in all scientific inquiries. They further held that this culture was in the main derived from the East and Egypt, *lux ex Oriente* being their leading axiom. It was a matter of faith that the Greeks had no weight standards nor any means of weighing gold or silver, and did not employ weight in any form until they borrowed weights and weight systems from Babylonia. . . . The orthodox school of archaeologists, when I began to write, held that all weight standards that were used in the world, no matter where found, from Ireland to China, were derived from Babylonia. . . . The talent was supposed to be the first weight unit fixed. Yet investigation shows that all over the world, wherever men have discovered gold and use it, they quickly weigh it with the seeds of plants, which nature has placed as weights of great accuracy ready to hand. Thus the Incas of Peru had scales, and used seeds for weights. The West Africans used the Tacoo or Crab's eye, and the Damba, for weighing gold dust, long before any European had traded with them. The Assyrians themselves used a grain as their lowest unit, which I have shown from its weight to be a wheat grain. The wild tribes of Laos use grains of rice to weigh the gold dust from their streams, and as they value each little hoe which forms their

lowest unit in a system of barter, which ranges from the hoe to the buffalo as the regular higher unit, and to the slave as the occasional higher unit, they have no difficulty in appraising in gold the value of any one of their commodities, whether slave, buffalo, earthenware jar, or piece of cloth. . . . So far, then from the Greeks starting with the Babylonian heavy talent as their unit, they had as their smallest weight (on no less authority than that of Theophrastus) the barley corn. In other words, they were just in the same position as ourselves, for our own troy grain, as I have shown, is only the barley corn. . . . By the statute of Henry VII it was enacted that all the weights of the kingdom should be based on the penny sterling, and that 'the penny sterling or pennyweight should be of the weight of thirty-two grains of wheat, dry and taken out of the midst of the ear of wheat after the ancient laws of the realm.' This statute was really but a re-enactment of laws in use since Anglo-Saxon times. Now an experiment showed me that four grains of wheat regularly equal three grains of barley, and as I found in an ancient Roman metrology that four grains of wheat equal three grains of barley, and as four to three is the relation between the wheat grains of Henry VII and the troy grain introduced from France, there can be no doubt that the troy grain is the barley corn, which we know was used as well as the wheat grain in certain districts of the Roman empire, as well as in Greece."

§80. Primitive Improvidence and Thrift.

SAVAGES very commonly take no thought for the morrow; "when chance brings them a hearty meal, they lie down to digest it and do not stir till they are goaded out of their laziness by the return of hunger."¹ When times are favorable, the Australian black fellow is as light-hearted as possible. "He has not the slightest thought of, or care for, what the morrow may have in store, and lives entirely in the present."² So impatient is the Papuan that he will not wait until the betel-nuts are ripe, but eats them green.³ It is stated of a group of Melanesians that the pump-drill for making holes was constructed whenever the need arose and then carelessly thrown aside, though it could be used not only for wood but for shell as well.⁴

The African Bushman has been referred to as the unfortunate child of the moment. He is destructive and careless, because he is governed in any decision or action by the impulse of the moment.⁵ Foresight is not characteristic of the Akamba, who will not cultivate anything beyond what is required for their immediate use; "despite the frequency of famines no Mkamba thinks of ever sowing more than is necessary to carry him on to the next rains."⁶ Stigand⁷ makes the following interesting comment on the African: "The improvidence of the savage is wonderful. He is an optimist of the highest order. Never does he learn by experience. Cheerfully will he eat all his remaining food, perhaps sharing it with others, quite oblivious of the fact that there are several days' journey in front of him and no possibility of obtaining more

7 *Elephant*, 207-208.

until the journey's end. His sharing his food is not real generosity; he sees that he has got enough and to spare for the meal, and never thinks of the morrow. It is too much trouble to tell the others to go away, so he just lets them eat with him. On a trek in North Eastern Rhodesia, I watched my porters, day after day, cutting the strips of bark with which their loads were tied up, to save the trouble of unknitting them. This happened nearly every day for a month; on arrival in camp they whipped out a knife and cut the last strips. Every morning they had to sally forth and cut and prepare new strips before we could proceed. They never learnt any better, not even at the end of the trek; they are probably still doing it."

Certain natives of Borneo are very improvident; "when they have rice they hold a succession of feasts until it is finished." Garrett,⁸ who reports this, continues: "When I was there the daughter of the Patinggi (head of the village) had just been married. A great feast had been held and everything eaten up, with the result that the men had to go into the jungle to get rotan and rubber, with which to buy rice, without any food: even the children had had nothing to eat the day I met them." The Hindu who has enough for the day is contented and will work no more; this is one reason for the dead level of poverty in India.⁹

The Greenlander is characterized by "a lightminded carefreeness which brings it about that he is inclined to live only a life for the day, to satisfy the moment's wants, without the least thought for the future. 'When the day comes, counsel will come.' He lives according to that rule, swells about and starves in constant succession. With so generous a hand does nature at certain times of the year distribute her gifts that it should be quite easy for the majority to provide for themselves a not inconsiderable winter-supply, but only the wiser provide themselves with enough to meet about half the winter's needs."¹⁰ The Tlinkit lives for the present; "if given his choice whether to accept five dollars at once or fifty dollars a year hence, although reasonably certain that he could have the fifty dollars, he would accept the five, and be done with it. The NOW appeals to him. . . . A white man thinks twice before he throws up his job. Not so with the Thlinget. His desires, more than his needs, control him."¹¹ With the Indians of British Guiana, "the need of the moment demands satisfaction, the next hour lying beyond their mental reckoning";¹² while the Arawaks lack foresight because they lack incentive to labor. Three or four months' work suffices to maintain one of these Indians a whole year; the rest of the time he spends in hunting, fishing, visiting, drinking, and dancing. "His life is a life of indulgence, and only with reluctance will he renounce the pleasures of the present to bestir himself for the future."¹³ With such instances as these in mind, one readily realizes that the development of foresight is prerequisite to the advancement of civilization.

The picture of primitive thrift cannot be so amply illustrated. A rudimentary type of foresight practised by the West Australians is to re-insert the head of a wild yam, so as to be sure of a future crop; but beyond this they do absolutely nothing which may be regarded as a tentative in the direction of cultivating plants for their use.¹⁴ The provident father in New Britain

plants some coconut trees when his son is born; in seven or eight years they support the boy, who, as soon as he can do anything, has a grove of his own.¹⁵ Thrift among the Somals takes the form of capital in livestock; the only poor persons are the cripples and outcasts.¹⁶ The Akus of Sierra Leone are thrifty and industrious, "extremely parsimonious and consequently wealthy," and are making great advances in civilization; while the Kru are hard-working, intelligent men whose great ambition is to save money and return to their native country, there to enjoy a plurality of wives and live at ease without labor.¹⁷

More numerous examples of thrift are found among the American Indians, especially those practising agriculture. All the tribes east of the Mississippi were more or less agricultural, which is in itself an evidence of foresight, while the storing of food was common; to the natives' provision for the future, indeed, the white colonists in a number of instances owed their preservation from famine.¹⁸ The "instinct" of frugality was strong enough to assert itself now and then among the wild-rice gatherers of the Upper Lakes. The Winnebago women contrived to save, by hiding, some of their food in time of abundance; they often buried rice and maize in the ground to keep them from being stolen, while throughout Wisconsin the grain was deposited in the ground to be taken out when needed for food. The Minnesota Indians gathered sufficient wild rice for winter consumption and in some instances saved the grain for an entire year.¹⁹ The Indians of the Southwest practised a rude sort of forest-conservation, for while they had the whole forest to work on, they very seldom, if ever, entirely girdled the yellow pine tree, but always left sufficient bark to keep it alive. The Indians removed the dry outer bark of the trees by means of stone hatchets, after which they found it easy to strip off the inner bark which, when dried and pounded, was used as a substitute breadstuff to eke out the scanty supply of corn raised in the little valleys.²⁰ The many uses to which the Salish tribes put the cedar tree are evidence at once of foresight and of adaptability. The cedar was to the Indian what the coconut-palm was to the South Sea Islander. "From its outer bark he constructed ropes and lines, coverings for his dwelling, his slow matches, or 'travelling fire,' and many other things. From its inner bark his wife wove garments for herself and children, made their beds and pillows, padded her children's cradles, and fashioned the compressing bands and pads for deforming their heads, and also the insignia of their secret societies, their headdresses and other ceremonial decorations, besides applying it in a multitude of other ways. From its wood he built the family and communal dwellings, made such furniture as he used—tubs, pots, kettles, bowls, dishes, and platters,—fashioned his graceful and buoyant fishing and war canoes, his coffin, his treasure chests, his ceremonial masks, his heraldic emblems, his commemorative columns, his totem poles, and a host of other objects. From its branches he made his most enduring withes and ties, and from its split roots his wife constructed the beautiful basketry of this region. There was practically no part of this remarkable tree which he did not apply to some useful purpose or other. He even resorted to it for food in times of scarcity and famine: his wives and daughters robbing the squirrels and chipmunks of their stores of its cones for the nutriment they contained.

One can hardly imagine what the condition of the natives of this region would have been without this tree, no other of the country lending itself to such a variety of useful purposes."²¹ The Indians of the Northwest Coast have a keen appreciation of the value of money, work for wages, and have considerable business judgment. "It would seem that with their ideas of acquiring wealth, we have little to teach them in habits of thrift."²²

§81. Motives to Accumulation.

Even when they have fertile land and good agriculture, natives are found suffering from hunger, as on the African west coast, because they have remained otherwise on a lower stage and lay up no store of provisions.¹ By contrast there appear manifestations of foresight, like that of the Banar of Farther India, who lay up their seed-supply immediately from the first of the harvest, and keep it sacred, believing that the spirits will punish them with death for selling any of it.² Here appears the sanction of religion upon the mores. A striking instance of capital-formation is the planting of a tree or trees at the birth of a child, to be his future capital.³ Pliny⁴ says the branches of the cypress tree were so valuable for use as poles and props that it was once a saying among the Romans that a cypress-wood was a dowry for a daughter.

Cases illustrative of non-inheritance are numerous. Of the Andamanese it is stated that since all their possessions consist of goods that have to be replaced, there is no accumulation of the labors of former generations. They are not tied by any law of inheritance; as a matter of sentiment the nearest of kin takes charge of all the effects left by a deceased person, and often they are distributed among those who seem in need of them. Part of them become a sort of common property.⁵ Codrington⁶ reports from Florida Island that "when they hang up the dead man's arms on his house, they make great lamentations, all remains afterwards untouched, the house goes to ruin." In the region of the Nyanzas, if a chief dies the whole village is abandoned; among the Unyamwesi the oxen of a dead chief are consumed in monthly feasts on his grave, often until all are gone.⁷ At Quillengues, West Africa, "at the feasts of the dead there is an enormous slaughter of cattle, for the heir feels the necessity of killing the whole flock to regale the populace and content the soul of the departed."⁸ Of the Pimas of Arizona it is reported that "the custom of destroying all the property of the husband when he dies impoverishes the widow and children and prevents increase of stock."⁹ Among the Copper River natives of Alaska, the wives and children are always left in destitute circumstances at the husband's death, however wealthy he may have been. This arises from the habit of distributing among the tribe at his death the property, the accumulation of which seems to be a matter of great pride, because the demonstration at the obsequies is in proportion to the deceased's wealth. Here is a case involving posthumous ostentation.

Vanity plays its salient rôle in furthering wastefulness as well as in pro-

moting accumulations. "Every family incident in a Hindu household is attended with ceremonies—ceremonies at puberty, ceremonies at birth, ceremonies at marriage, and ceremonies at funerals. In fact, the life of a Hindu is emphatically one of ceremonies. Savings of ages, hoarded by dint of thrift and frugality, are dissipated in a day or in a few days to meet the expenses concomitant to some ceremonial that is proposed to be performed."¹⁰ Among the Northwest Indians, "the self-denial of comforts and even necessities exercised for many years in the accumulation of property by man and wife is very remarkable, but, in their estimation, is amply repaid on the occasion of a distribution of the same and the erection of a decorative column, which in many instances stands in front of an unfinished lodge frame as a visible monument of the owner's folly and extravagance. . . . The owner probably lives in the lodge of some relative, or perhaps is dead. It has been beyond his means to finish his house, but for that he cares little; his vanity has been gratified; his pride satisfied. On the day when he stood presiding over his pile of goods and chattels, previous to their distribution amongst his eager and expectant guests, he had reached the summit of his ambition. . . . He is thenceforth a petty chief of the village."¹¹

§88. The "Taming of Fire."

WHEN we encounter the natural inquiry as to the source in nature from which fire was derived, we are thrown back on inference. Legends and survivals may lend support to this or that theory but they are not conclusive in themselves. Certain theories are inherently improbable, for instance, those that assign the derivation of fire to what must have been rare and incidental occurrences, such as the rubbing together of bamboo-stems in a high wind.¹ What one acute and experienced observer² of primitive life says of this theory is pertinent to much which we shall encounter later on. He rejects it with contempt remarking that, while incidents have often instructed men, to do that they must be such as occur repeatedly and do not demand any effort at analysis. Those in which he can participate, thereby acquiring a process leading to an end in view, or a method, are the ones that have instructed him. The primitive man is strictly practical; he is not a philosopher or an inventor. What has lent a spurious significance to the above friction-theory is the fact that man's earliest known process of generating fire was by friction. The source of fire must have been in some frequently repeated and very widespread natural phenomenon.

Among origins may be reckoned volcanic activity. It is to be understood that the savage did not dally about for scientific research in the vicinity of an erupting crater, for to him the frightful sights and sounds, formidable enough in themselves, were manifestations of the supernatural, and were thus fraught with a special terror. If the eruption-period were the only time during which he could have appropriated fire from volcanoes, we could rule out this source forthwith. But the cooling lava-streams, with their crevices reaching down to the red-hot strata of the underflow, might well have given early man a chance to experiment with the lighting of dry sticks. However, it will be noted that this source of fire is not one universally available.

The derivation of fire from electric storms seems to us the most simple and

¹⁰ Husain, in JASB, III, 140.

¹¹ Niblack, in USNM, 1888, 308.

¹ Mason, *Invention*, 87.

² Von den Steinen, *Zent. Bras.*, 222.

reasonable theory. Doubtless the savage felt the same terror in the vicinity of electric discharges that he did in the presence of volcanic disturbances, although the relative frequency of the storm would have enlisted the element of familiarity to reduce his fear. But a fire started by lightning might smolder on for days and months, no longer attended by terrifying outbursts of natural force. Prairie and forest fires and the smoldering of punk and peat are observable occurrences. Here would be a chance for observation and experiment. Further, the wide prevalence of electric storms, especially in the warmer zones—two hundred per annum in Togoland, West Africa, and over one hundred and fifty in Java, as against twelve in New England³—in which man must have taken his immediate origin, would allow of the independent appropriation of fire in a number of widely separated localities. The extraordinary extension of the use of fire over both space and time is more readily explained upon this latter hypothesis than by any other single theory. Doubtless it was attained in some localities in an exceptional way, or in several ways; but the thunderstorm looks to be the chief source of derivation.

Local evidence sometimes hints at the volcanic or the electric origin. The Andamanese cannot produce fire, and there is no tradition that their ancestors could do so; but, as they live near two islands, one of which contains an extinct and the other an active volcano, it is reasonable to suppose that their acquaintance with fire was first made through these sources.⁴ Again, "the Golas of West Africa put out all the fires in a village when lightning ignites any substance and immediately kindle new fires therefrom,"⁵—as if utilizing a fresh supply from a stock source.

When one comes to the interpretation of fire-myths, he enters upon still more difficult and insecure ground. The Caroline Islanders have a legend of an evil spirit, a sort of Prometheus, who was thrown from the sky for rudeness, but who brought fire, till then unknown, to men.⁶ Not only among the Melanesians but among the Polynesians as well, occur fire-myths which represent fire as brought to earth against the will of the gods.⁷ "The early vacillation of the myth between the heavenly and the earthly divinity," writes Lippert,⁸ discussing the mythical sources from which fire was derived or stolen, "reflects quite significantly the two possibilities of fire-derivation. Hesiod and those who followed him made the Titan pilfer the fire of heaven from the lightning-hurling Zeus, but Æschylus has Prometheus kindle a narthex-stalk at the volcano Mosychlos on the island of Lemnos, and thus purloin the fire from Hephæstus." Fire-myths, where they deal with the first derivation of the element, always very significantly refer to the bringing of the first fire from some place or direction; we learn little or nothing in the way of direct evidence as to its original appropriation out of nature. Rather do the myths refer to a second stage, where fire was "kept" and carried. A few examples of such myths follow.

There is a legend among the Boloki people of the Congo that they bought their first fire from another tribe in exchange for a young woman. Previously they cooked their food in the sun, or ate it quite raw.⁹ If one believes their own statements, the Batetela were ignorant of the art of producing fire before they

came to their new home. The Sungu maintain that they learned it from the Basongo Meno; the Olemba to this day import their fire-sticks from the Bahamba. Both tribes aver that in former times perpetual fires were kept in all the villages.¹⁰ The Hausa believe that long, long ago an old female devil brought sticks to a certain town in order to sell them, but, as the people there had no use for them, they naturally would not buy them. "The old devil then rubbed two sticks together, and, having lighted them, made a fire, and warmed herself, and, on seeing this, the people bought her stock readily and learned the use of fire. The original fire was never allowed to go out, and many people in Hausaland still preserve the ancient flame."¹¹ The Semas of India have a tradition of a time when fire was not known, and believe that men then had long hair like apes to keep out the cold; but investigation has failed to disclose any notion as to how fire was discovered.¹² In some parts of India the remarkable idea is prevalent that fire is produced from water. In the Veda, fire is called "son of the waters," and this name is also once applied to the sun. "Doubtless the idea arose from the apparent production of lightning from rain-clouds."¹³ A myth which has some bearing on the appropriation of fire out of nature is common to the Samoans, who say there once was a time when their ancestors ate everything raw, but that later a fire-bringer secured it from the earthquake god who had fire always burning in his subterranean region. On De Peyster's Island they say that fire was discovered by seeing smoke rise from the friction of two crossed branches of a tree shaken by the wind.¹⁴ How mankind learned to ignite fire is told in a curious and interesting legend common to many of the Polynesians: "The Maori Prometheus, Maui, who was a great practical joker, having extinguished all existing fires, his mother directed the servants to go and ask the goddess Mahuika to give them fire to cook with, but they were all too terrified to obey her. Maui then offered to go himself. His parents warned him not to play any tricks on the old lady, and he promised to be careful. But on reaching the abode of the Goddess of Fire, and obtaining what he asked for, he went aside and extinguished it, and presented himself again. The fire was obtained by the goddess from the root of her nails, which she tore out to obtain it. Maui kept on extinguishing the fire given, and asking for more, till he thoroughly exasperated the Fire Goddess, who, when reduced to her last toe-nail, pulled it out and dashed it on the ground, when everything caught fire. Maui changed himself into a hawk, and flew with rapid flight; but the earth and sea caught fire, and Maui narrowly escaped destruction. The fire was extinguished by the aid of the God of Storms. But before the fire was all lost the Fire Goddess saved some sparks, which she threw into the kaimakako and a few other trees, where they are still cherished. Hence men rub portions of the wood of these trees together when they wish to ignite a fire."¹⁵ One may be permitted to read into this legend the electric storm as the source of derivation; it illustrates also the second stage, the "keeping" of fire.

The preservation of fire and some of the effects of fire on social organization may be illustrated by the following scattered instances. In the D'Entrecasteaux Islands "there is always at least one fire alight in the hamlet from which brands

can be taken by any one to kindle a fire for himself. In travelling, the natives sometimes carry a fire-stick, sometimes put in at a hamlet and get one. Should it be necessary, however, almost any native can kindle a fire with two dry sticks and some shavings."¹⁶ Hagen¹⁷ cites a case in New Guinea where a village lost its fire and had to send to an island to get more, as there was war with neighboring villages. A high price was charged. A rather incredible case of fire-making method is the one reported from central Australia, where the native rubs up some dung, which he places on the back of a shield; then he takes a throw-stick and rubs it backwards and forwards for a few strokes, the dung being said to catch alight almost at once, and being fed with leaves and grass.¹⁸ A symbolic employment of fire is mentioned in the case of the Baganda of Africa. In front of the hut which faces the royal enclosure is a hole in the ground where, every night, fire from the hut is placed and kept burning brightly, even during a rain-storm, until daybreak, when it is removed to the hut again. When the king journeys the fire goes with him, and when he dies it is extinguished. The death of the king is in fact announced to the nation by words meaning "the fire has gone out."¹⁹

Among some of the aborigines of Siberia the common fire is a symbol of the unity of the clan. "The chief owner of the fire," whom they imagine as an old woman, is not only a good spirit who bestows the use of fire on living clansmen, but also an intermediary between the living and the departed ancestors who are the heroes of the clan. By being burned the dead are given to the "owner of the fire," who has the power of choosing some of them to become also "owners" of the clan-fire. "Only a clansman has the right to kindle fire on the hearth of a fellow clansman, or to take fire out of his *Yurta* [tent]. If a man from another clan lights his pipe in the *Yurta*, he must finish smoking it before he goes out. Any infringement of these customary rules will bring misfortune on the clan, and the alien clansman who has brought it about may have to pay a fine in consequence. Each clan has its own firebrand, kept by the eldest of the clan, and only from this firebrand can the fire be made at which the bear meat is cooked at the bear festival. When a clan divides, the eldest of the clan breaks the firebrand in two, giving a half to the eldest of that portion of the clan which is removing. Then only is the clan regarded as formally divided." The same people furnish an illustration of the use of fire in betrothal and in the wedding ceremony. The following is a description of a betrothal: "The bridegroom's father takes a small sword, and, placing it in the hands of the father of the bride, says: 'This sword is a pledge of betrothal; take it and worship. Do thou pray to the goddess of fire.' Then, having received the sword, he worships the fire, saying: 'We have here and now settled to marry our son and daughter; therefore, O thou goddess of fire, hear thou and be witness thereto. Keep this couple from sickness, and watch over them till they grow old.' The bridegroom's father then receives the sword, and worships in like manner." During the marriage ceremony occurs the "sacrifice to the fire," which is strictly observed even by Christian Yakut. The bride approaches the fire from the north, and throwing into it three sticks brought from her own *Yurta*, and a piece of butter, pronounces these words: "I come as mistress to rule the hearth." Then she bows to her father-in-law and mother-

¹⁹ Roscoe, in *JAI*, XXXII, 51-52.

in-law, and the feast begins. Finally, there is the use of fire in the ceremony of "blessing the bride," which takes place before the girl leaves her own *yurta*. During this ceremony a bright fire is burning, before which she must bow. When she reaches the *yurta* of the groom she must bow before his hearth-fire too, and place in it a piece of meat and some butter."²⁰

It is plain that the idea of kinship lay at the basis of a number of forms visualizing societalization. The use of fire and water, or the imparting of them, are actual and symbolical means of intensifying the integration of the kin-group. In 1694 the Delawares said: "We reckon ourselves all one because we drink one water," although they lived some on one side of the river and some on the other.²¹ Among the Chukchi "generally the fire of a strange family is regarded as infectious and as harboring evil spirits. Fear of pollution extends also to all objects belonging to a strange hearth, to the skins of the tent and the sleeping-room, and even to the keepers and worshippers of strange penates. The Chukchi from far inland, who travel but little, when they come to a strange territory, fear to sleep in the open air and to subsist on their own scant food supply. On the other hand, an unknown traveler, coming unexpectedly to a Chukchi camp, can hardly gain admittance to a tent, as the writer himself experienced. . . . Every family is hampered by prohibitions, the most important being the taboo of interchange of fire (even of partly burnt fuel), which causes much inconvenience on the cold and timberless tundra. It is worthy of note that no such taboo is recognized in their relations with neighboring peoples." Nearest male relations form a union pledged to assist one another. "This union is cemented by the community of fire, by consanguinity (which is admitted for the male side), by the identity of the signs painted on the face with the blood of sacrifice, and by hereditary ritual songs."²²

An old Maori method of keeping fire is described by a native in these words: "If I wanted to carry fire when on the march through the bush, I would cut a short piece of the hollow *rata* vine and set fire to one end of it; it would burn away slowly inside, and all I had to do was to stuff up the ends and wrap up the *rata* in moss and it would smoulder away slowly for hours. Thus, when it was time to camp, we could quickly get a fire for warmth and cooking without the trouble of hunting for a dry *kaikomako* and sweating over it with a rubbing-stick."²³ Before the Cheyenne Indians had flint and steel, they used sticks. After cutting them, "the maker held them up to the sun and prayed over them, asking that they might be blessed and might prove useful"; but fire was difficult to produce and so the Indian carried it, using dry buffalo-chip as punk.²⁴ In the tent and in the earth lodge of the Omaha, the fire was always in the center and was the point from which certain lines of etiquette were drawn. "The guest on entering must never pass between his host and the fire. When the guest was seated no one, not even a child, would pass between him and the fire. If by any chance it became necessary to do so, notice was given to the person passed and an apology made. This etiquette applied to the members of the family as well as to guests."²⁵ Among the natives of Guiana, fire has seldom to be lighted afresh, for it is kept constantly burning in every

house, and even on long canoe journeys a large piece of smoldering timber is usually carried. "Even when walking across the savanna an Indian sometimes carries a firebrand. On the Rio Tiquie at the present time the Bará carry with them from stream to stream a box made from a segment of bamboo-reed, with a hole drilled through its base, to allow the air to fan the glowing tinder within, a substance obtained from a certain ant's nest. In this way they are provided with the means of lighting a new fire without much trouble."²⁶

§92. Fire and Religion.

We have encountered only one case where the "vestal fire" is asserted to have had no religious significance, but to have been kept up in the protection of caves purely for the sake of convenience, the flame being "as carefully watched and attended as the celestial fire."¹ The fetishistic quality is usually implicit, even when not explicitly expressed: We are told, for example, that when the king of Sparta went forth on a campaign, he first sacrificed; "then the fire-bearing attendant, taking fire from the altar, leads the way to the borders of the country." After sacrificing again, "he passes the boundaries of the country. Fire from these sacrifices leads the way, never to be extinguished." A priest was chosen for this function, and its religious character was revealed also by the fact that this priest enjoyed general immunities and privileges. The Persians likewise and the Germans carried fire to war; it was commonly used as a summons and as a signal. The Scandinavians, when they went out to get land, took fire with them—whence the custom of taking possession of property in land by the use of fire.²

Paulitschke³ reports a case where it would appear that fire was kept burning for the sake of ostentation or vanity; but he notes that it is an ancient and sacred custom to perform all important transactions of the household by the hearth-fire, and thinks there is fire-worship behind it all. On the Isle of Man each family kept a fire constantly burning, no one daring to be without a thing so important, or to depend on the care of others for it. This looks like unadorned worldly caution; but the account goes on to say that it was believed that inconceivable calamities would ensue if all the fires on the island went out at once.⁴ The religious element generally enters quite clearly. It is succinctly indicated in such a statement as that of Ratzel,⁵ who says that every Herero village has its holy fire, which is the middle point, economically, politically, and in all other respects, of the society. Similar instances appear in numbers in Frazer's encyclopædic work.⁶

The belief that a new fire must on occasions be lighted, in order to escape sickness or other misfortune, is illustrated especially clearly among certain Africans. Among the Wagogo of East Africa, fire is as a rule always kept burning, but in case of sickness the medicine-man causes all fires in the patient's house to be extinguished and the embers to be cast out at the west end of the dwelling; then he lights his own fire. All fires are put out when the rain-doctor comes to operate, and when the medicine-man comes to charm

away wild beasts or infectious diseases.⁷ In British Central Africa, where fire is carried from hut to hut in the form of a smoldering log and blown into flame with the breath, all fires are extinguished after the death of anyone in the village, fresh fire is made outside the dead man's house, and from this fire is taken to every hut.⁸ When the natives of the Upper Congo wanted to make a new fire, as they did under certain conditions, they took a piece of Mopumbu tree for the lower stick and any kind of wood for the upper one. The top stick was not twirled but rubbed up and down the lower stick. This fire was called by a term meaning "newly originated fire," not a fire lighted from another one; fetish-fire was made by this process. "Some people would have their food cooked only by such a fire for fear of witchcraft." Fire was extinguished either by pouring water on it, or by dividing the burning logs; but the "new fire" was never voluntarily allowed to go out; should the rain put it out, either another new fire was made by rubbing the sticks together or it was procured from a healthy person. Under no circumstances would it be taken from one who was being treated by the medicine-man, "for to do so would be to run the risk of catching the sickness from which the patient was suffering." If frequent sickness visited a house or family, the fires were extinguished and a new fire started. "The idea at the root of thus extinguishing all the family fires and starting new ones was to procure a new lease of health by removing the probable cause of their bad health—a polluted fire." These people also have a ceremony of purification by fire, which is performed in the case of persons who have had to do with the preparation of a corpse for burial, those who attend upon a very sick person, and also those to whom the moon is taboo.⁹ Amongst the Nigerian head-hunters, if any tree or house were set on fire by lightning, all the people would at once quench their fires and hasten to the spot with bundles of grass to get new. "To neglect this would show that the person so doing possessed black magic, and did not want to change his fire."¹⁰

The fire-board of the Siberian aborigines is shaped roughly to resemble a human being. "The consecration of a new fire-board to the office of protector of the hearth and herd is accompanied with the sacrificing of a reindeer to The-Master-on-High, the anointing of the fire-board with the sacrificial blood and fat, and the pronouncing of an incantation over it."¹¹ This object is very clearly a fetish. It is a village custom among a group in Indo-China that once a year all the village fires must be extinguished and new fires made. "A man and a woman are chosen, who rub two pieces of wood together in order to get fire by friction. All the other fires in the village are lit from this source."¹² The Cherokee Indians kept a fire-maker in charge at the burial mound and the town-house built upon it, whose duty it was to keep the fire always smoldering. At the annual feast a new fire was kindled from this fire-pit, and all the fire in the different houses was obtained from the fire-maker at the town-house¹³—such fire possessing a religious quality. The American Indians were accustomed at the green-corn dance and other ceremonious occasions to generate a new fire.¹⁴

The close connection between fire and religion may be further illustrated

in a variety of ways. In Fanti-land it is thought that a wizard can make fire whenever and wherever he likes;¹⁵ in Rotuma, fire could always be obtained from the spirit-house.¹⁶ Some diseases are thought by the Mongols in North Siberia to be due to the wrath of fire at the violation of some of the regulations in its honor. Conflagrations have the same origin; it is wrong to vex the divinity by opposing means; let him satisfy and quiet himself.¹⁷ Among the Nagas of India the fire-stick is used less often for lighting fires than for taking omens. "Fire is occasionally almost personified. The village of Seromi was at one time repeatedly burnt down. At last an old man got burnt. It was at once said that now that a victim had been obtained the village would not be burnt for a very long time. This was many years ago, but no serious conflagration has taken place since."¹⁸ The children of a Palaung clan are solemnly taught that they must always treat the fire with respect. "No one should spit into it, nor should dirty water be thrown on it to extinguish it, though clean water may be used. Stale vegetables may be thrown into it, but no rice, unless as a charm. . . . It is considered very wrong to step upon a fireplace even when there is no fire, so no one may toast his toes on a cold day within the four pieces of wood that form the square and keep the sand and ashes in place. There are fire-spirits, but no offering is made to them unless some one living in the house has painful spots at the corner of the mouth or on the lips. . . . It is not necessary to bring fire from an old home to a new one, and the first fire should never be lighted with matches, but with flint and steel or by the friction of wood."¹⁹ Although the ancient fire-worship and sacrificial ritual have almost disappeared among the Brahmans of India, yet at Benares and other strongholds of Brahmanism a certain number who are orthodox still offer daily oblations in a sacred fire which they maintain in their own houses. Among them the sacred fire is regarded as the "brilliant guest" who lives in the midst of the family, the divine mediator who bears the savor of daily offerings toward heaven, the golden link of union between men on earth and the celestial denizens of air and sky.²⁰ One of the oldest and best-known folk-deities of the Chinese pantheon was the kitchen-god or "hearth-prince." He resembles Agni (Ignis) of the Aryan Vedas, god of fire, and is a messenger of heaven.²¹ Among the Maori the sacred fire was the protecting power of the village home. A portion of a bird would be suspended over the sacred fire and afterward buried in the ground, where it would act as a protecting genius of the land; "by its subtle power witchcraft would be warded off and prosperity retained; the life of man was preserved by such means."²²

To the Seri Indians, a very backward tribe, fire is a beast, not a physical phenomenon; and the production of fire is thought to be like animal reproduction.²³ In Mexican hieroglyphics the fire-drill was the symbol of fecundity,²⁴ and in the Nagualistic rites "it was regarded as the primal element and the immediate source of life."²⁵ Among some tribes of Mongols, bride and groom worship fire on their wedding-day.²⁶ Fire is supposed in the Zend-Avesta and the Vedas to be spread everywhere as the cause of life; while a variant of the

Romulus legend represents Romulus as born of a 'spark from the hearth, which was an altar.²⁷

The Buryats do not like to give fire at all;²⁸ the White Russian peasant will not give it to anybody on a holiday—everything belongs to the spirits at the holy time—this going with the belief that it is a great sin to work on Friday.²⁹ In Ireland, on no account would either fire or water—but above all things a coal of fire, even for the kindling of a pipe—be given for love or money out of a house during May Day.³⁰ Where, as in ancient Scandinavia, land was taken possession of by fire, that could not be done by a woman. She might not handle the sacred element, but was allowed to take as much land as she could walk around in a spring day, from sunrise to sunset, leading a two-year old cow or a half-grown steer.³¹ Women must not have to do with the holy things, especially at certain periods of their lives; among some Pacific coast tribes girls at puberty are kept out of the sunlight and away from the fire; it is a disgrace to parents if they see fire or the sun.³²

§96. Artificial Selection.

GALTON's¹ specifications regarding qualities in animals conducive to domestication repay criticism. He states: "1. they should be hardy; 2. they should have an inborn liking for man; 3. they should be comfort-loving; 4. they should be found useful to the savages; 5. they should breed freely; 6. they should be easy to tend." Several of these items are accepted in the text, as corresponding to Darwin's specifications, and need not be discussed.

Consider, however, the statement that the animal suitable for domestication must be hardy, so that it may thrive if neglected. This condition seems to us superfluous. If an animal will not thrive under neglect, how was it getting on before it received any attention at all? The very object of domestication soon comes to be the protection of a plant or animal against the competition existing in nature and which, up to the time of domestication, it had to meet for itself. It would be difficult to imagine an animal that was not hardy at the time of its first domestication.

Galton's second condition is unquestionably well taken if it means a relatively friendly disposition, and the illustrations are convincing. "The young bison will try to dash out its brains against the tree to which it is tied, in terror and hatred of its captors." Instances might be found to contravert any specific example;² but yet there must be recognized, in animals, a variation of disposition as well as corporeal variation, and a selection under nature of such dispositional variations. Otherwise we could not explain the craftiness of the fox, the blind fury of the rhinoceros, or the industry of the beaver. It can scarcely be believed, however, that any animals really cherished a "fondness for man" prior to domestication. They felt toward him as toward other competitors. The nature of the struggle for existence pursued by the several animals

2 For instance, as regards the bison, see Hornaday, in *Smithson. Rep.*, 1887, pt. II, 454 ff.; "Buffalo" Jones, "The 400 of the Plains," in the *Illustrated American*, Mar. 23, 1895, 374-376.

which were later to be domesticated may have rendered them less savage or timorous than other animals were; but to compare the dog with the ox or sheep, as Galton does, or to ask, after instancing man's power over the dog in consequence of which a smile or a frown may inspire calmness or fear, "Who, for instance, ever succeeded in frowning away a mosquito, or in pacifying an angry wasp by a smile?" seems to us irrelevant. Long ages of domestication and selection have bred into the dog a disposition which cannot justly be compared with that of animals domesticated much later, or not at all. It is the negative quality of less timorousness rather than the positive one of fondness for man which was doubtless often determinative at the beginning.

These qualities are all of a piece: "desire for comfort" means to us nothing more than unconscious recognition of alleviation of the struggle for existence, as assured under domestication. Man surrounds domestic animals and plants with an artificialized environment affording protection against hardships and, in particular, against competition. He plucks out of the garden-bed all such hardy competitors as he is pleased to call "weeds." It seems certain that animals differ in their disposition to take advantage of this easement in living. Bees will use wax provided for them and thus economize on effort to make their own. In general, it would seem that the more highly organized animals tend to fall into this line of less resistance, while lower forms of life submit themselves in few respects to the human régime, however much it would guarantee them of safety and comfort. The matter seems to be one of power of adaptation; if the demands of adjustment to man's presence and control outweigh those of the struggle for existence in the open, the "desire for comfort" does not appear, whereas if the line of least resistance lies in submission, the animal in question may be said to be "comfort-loving." And the comfort-loving ones were not killed off like the recalcitrant, and so had a chance to pass on their complaisant disposition.

It must not be forgotten that during the earlier stages of domestication captivity was enforced, so that the animals had time to adapt themselves to the new order, if they could, just as they would have had time to adjust to some hypothetical necessity of wild life—such as, for example, living in an enclosed valley after falling over a cliff. Hence we regard Galton's second and third conditions as phases of adaptability. And the last condition, that animals should be easy to tend, falls under the same category—the adaptability of the animal to a régime agreeable to man.³

§98. Pastoral Society.

How cattle take hold of the imagination of people and influence the entire societal structure is best illustrated among the Africans. The fruits of the field are never anywhere in Africa beloved to such an extent as cattle. Although the Zulus plant and cultivate grain, their chief business is herding; they ride on cattle and even race with them, make them carry burdens, use the milk as daily food and the meat on great occasions, consider the fat the greatest luxury, also grease themselves with it, and make cloaks, shields, and straps of the hides. The herds are their capital, their pride, and their luxury, while the fields serve their necessities. He who has no cattle is a proletarian, no matter how

³ For examples of primitive methods of taming wild animals, see Lippert, *Kgchite*.

II, 486; Roth, in BAE, XXXVIII, 551, 555; Grinnell, *Cheyenne*, I, 55.

much corn he has, for only by means of cattle can he buy things beyond the first necessity. With cattle alone can he buy a wife or make the sacrifices by which diseases are healed and funerals celebrated. The king is the administrator of the national stock, consisting of these herds, and considers the keeping of cattle as a noble sport; every morning the state of the herds is reported to him and he reviews them. Plundering expeditions are made to get more. The Bechuana, who have done something in the way of developing varieties of cattle, are extremely fond of them, play with them, and ornament them. The men who hate every other kind of work are good herdsmen. The chief is buried in his cattle-yard, and the herd is driven over his grave. Since possession of cattle is the source of power of both Bechuana and Zulu chiefs, the acquisition of herds by the common people, through wages earned among the whites, has tended to lessen their influence. Among the Damara, children form little herds and flocks from the animals given to them by relatives, which property grows as they themselves grow. The family is indissolubly connected with the herd; if a man dies and leaves a widow with infant children, the next powerful man in the relationship inherits the entire family in the Roman sense; he steps into the place of the deceased in every respect. Like the Herero, the Damara live entirely upon cattle, which form the chief topic of conversation; men of the highest rank consider it an honor to tend cattle.¹

Among the Bechuana of South Africa cattle have the nature of totem-animals and form a central point in the religious life of the natives. The cattle-kraal is in close connection with the place of public assembly, where the public business of the tribe is transacted and all the religious rites are held. At the time of a great drought and after all other rituals had failed, there was still another that could be depended upon—a ritual too sacred to be used except in an emergency—the sacrifice of an ox on the grave of a chief. Nor is this the only occasion which needs the sacrifice of an ox; there is an elaborate ritual at the founding of a new town, in preparing an army for battle, in the purification of warriors, and in other ceremonies, in which the ox takes a conspicuous part. The warrior to be purified is smeared by the medicine-man with the contents of the stomach of an ox, into which certain powdered roots have been mixed; and while the thought of such a thing is repulsive to us, the native looks at it in a very different light; indeed, it is a common thing for the men to wash their hands and occasionally their faces with cow-dung, a practice which the recently initiated boys lose no opportunity in imitating, for it is a sign of manhood. The marriage-settlement, which the bridegroom's father hands over to the custody of the bride's family, consists exclusively of cattle, while during the marriage ceremony the sheet of fat that is around the entrails of the ox is rubbed with appropriate "medicine" and laid on the bride's shoulders. At death, the correct thing is to tie up the corpse in an ox-skin. Then, before burial, an ox-bone is held toward the dead man, and then is placed at his head in the grave; a milking-thong, a nose-cord of an ox, and a milk-bowl are shown to the deceased in the same way. After this the peculiar whistle of the herd-boy is imitated, finally some dry cow-dung is thrown into the grave, and the deceased is on his way to the happy herding-grounds. Cattle, in short, take the central place in all the ritual of the greater ceremonies, which Willoughby,² who reports all this, believes can be explained only by assuming that the ritual

¹ Ratzel, *Vhde.*, I, 58, 251, 293, 207, 335, 333; Büttner, *Walfschbai*, 228 ff.

² In JAI, XXXV, 301, 302-303, 303-305, 306, 307, 308, 310-311, 314.

came from a far-distant past when the ox was the totem of the people. If this is so, it is not hard to feel the significance of the Bechuana saying, "The person who has no cattle is nothing at all of a person," or the custom of greeting a chief as "master of cattle" or "one who came forth from cattle." "It is not only that the cattle are the chief wealth of the people, though that counts for much, but it is that they were the clan-god of their fathers."

To a Mkamba, "his greatest pride and joy are his cattle, nothing else has the same value in his eyes; I fear even a wife is a second consideration to these, for after all she is only valued as a portion of the herd." To part with a cow, excepting for the purchase of a wife, is too painful to be considered. Dundas³ continues: "I shall never forget the horror displayed by a native who complained that he was starving, when I suggested that he should slaughter a cow; such a thing is inconceivable to the Mkamba; bulls may on occasion be sacrificed, but cows never; neither will he ever think of selling a cow, even if he is on the verge of starvation. The manner in which a Mkamba regards his cattle is thus more in the light of family heirlooms; they also tell the position of the family and are a record of its past. It is conceivable, then, what a calamity cattle disease is to them. I know an old man whose cattle were dying of disease, and the sight was so heartrending to him that he could not stand it and went to stay elsewhere until the calamity should be past." The chief occupation of the Bahima is herding cattle; "they form warm attachments for the animals, some of them they love like children, pet and talk to them, coax them, and weep over their ailments; should a favourite die their grief is extreme, and cases are not unknown in which men have committed suicide on the loss of a favourite animal." Time of day among these people is reckoned in terms of cattle; for example, 6 A.M. is milking-time, 1 P.M. the time to draw water for cattle. As in so many other instances, women are not permitted to tend the stock.⁴

The Dinka and Bari are as passionate herdsmen as the South Africans. "The possession of cattle is the great ambition, and the tending of them the chief occupation of the Dinka. . . . Nothing confers such prestige and position as the possession of large herds, and the authority of a Beng (Sheik) who loses his cattle is usually impaired." The Dinkas consider milk to be the best of all foods, and drink very largely of it. They also use the urine of cattle for washing themselves, and smear their bodies with the ash of burnt dung. Cattle are currency in any transaction, as for instance the purchase of a wife or the payment of reparation for an injury. "In the absence of money, cattle may be regarded as the 'root of all evil' in the Dinka country. Every raid has for its object the acquisition of stock, and for its justification, the story of some former raid by the enemy upon the intending raiders. Every quarrel and dispute is nearly or remotely traceable to the same origin, and if the proverb *Cherchez la femme* applies, the woman is only reckoned in terms of cattle. . . . If, however, the vices of the Dinkas are derived from their greed of cattle, they owe their virtues also to the same source. With them this passion seems to replace, in some measure, the ideals and aspirations to which the European has recourse as foils to the materialism of life." The Dinka displays reckless gallantry in attempts to rescue or defend his herds, while as a cattle-master he exhibits a gentleness and kindness foreign to him in other respects. "In

³ In JAI, XLIII, 501-502; Hobley, in JAI, XLI, 424.

⁴ Roscoe, in JAI, XXXVII, 94-96, 114, 100.

the tending of cattle he never tires. Such labour is to him a labour of love. To feast his eyes on fat kine, feel their sleek coats, drink of their milk, and adorn himself with the ashes of their dung, no Dinka would ask a happier life. His songs, his stories, his rude modelling in clay, and, in fact, all his progressions in the direction of art, are inspired by his one absorbing interest—cattle.”⁵ High consideration for cattle, though lacking the picturesqueness of the Dinkas, is found among the Masai, Somals, and other tribes of northeast Africa.⁶

The Kirghis of the Russian steppes live entirely by their herds, and this governs all the details of their lives.⁷ The Todas of India have the highest possible regard—amounting almost to reverence—for the cow. The milking and churning operations of the dairy form the basis of the greater part of their religious ritual. “The lives of the people are largely devoted to their buffaloes, and the care of certain of these animals, regarded as more sacred than the rest, is associated with much ceremonial. The sacred animals are attended by men especially set apart who form the Toda priesthood, and the milk of the sacred animals is churned in dairies which may be regarded as the Toda temples and are so regarded by the people themselves. The ordinary operations of the dairy have become a religious ritual and ceremonies of a religious character accompany nearly every important incident in the lives of the buffaloes. . . . At the present time the buffaloes are tended entirely by males, and males only are allowed to take any part either in the work of the dairy or in those dairy operations which are performed in the house.”⁸

The Indo-European was a cattle-breeder; his herds were his wealth, the object for which he fought, and the source of his food and clothing.⁹ In the *Iliad* pastoral nomads are called the most righteous of men.¹⁰ Not only was the value of the full grown cow in gold the Greek standard, but it was also that of the ancient Egyptians, whose oldest gold unit is termed “ox-gold,” and so also was it over all Asia and Europe. “Investigation showed that the value in gold of a full grown cow during a period of one thousand years from India to Ireland only varied from 140 to 120 troy grains of gold. This has for us a peculiar significance since our own gold unit, the sovereign, weighs 120¼ grains. It is really descended from the ancient gold unit based upon the cow, the primitive chief unit amongst all cattle-keeping communities in all periods of the world.”¹¹

§99. The Dog.

As was stated in the text, one must confine himself to generalities respecting the societal effects of animal-fetishism unless he cares to enter into lengthy detail in the effort to exhaust the subject. Such cannot be the object in a general treatise on the science of society.¹ Hence, in conformity with our method of selection of types, we shall seek to indicate the concrete background to a

number of the positions taken, by rehearsing in its salient aspects the history of what was in all probability the first domesticated animal, the dog.

Protracted selection has much transformed this animal once appropriated in the form of several wild species.² Weismann³ distinguishes seven main breeds of dog, with numerous sub-breeds; forty-eight sub-breeds are guardians of the house; thirty have silk-like hair; there are twelve of terriers, thirty-five of sporting-dogs (ranging from the deerhound to the pointer), nineteen of bulldogs, thirty-five of greyhounds, six of naked or hairless dogs. Many of these could not have survived had they existed in nature. The range of the domesticated dog in space and time, which is very great, supports the preceding evidence that he has been long under domestication; for he was unquestionably taken to all corners of the earth by man. His bones are found with those of prehistoric man,⁴ and but few aboriginal peoples have not possessed him. Yet there are a number of cases which reveal the animal but partially tamed.

The Australian dingo would not sleep or take shelter under the roof of his master; in watching he was vigilant and fierce, and would fly at the throats of visitors. He was trained to hunt, which was his principal use.⁵ In Homer⁶ we read of a breed of large, fierce dogs which were like wild beasts and would tear a stranger to pieces; the shepherd himself carried a spear, "a defender from dogs and men," and kept them off a stranger only by stoning them. It is noteworthy that these half-wild animals, in addition to their other wolf-like characteristics, do not bark but howl, thus exhibiting again the marks of their origin; the Indians showed great fear of the Spanish bloodhounds, especially when they bayed.⁷ The wildness of the strain is kept up, in the case of some Indian dogs, by frequent interminglings with wolves.⁸

The treatment which dogs receive tends, in some cases, to keep them in a savage state. The Greenlanders handle their sledge-dogs in barbarous manner, cutting them up with their heavy whips and feeding them poorly; of the East Greenlanders, we read: "In summer, when they have no use for dogs, they leave them on a little desert island, whence one can hear at a very great distance their piercing howls."⁹ Among the Indians they "are worked very hard, have hard blows and hard fare; in fact, they are treated just as this fine animal is treated among the Esquimaux."¹⁰ Contrasts of course occur: the Canoeiros Indian women of Brazil even gave the breast to young dogs, which were often granted preference to children in the matter of food and drink; while the Guiana women suckled dogs and other young mammals as they would their own children.¹¹

Speculation as to how the dog was brought into a status of even semi-domestication is probably fruitless; Lippert's¹² conjecture that he probably followed the hunter to get the refuse of the game, and that thus man became

acquainted with him and cultivated his society, seems as satisfactory as any other.

Utilities of the dog. One eminent anthropologist¹³ considers it "most probable that the dog was long the only domesticated animal"; and he enumerates the uses to which the dog was put as follows: "The Esquimaux forced him to draw the sledge; the Chinook kept him for the sake of his wool; the South Sea Islanders, having no game, bred the dog for food; the Chonos Indians taught him to fish." His utility has run all the way from the slightest to the greatest—to several Arctic peoples his presence is almost a condition of human existence. For a short time, and if the cold is not too intense, the dogs of the Hyperboreans will cover sixty to ninety miles in a day, while those of Kamtchatka will draw three persons and their baggage about twenty-five miles a day on bad roads and over fifty on good ones.¹⁴ What Arctic exploration has owed to the dog is well known.¹⁵ The service of the dog as a draught-animal elsewhere than in the Arctic regions is sometimes overlooked; the gesture for "dog" in the Indian sign-language—two fingers extended and drawn along a surface—indicates the traditional utility of this animal among them.¹⁶

Dog-Eating. The various utilities of the dog do not call for rehearsal; it is to his most primitive and therefore unfamiliar service that a word should be given. It has been stated in the text that the primary incentive to the domestication of both plants and animals lay in the food-interest; animals that have ceased, in some cases altogether, in others locally, to afford food to man, were unquestionably at one time of great importance in just this particular. It is not difficult to believe that early man was practically omnivorous; and ethnographic instances and survivals preserved in the cult unite to support such a conviction. The case of the dog is in point.

The Nicobarese have practised the eating of dog's flesh from remote times.¹⁷ In Korea, dog-flesh is in much demand at certain seasons and dogs are extensively bred for the table;¹⁸ it is no uncommon event in China to see such meat displayed in the market. Among some tribes of northern Peru, dog-flesh passed for the greatest delicacy.¹⁹ Among the Dakotas, "*shun-ka*, or dog, cannot be called a domestic dish; it is only eaten in cases of dire necessity, and is considered too delicate for ordinary consumption. It is usually eaten at a special feast in honor of warriors of renown, to whom, as the highest courtesy, the head is given."²⁰ This and the following cases reveal a special significance, of a magical or religious order, attached to the eating of the dog. Among certain Central Africans dog's flesh is much prized, but women are forbidden to eat it. After such a meal a bath must be taken before returning to the house; and the husband must not touch his wife, even with his finger, for a day thereafter.²¹ Some tribes of Nagas, instead of burying his dog with the deceased, cut up the dog and distribute its flesh to all guests at the funeral

who are not of the same clan as the dead man.²² An ancient Irish hero is represented as having lost power and life because he had eaten of dog's flesh against a Druid's command.²³

In one of the dancing-ceremonies of the Haida, the performer would snatch up the first dog he could find, kill it, and tearing pieces of its flesh, eat them.²⁴ We are plainly told that the Sioux ate "ceremonially" the dogs which they kept for their flesh; and the inference is that dog-eating had become for them a thing of the past retained as a cult-survival.²⁵ In the Sioux sun-dance stewed puppy was eaten together with wild turnips—with which practice may be compared the eating of boiled puppy in ancient Rome, which was done at intervals by the highest civil and ecclesiastical dignitaries.²⁶ In any case the dog was often the animal of sacrifice, from which it may be inferred that he was formerly eaten. One case of sickness is recorded in which three dogs were hung to the door of the house as an offering for recovery.²⁷ One of the most important religious festivals of the Iroquois was the cremation of the white dog, whose soul was employed as a sort of messenger to the Great Spirit. This dog must be healthy, and without blemish, and snow-white. It was strangled in such manner as not to spill any blood nor break any bone, decorated in a certain manner, and hung in the fork of a pole for a certain time prior to the solemn sacrifice.²⁸ "The missionary Kirkland witnessed among the Seneca a ceremony lasting seven days, in which two white dogs were strangled, painted, decorated, and hung up in the center of the village on the evening preceding the beginning of the rites; and after the performances had lasted several days, the dogs were taken down and placed on a pyre, and when nearly consumed one was removed and placed in a kettle with vegetables and eaten. This shows that as late as 1760 the flesh of the victim was ceremonially eaten among the Iroquois."²⁹ This instance falls into line with those of the Apis-bull and the white elephant and opens the topic of the dog as a fetish.

The Dog-Fetish. That the half-wild dogs not infrequently "buried" the dead by devouring their bodies is a fact of ethnography and history. But, under such conditions, the dog was well-started on his fetish career.³⁰ There is also that about the actions of the dog which would have caught the attention of minds saturated with the ghost-theory—all the more so since the dog was, in all probability, the first domestic animal, and so the first beast to which consistent, intimate attention was given. His alertness and ability to scent danger where even the sharpened senses of the savage perceived none; his tendency to growl at or challenge unseen things at night, to "bay the moon"—these were characteristics which led primitive man to assign him a sort of second-sight. And so the belief grew that the dog could see spirits where men could not; and that he did not fear them—for did he not snatch at the leavings of meals, so often sacred to the ghosts, and worry them out of the very clutches of the dread beneficiaries? The spirits, at any rate, were believed to be frightened away by his snarling. Like fire and water,³¹ the dog came thus

to be a protector against the assaults of the unseen world—a restrainer of spirits.

First, as to the power of seeing spirits: Hindu villagers believe that dogs perceive spirits and by their barking or moaning warn their masters while passing at night from one village to another.³² The Nagas believe "the spirits of the dead are not visible to human eyes; but dogs can see them, and if a dog howls or barks when no stranger is near, they believe that the souls of the dead are hovering about."³³ The dog, in Homer, saw spirits when men could not see them, or could see them only with divine aid. When Athena came into the courtyard of Odysseus, only he to whom she revealed herself, and the dogs, saw her; and the dogs did not howl, but whined and fled.³⁴ The Cheyenne Indians believe that dogs are the first to become aware of ghosts.³⁵ According to certain folktales, and, indeed, popular superstition, the nocturnal howling of the dog betokens a visitation of death in or from the indicated direction; that is, the dog sees the approach of the death-dealing spirit.³⁶ According to the Araucanians, "when a dog bayed by night, it was a demon prowling round, on the look-out to occupy somebody whose owner . . . was away, that is dreaming; and those that heard it woke their companions, to avoid such a misfortune."³⁷ Says the dog in the Indian legend: "I will be her dog and see that no disease approaches her. If an invisible spirit approaches, I will bark."³⁸ Moslem tradition urges the believer: "When at night ye hear a dog bark or an ass bray, then flee before Satan to God, for they have seen the invisible."³⁹ They have seen "the invisible": but to the primitive there is but one category to cover all invisible forces—the ghosts and spirits.

Strikingly enough, the dog is found in several cases to be the agency that both protects the ghosts and keeps them from issuing out of the spirit-world. In the New Hebrides the ghost of a dog can scare away the ferocious spirit of the lower world, Sara;⁴⁰ while in the Solomon Islands it is believed that dogs help men against the terrible snake-spirits.⁴¹ The Greenlanders bury a dog's head with a child "so that that wise animal may show the little uninstructed soul the way to the happy land."⁴² Then, again, the watch-dogs of the spirit-world must be considered and given a "sop": twelve cakes are taken by the soul to pacify the twelve dogs of hell.⁴³ At the entrance to the underworld, think some Siberian aborigines, are found dogs as guardians, and "a person who used to beat his dog during his life on earth will be stopped by them, though, in order to propitiate the guardians, he can carry in his mittens the fins of fishes, of which they are very fond." One of these tribes, the Gilyak, believe that besides his principal soul or souls each man has a lesser soul which continues to live for some time in the best-beloved dog of the deceased, which is especially cherished and cared for.⁴⁴ Among the Sema Nagas, "a favourite dog is usually killed when its owner dies. It is killed just as its body is lowered into the grave that its soul may accompany his. In the case of a

man who has killed a tiger, leopard, or bear, such action is necessary, and if he possesses no dog at the time of his death, a dog is bought for the purpose in order that its soul may go with that of the dead man and guard him on his way to the village of the dead from the attacks of the beasts he has killed and whose souls are lying in wait for his."⁴⁵ The way to the world of the dead was thought by the Vedic Indians to be guarded by two dogs.⁴⁶ Among the Dyaks "the narrow road to Elysium is guarded by a ferocious double-headed dog . . . to whom it is necessary to present a valuable bead."⁴⁷ The dog was already the animal of the dead among the Mexican Indians; when the ancient inhabitants of Anahuac burned a corpse they killed a red dog and laid it beside the dead body. They thought that four years after death this dog had to carry the soul over the "ninefold stream" that flows around the innermost hell, the final abode of the dead.⁴⁸ The Tlinkit never took dead bodies through the door, but through a hole made in the side of the house or through the aperture in the roof, and a dog was taken along with the corpse. "If the dog were not taken they believed that some one of the family would surely die, but if the spirit of the deceased entered the dog it would not return to the injury of any member of the household."⁴⁹ In these views we see a strange parallel to the Greek conception of Cerberus who restrains the spirits once across the stream from the possibility of return. Rationalization of such cases leads to the theory that the dog is needed by the soul of the "just" man as a protector in order to make a safe crossing into the spirit-world, just as he is needed by the living man under many sets of circumstances.⁵⁰

The Dog in Religion. The dog keeps off the ghosts from living man and so preserves him. Hence the Persian conviction that it is through the understanding of the dog that the world persists. "When the dog, together with the cock, strive against Darudji—the evil Ahriman-spirit—they take away the strength from him who otherwise would cause pain to men and cattle. And so the saying goes that through him (the dog) are all enemies of the good man overcome. His voice destroys the evil." So valuable an ally in the struggle man must meet receives the best of care; we see "the old cult-significance of the matter in that the care of the dog is set on a par with the guarding of the holy fire."⁵¹ In D'Entrecasteaux there is a myth concerning the acquisition of fire, in which the dog is effective.⁵² The idea is now not so far off that the dog himself, or at least some peculiarly marked animal—a "white dog"—is a spirit. Among the old clans in Manipur eclipses are generally ascribed to the sun and the moon being either caught by, or hiding from, Pathian's dog, which was set on them, because they stole his master's tobacco, or scattered his rice.⁵³ "Among the primitive Guarani heathens [of South America] an eclipse was called *yagua*, meaning dog in their tongue, from their fable that a great dog roamed about among the stars and now and again tried to swallow the sun or moon." One who predicted eclipses was called "friend of the dog."⁵⁴ A war god in a number of Samoan villages is incarnate in a dog—a white one usually. "When he wagged his tail, barked, and dashed ahead in sight of the

troops of the enemy, it was a good sign; but to retreat or howl was a bad omen."⁵⁵ There are some American Indian tales of people being descended from dogs.⁵⁶

In Persia there was a dog-cult. It succumbed to the fire-cult and the religious significance of the dog dropped away, leaving, however, many a survival in custom to explain. The original and evolutionary relation having now lapsed into oblivion, there is developed a rationalization of the facts which not seldom bears but a grotesque likeness to the historical actuality: for example, that the dog is well treated because if he is beaten, the evil deeds of wolves and robbers increase; or, as a still more rationalized version, that the dog is honored because his hide was the first clothing of man.⁵⁷ Similarly in Egypt the dog was a fetish, and was mummified. The god Anubis bore the head of a dog and the Romans called him the Latrator (barking) Anubis; he was the "protector of graves." In Homer,⁵⁸ Scylla is referred to as "barking Scylla"—a sort of personification of threatening calamity. In both Persia and Egypt the religious respect accorded the dog demanded a corresponding treatment and implied a peculiar form of domestication. Later the religious character wears away into symbolism. Homeric royalty was generally attended by white dogs, which were, like the scepter, a sort of symbol of authority.⁵⁹

§102. Slavery and Herding.

In parts of Africa, slave-hunts are chiefly for wives, and a slave is not of himself valuable, unless there is a sufficient demand for labor. In the tales of some of the Siberians there is mention of the capture of numbers of herdsmen along with the herds taken in war. These herdsmen were enslaved, being particularly valuable in that "they knew their own herds better than the victors!" By the Chukchee, "captive women were hard-worked, and were made the wives of their masters. Sometimes they were sold from one camp to another; but, on the whole, their position was little different from that of the Chukchee women."¹ Rockhill² does not believe that slavery exists in the greater part of Tibet, and certainly not among the pastoral tribes, beyond a mild form of domestic serfdom; yet in some of the outlying districts where there is a large non-Tibetan population, regular slavery prevails. The herding nomads of East Africa cannot use slaves, who would merely increase their numbers, and they therefore make war to steal cattle only. Negro herdsmen whose herds have a certain size can feed and use no more slaves and so kill their captives; but others can use slaves and do not kill prisoners. Peoples who have a good market, on account of their connection with the Arabs on the coast, carry on war to win slaves whom they sell, for the most part, to the coast people.³ Here the slave has become a ware in commerce, this carrying us beyond the stages of extractive industry, but illustrating how the development of civilization alters the conditions and form of slavery. These run parallel with the several phases of the industrial organization; thus, the later-developed cotton-

industry and the invention of the gin determined them in America and elsewhere.⁴

A few miscellaneous cases, varying about the normal, may fill in the outlines of pastoral slavery. Among the Bechuanas live a group of Bushmen whose status is not well defined and who seem to receive no remuneration for their service in tending the former's flocks and herds.⁵ "Since the Matabele devote themselves entirely to war, do not carry on any agriculture or handicraft, do not make their own assegais, do not even chop their own wood, they need a number of slaves."⁶ Again, "because there is little scope for slave-labor under the exploitation of female labor-force and in the presence of the pariahs, the slave-trade is but insignificant" among the tribes in the eastern horn of Africa. Suahili slaves are acquired and set to work in the towns, but they are of no use to the nomadic cattle-peoples. We may note, by way of anticipation, that the presence of agriculture has immediate results on slavery. Even among prevaillingly pastoral tribes, to whom slaves are of little use, "there is an exception in the case of tillers . . . who have their farm-land attended to by slaves."⁷ In each district of the herding Bahima are settlements of slaves who are agriculturists; "the chiefs and various clans claim from them servants of both sexes to do their menial work, and men for building the more permanent kraals, and for carrying the baggage from place to place, when they move to new pasturage."⁸ Until the tribes have advanced beyond the strictly pastoral economy there is small utility in slavery. A few examples of the servitude of group to group are found among the negroes, Arabs, and others;⁹ while Justi¹⁰ mentions certain agricultural Scythians who were held as slaves by other Scythians for the sake of having the land cultivated. "The Germans who, according to the description of Cæsar,¹¹ confirmed by Tacitus, concerned themselves little with agriculture but passed their whole lives in the hunt or in warlike exercises, laid the weight of tillage upon the dependent classes."

§104. Slavery as an Adjustment.

SLAVERY prevailed everywhere in Melanesia, says Ratzel,¹ originating either in war or debt; sometimes it was hard, sometimes not. Yet in his book on the Melanesians, Codrington² affirms "there is no such thing as slavery properly so called. In headhunting expeditions prisoners are made for the sake of their heads, to be used when occasion requires, and such persons live with their captors in a condition very different from that of freedom, but they are not taken or maintained for the purpose of slaves." The fact seems to be that slavery is not a developed institution in this region, but exists sporadically in connection with certain religious and even cannibalistic practices. In San Cristoval of the Solomon group, beside children who are bought, there are "real slaves, people guilty of serious offences who are sold away to places at a distance, and people captured in war. Such slaves were kindly treated, but could be killed if a human sacrifice were needed in building a new house,

launching a new canoe, or at the death of a chief."³ Slaves in New Georgia are kept chiefly for their heads, which are taken suddenly and unexpectedly, when occasion calls for them, the victim first being killed by a tomahawk from an ambush. He has no warning, which is merciful. Aside from this hazard, conditions are so mild that it is scarcely possible to distinguish master from man.⁴ In Fiji "there used to be slaves, treated, often eaten, like beasts kept for labor and butcher's meat";⁵ while among the cannibals of New Britain "one may find even to-day [written in 1898] chiefs who keep slaves for the purpose of food, and who are in the habit of killing them every few days to satisfy their diabolical tastes."⁶ Conditions among the eastern blacks are so primitive and the self-maintenance organization so undeveloped that slavery as an institution can hardly be said to exist. When we turn our attention to the western blacks we find a totally different situation.

The Africans have enslaved and been enslaved since time immemorial. Slavery still exists in some sections; Junker⁷ says the negro does not understand new laws like the one to abolish house-slavery. In some respects, as in transportation, slavery is a necessary adjustment. "Africa is covered with a network of roads of a kind—native paths, leading from village to village, formed by the naked feet of many generations of villagers, but only broad enough to admit of a single file. Beasts of burden are of course scarcely possible on such tracks, and as a matter of fact, over the great part of Africa the native himself is the only beast of burden."⁸ In the far interior pack-animals can be employed, but they cannot traverse belts infested by the tsetse fly or survive in the coast regions and were unknown in Uganda and Nyasaland. These conditions favor slavery on the one hand and, on the other, retard the development of commerce.⁹ War also has been an important factor in accounting for African slavery, along with the organized slave trade that was developed under European and Mohammedan influence.

Slavery has helped to keep the Kaffir tribes in perpetual unrest and barbarism by destroying the germs of civilization and preventing its growth.¹⁰ Among the Nama, the Bechuana, and others are found despised groups like the Hill-Damara and Bushmen who are virtually slaves and receive bad treatment; but the real bondsmen are those who have been taken prisoner in war or forced into serfdom through poverty. The Nama women mistreat the slaves, though this is not usual in South Africa, where the women are themselves reckoned among the servants. To treat a slave brutally or even to kill him is not a punishable offense.¹¹ Among the Wachagga there are two kinds of slaves: the house slaves and those of the chief, the first being women and children taken in raids and belonging to the warriors and counselors as their share of the booty, and the others being such natives as have fallen into debt and been sold to the chief as field-workers, or minors who have committed an offense for which their relatives have not paid compensation. Both kinds of slaves, who may not be sold over again, can regain their freedom—the children when they become of age and when they have worked off the value of the goods stolen or de-

stroyed. In all cases, what the slave earns belongs to the master; on the other hand, as he disposes of the property of the master like one of the members of the family, the desire to be free is not very pressing. Children of slaves are the property of the owner.¹² Considerate treatment is accorded the slaves among the Hovas, where they are generally members of the family, though of a somewhat lower rank; "often the master furnishes them a life which many a freeman might envy."¹³

Slavery is very common and even profitable in Central Africa. "There are places in Africa," writes Macdonald,¹⁴ referring especially to the east central section, "where three men cannot be sent on a journey together for fear two of them may combine and sell the third." Slavery makes the Central African much more gloomy than the free man of the South; it adds danger and uncertainty to life. It appears to be economically profitable to buy slaves and put them to work; "they are living money and every man tries to see how much of it he can amass."¹⁵ The economic value of slaves operates to assure them fair treatment: "the head of a village may, under the African law, kill his slave, but only a fool would do so, as he would simply impoverish himself by the value of his chattel in the open market. . . . Domestic slaves have a quasi right to any property they may accumulate while they stay with the masters under whom they gather it; but if sold, the property remains the master's. Most Africans like to see their slaves grow rich. They consider them in a way their own children. . . . A slave's wives and children belong to his master and may be sold at any time. A headman in debt sells first his slaves, then his sisters, then his mother, and lastly his free wives, after which he has nothing left."¹⁶ Slaves, who do much of the agricultural work in Uganda, are well treated as members of the family;¹⁷ while in the case of the Ba-Mbala, "they do not work harder than freemen, are usually provided with wives by their master, can possess property and other slaves, and can purchase their freedom if their estate of slavery is acquired and not congenital." Among the Ba-Yaka, on the other hand, where slaves form about fifty per cent of the total population, they receive very little consideration, are often ill-treated, cannot possess property, and therefore have no chance of redeeming themselves. The Ba-Huana also are harsh in the treatment of their slaves,¹⁸ while the northern Batetela will eat their slaves, "but as no one for whom the slave has worked may partake of the meal, it is usual to buy a slave specially for cannibalistic purposes and to kill him at once before he has worked for his new master."¹⁹ This case is alignable with the exemption of the work-animal from sacrifice. In general, slaves are very well treated among the natives of Central Africa, comments Brunache,²⁰ who adds significantly, "where they have not been contaminated by contact with the whites."

In East Africa the slave generally lived in peace and ease. "In most tribes he could acquire property of his own, and though his master may have a right to such property, this right is rarely made use of. . . . The European will as a rule hardly be able to distinguish the slave from his master, so much do they

live as equals, and ordinarily one would take the slave to be a child, son, or wife of the master. The great distinction here is that the slave may as a rule be sold to another man. On the other hand, the master is as a rule liable for the debts and misdeeds of his slave."²¹ To the northeast, among the Galla and Somal, although there exists an extensive traffic in slaves, the latter are well treated and cannot even be called poor. The power of the owner over his slaves is not absolute; even if the slave commits murder he is not killed but receives corporal punishment or is re-sold. The slaves themselves know that they are kept less for their work than for their children, who are objects of sale. Their masters usually give them patches of ground which they cultivate for themselves; also cattle and occasionally presents.²² Numbers of young natives often voluntarily attach themselves to the Nubians, and are highly delighted to get cotton shirts and guns of their own. "They will gladly surrender themselves to slavery, being attracted also by the hope of finding better food . . . than their own native wilderness can produce. The mere offer of these simple inducements in any part of the Niam-Niam lands would be sufficient to gather a whole host of followers and vassals."²³ The Tuareg slaves are at the mercy of their masters, but the latter take care not to kill the goose that lays the golden eggs. The situation of these captives may be compared to that of vassals; in certain groups it is miserable, in others it is even enviable. "As a general thing, the Tuaregs are rather kind to their servants, rarely use them brutally, do not sell them, and are intimate with them."²⁴ In spite of the mild form which slavery takes in East Africa, it is the bane of the district and precludes any steady and secure advance, on account of the slave trade and the incursions of the Somal and Galla, while the Arabs are the greatest curse of all.²⁵ "In the Mohammedan field, the slave who survives the horrors of the raid and of the caravan journey to the coast, and who safely reaches his destination in the house or in the fields of a Mohammedan master, may deem himself happy when he recalls the frightful scenes he has witnessed, but his lot is far from enviable. Although it is an exaggeration to say that the Koran teaches and encourages slavery and slave trade, it is bad enough that it allows these evils; even in recommending mild treatment Mohammed was not in advance of the moralists of his age. On the whole, slavery among Mohammedans is severer than among untutored Africans in the same measure as the Mohammedan culture surpasses that of the heathen, yet it seems to be less cruel than European slavery."²⁶

On the west coast more than in any other part of Africa has slavery flourished, and it was here that the Europeans came for the human cargo destined to work the plantations of the New World. But even here slaves were on the whole well treated by the natives.²⁷ Along the Congo, slaves worked for their master at anything he set them to do, although they were often allowed some choice; all that the slave earned belonged to the master. "The master had to house his slave, feed him, clothe him, look after him in sickness, protect and help him in trouble, and find a wife for him when old enough to marry. . . . The children were slaves and belonged to their master. A slave

might be sold at any moment to pay his master's debts, and so be separated from his wife and children, or he might be killed to accompany his deceased master, or to carry a message to his master's ancestor. Except for these two great disabilities, his lot was not hard; he cost too much, and escape was too easy to other masters in distant towns, for ill-treatment to be prudent." Though the writer has known a few slaves to run away, he has seen more than a few treated like members of the family.²⁸ In order to keep a hold on the slaves in Togo, they are soon married; then they establish their own household, working, as soon as children come, only four days a week for their masters. The rest of the time they can use to their own advantage. Usually the slave is free from all labor when his children are old enough to work in his place the customary number of days of the week for the master. The older slaves even have slaves of their own, who replace them in bondage. Slaves are usually inherited from father to son, but after the death of their second master they are free; female slaves become free through marriage with a free man, and the children of such a marriage are also free and can attain even to royal dignities. Children of a slave father and free mother are free but they cannot come into the council. In short, slavery, at least in Bassari, is only a condition of service in which the slave is reckoned with the family.²⁹ In southern Cameroons the slaves live with the master's family; children of a slave-marriage may not be sold and are already half free. While the master may beat his slave, cut off his ears if he runs away, or sell him, he may not kill him even though he has slain one of the master's relatives. If a slave is continually mistreated, he can run away and go to another master who must protect him from the former one and not return him. If one slave buys another and gives him to his master, he becomes half free.³⁰ In Nigeria the slaves, who were usually war-captives, were well treated although the chief had power of life and death over his slave and sometimes killed him when vexed. Cases occurred here where slaves rose to be kings and chiefs.³¹ A system of internal slavery existed in Sierra Leone, "but it is mainly of a very mild character, and unless in war-times, slaves seldom desert their masters."³² In Ashanti, barring the liability of being sent at any moment to serve his master in the next world, the lot of a slave is not generally one of hardship. "As a general rule, the slave is considered a member of the family, and, if he be native-born, succeeds in some cases, in default of an heir, to the property. He intermarries with his master's children, eats with him from the same dish, and shares in all his amusements. Slaves of all kinds are allowed to acquire property of their own, which they can use as they please, as long as they continue to serve their masters. It not unfrequently happens that the slave acquires slaves of his own, and sometimes he attains wealth and a position superior to that of his master. . . . The slave addresses his master as 'my father,' and is himself addressed as 'my son'; and their mutual relations are very well expressed by these terms."³³ The same general situation prevails with the neighboring Ewe-speaking peoples, among whom, as in West Africa generally, the

condition of slavery is not regarded as degrading and a slave is not considered an inferior being.³⁴

From the foregoing account it should be clear that domestic slavery as practised by the Africans is a thing quite different from the wholesale enslavement, forced labor on plantations, and harsh treatment which Europeans have meted out to the less civilized races, and to the negroes in particular. Sir Charles Dundas³⁵ discerningly remarks: "However we may condemn the practice of slavery among Africans, it affords a striking illustration of comparatively speaking humane instincts in these primitive people, for the terrors of slavery as practised by white men not much more than a century ago were never known to the Africans. It is often difficult for the European to distinguish marriage from slavery in Africa, but this is due less to the lowly position of women than to the surprisingly liberal treatment of slaves."³⁶ With the arrival of Europeans on the west coast of Africa began a traffic in slaves to the New World which did not end until many millions had been transported; with them also began the slave raids, the depopulating of villages, and the death of countless natives either through the hardships connected with the march to the coast or the overcrowded, neglected conditions of the slave-ships. Livingstone estimated that for every slave actually exported, nineteen others died on the way.³⁷ Klose³⁸ has remarked that, while native slavery meant no special hardships, the slave raid brought horror with it and involved the domestic ruin of Africa. "Murder and arson are the rule in this business. Great villages and tracts of land were laid waste and depopulated through the slave hunts. Although to-day the black human merchandise cannot be sent overseas, the Mohammedan courts still use a large number of slaves." Most of the European nations took part in the slave-trade, the Portuguese being the first and probably the greatest of the traders. Some of the coast negroes, in particular the Dahomans, acted as intermediaries, and waged war to get captives for sale to the whites; war became through the slave trade an important source of income and one exploited with regularity.³⁹ Africa then and for the first time became acquainted with slavery as a developed system of exploitation. In some respects the slave trade ameliorated conditions among the natives in Africa, for it placed a value on human life by making a person a marketable commodity and thereby checked the slaughter of prisoners of war and the practice of human sacrifice, while contact with the whites introduced certain cultural advantages, but on the other hand it added to the sum total of human misery and was the greatest destructive force to orderly and peaceful development. The worst form of slave labor was that endured on plantations owned by the more civilized nations. Despite prohibitions, slavery, slave-raids, slave-markets, and the slave-trade still continue in Abyssinia, French, British, and Italian Somaliland, Eritrea, Egypt, Tripoli, the Libyan Desert, Morocco, Rio de Oro, Liberia, the Soudan, the Hedjaz, Arabia, Afghanistan, Tibet, in most independent Mohammedan states, and in several other territories. This statement is based upon the report presented to the League of Nations in September, 1925, by its Temporary Slavery Commission, which was composed of British,

French, Belgian, Portuguese, and Dutch officials who had had much experience in colonial administration.⁴⁰

Though Africa affords the classic example of all types of slavery, evidence from other parts of the world, especially as related to domestic servitude, may be considered so as to round out the survey of this important institution. The Ossetes of Transcaucasia have slaves whom they treat as members of the family.⁴¹ In the Chin Hills a man had the same right to kill or sell his slave as his dog, but the bad treatment of slaves was rare and on the whole their lives were far from what the term slavery would lead one to expect. "Among the Siyins it was a point of honor not to ravish Burmese captives, and the women who lived with Chins as their wives usually consented to do so. The Siyins themselves look on a slave-holder who is cruel to his slaves in the same way that we look upon a bully. . . . A slave has naturally to work for his living, but his day's work is neither long nor arduous; all that he earns belongs to his master; his food is the same as his master's, except in times of scarcity, when he fares badly and has to subsist on what roots he can find in the jungle and on the roots of the plantain tree. At feasts he drinks with the chiefs and, when drunk, will knock them down as readily as any freeman."⁴² In the Chittagong Hills slavery is a recognized institution, the slaves being chiefly captives taken in war. "It is considered wrong for a master to take advantage of a female slave in his house. A master's slaves are his children, and they are always treated well. If a man's wife dies, he may marry one of his slaves, but by doing so he at once raises her to the position and privileges of a free woman."⁴³ In earlier times in southern India fifteen species of slaves were recognized, of which four types could never obtain their liberty without the consent of their owners, while the others might obtain their freedom under stipulated conditions; slave women, however, bearing sons to their masters, became free. The British had great difficulty in suppressing the traffic in slaves, especially as related to the agricultural class and the children who were sold by famine-stricken parents.⁴⁴ Slavery has never been an important factor in China except in connection with the custom of selling children. The law requires the owners of domestic slaves to provide husbands for their females, and prohibits the involuntary or forcible separation of husband and wife, or parents and children, when the latter are of tender age. "It is worthy of note," comments Williams,⁴⁵ "how few have been the slaves in China, and how easy has been their condition in comparison with what it was in Greece and Rome. Owing chiefly to the prevalence of education in the liberal principles of the Four Books, China has been saved from this disintegrating element." In Korea there have been two classes of slaves: government slaves and those belonging to the nobility. "They are very well treated and rarely evince any desire to become freemen. Indeed Koreans frequently offer themselves and their families as slaves to the richer nobles. Slavery, however, is fast dying out."⁴⁶ All told, slavery in Asia has never meant what Europe and America have made

of it. "It is a curious consequence of this humanity of custom that the word 'slave' cannot be made to sting the Asiatic consciousness, as it does the European."⁴⁷

A part of the domestic establishment of a chief in central Borneo consists of slaves who are prisoners of war or their descendants. "The relations between master and man are such that one must have mingled for a long time among the Kayans in order to know who of them are slaves." Some are better off than free men; they may even be sent for months at a time to trade among other tribes, with a share in the profits; while some get to be priests and priestesses and win wide influence.⁴⁸ In British North Borneo slaves were divided into two groups, the indoor and the outdoor, and their status carefully regulated. Among other things, "no master can refuse permission to his slave to free him or herself, or his or her children, whether indoor or outdoor, nor can he refuse permission to a slave to seek a new master, but he can complain to the courts if he has reason to think anyone has endeavored to entice away his slave."⁴⁹ Any slave may be free on paying a value of four pounds, "but in most cases they have been brought up as ordinary members of the family, and have no wish to leave their home. Cases of unkind treatment are very few and far between."⁵⁰ On the east coast of Borneo, the relation was rather that of follower and lord than of slave and master, and slavery was so much in the mores that an English settler could not get men to work for him for wages: they deemed it degrading to do so, but said they would work for him if he would buy them.⁵¹ The Dusuns will not have slaves, nor will they sell their children, nor will they give up runaway slaves.⁵¹ "The slaves of the Sea-Dyaks do not in general appear to be hardly treated, as in their wars only such as are young are taken captive; these, after living with their captors for some years, lose the remembrance of their families, or, perhaps, only recollect that they were destroyed, and consequently fall into the customs and practices of the people amongst whom they live, and from whose power they soon lose all hope of deliverance. In many instances, children who have been taken from the Land-Dyaks become so endeared to their conquerors that these latter adopt them as their own, and they are then admitted to all the privileges of the free-born of the tribe, and intermarry with the sons and daughters of the other inhabitants of the village. . . . In the villages the slaves are not distinguishable from their masters and mistresses, as they live all together, and fare precisely the same, eating from the same dish and of the same food."⁵¹ Slaves among the tribes of Timor are not treated harshly; their manumission can be obtained at any time by paying a fixed fee, when the slave rises to his former master's rank. "Slaves rarely seem to care for their freedom. Their livelihood is more secure with their masters."⁵²

Among the aborigines of North America the condition of the bondman seems generally to have been little inferior to that of his master, whom he assisted in paddling, fishing, and hunting, even in making war on neighboring tribes. Usually he was a prisoner of war, though in the western section there was a rather active traffic in slaves, largely in the hands of the Chinook. "The distinction between the slave and the free man was especially sharply drawn in

all ceremonial practices, from which slaves were rigidly excluded, and generally also with regard to marriage, for the slave usually could not mate with a free man or woman."⁵³ Since the Indians subsisted mainly by hunting and fishing, slavery was not a developed institution among them.

In Mexico the lot of the slave was easy, though if incorrigible he could be sold or used for sacrifice; he could have other slaves and devote some time each day to his own affairs, while his children were free.⁵⁴ Slaves among the Paraguay Indians were well treated though held to be an inferior race.⁵⁵ The servitude of Indian slaves to other Indians in Guiana—a condition of affairs which exists up to the present day—was “almost invariably of the nature subsisting between friend and friend rather than one of master and servant. . . . This good treatment meted out by Indians to Indians was well known to the older writers.” But while the practice of enslaving one another had existed among the Indians from the earliest times, it was of a nature very different from the servitude which they later came to know at the hands of the whites. After the conquest, the trade in slaves was encouraged and abetted by the Europeans, the religious, military, and civil authorities all lending their countenance and furnishing assistance. “The Spanish Jesuits, unlike the Franciscan, Dominican, and Augustinian monks, earned an unenviable notoriety for the drastic measures they resorted to in their so-called conquest of souls,” while “the Dutch made no secret of their slave raids among the natives, and openly pursued the trade, either directly or indirectly, through other Indians, notably the Carib.”⁵⁶ Failure to enslave the Indians extensively gave impetus to the importation of negroes from Africa, from which there developed the great slave trade of modern times.

There is evidence among the civilized peoples of antiquity of the existence of slavery as an institution and, in some instances, of harsher treatment than was usual among less advanced groups. In the Code of Hammurabi the status of the slave is well-defined: if he marries a free wife, the children are free and may inherit property from the mother; if he strikes the man's son or disputes ownership, his ear may be cut off; if he is killed, he is to be replaced (being viewed as property, not as a human life); a native slave may not be sold to a foreigner; if such sale is proved, the slave is freed.⁵⁷ The Jewish laws about slaves come first among the laws in the “Book of Covenants.” A male slave, with his wife, is to be freed in the seventh year, unless he prefers to remain a slave. A man may sell his daughter into slavery, i.e., to be a concubine. The female slave is also set free in the seventh year, and persons so freed are to be given gifts when they depart. The slaves were war-captives, or bought persons, or criminals. The lot of slaves was not hard: the owners had not the power of life and death; the slave could acquire property; if the slave was an Israelite he was protected by especial restrictions on the master in behalf of fellow-countrymen.⁵⁸ Among the Avesta people, captured enemies were utilized as servants and slaves and apparently received humane treatment.⁵⁹ The two great classical states, more especially Rome, built their

power on slavery. "Both states pursued their interests with little care for the pain they might inflict on others, or the cost in the happiness of others. The Roman state began by subjugating its nearest neighbors. It used its war captives as slaves, increased its power, conquered more, and repeated the process until it used up all the known world." In Homer three main classes of servants exist: slaves by descent, born in the household; captives in war; and bought slaves; but one class does not seem inferior to another either in privileges or in social estimation. Female captives were often taken as concubines. At Athens slaves enjoyed great freedom of manners and conduct. "They dressed like the poorest freedmen. No one dare misuse the slave of another simply because he was a slave. If the master abused a slave, the latter had an asylum in the temple and could demand to be sold. Slaves could pursue any trade which they knew, paying a stipulated sum to their owners, and could thus buy their manumission. Their happiness, however, depended on the will of another. In the law they were owned as things were, and could be given, lent, sold, and bequeathed. They could not possess property, nor have wives in assured exclusive possession against masters. Their children belonged to their masters."⁶⁰ It is in ancient Rome that we find slavery most thoroughly developed, and the slaves most harshly treated. Mommsen says that compared with those of the Roman slaves the sum of all the negro ills is but a drop. Free laborers disappeared when conquest rendered slaves numerous and cheap. "They were systematically worked as hard as it was possible to make them work, and were sold or exposed to perish when too old to work. Such was the policy taught by the elder Cato. The number on the market was always great; the price was low; it was more advantageous to work them so hard that they had no time or strength to plot revolts. This is the most cynical refusal to regard slaves as human beings which can be found in history."⁶¹ Among the ancient Germans, slaves, who were usually prisoners of war, counted for nothing politically, were regarded as domestic animals, could be sold or killed.⁶² Slavery continued in the Christian empire until it was removed in the Teutonic lands through a different legal form, viz., bond-service.⁶³

§105. Slavery for Debt and Crime.

THE means employed in East Africa for compelling a debtor to pay are various and curious, and commonly terminate in enslavement. Among some tribes a man may surround his debtor's house with fire until he pays; in another district he may be given permission by the chief to extinguish his debtor's fire time after time until the latter is compelled to pay lest he starve; in many parts the creditor may plunder his debtor entirely, or take what he pleases, or what he is owed; in still other districts the creditor has the right to enslave the debtor or his wife and children; while among another group a creditor may hinder the burial of his debtor's corpse until the debt is paid.¹ In the Upper Congo the methods of collection are just as strange to us and as drastic: "To recover

a debt a creditor would first dun the debtor until he was tired, then he would break the pots and saucepans and anything he found outside the debtor's house, and tell him that on a certain day he would call again for the money. If the debtor then failed to pay, the creditor would call a few of his friends together and would lie in ambush near the farms until the wife of the debtor came along, when they would pounce upon her and take her to their town. The woman would be lightly tied and well treated. The debtor would hear of the capture, and, supposing he owed 1,000 brass rods, he would get the money together as soon as possible and take it and 500 extra rods, which he would have to pay his creditor to compensate himself and friends for the trouble of tying up the woman and cost of feeding her. . . . If the debt is not paid the creditor can keep the woman or women as his own wives, if they are free women, or keep them or sell them if they are slave women. If a man has no wives, then a member or members of his family may be tied up on the same principle as shown above. Sometimes a creditor would seize people of the same town as his debtor, but this was rarely done except in cases of hostility between towns."² Interest, in East Central Africa, is enormous, "amounting to cent. per cent. at three months, and the debtor usually stays with his creditor until the debt is paid off. If eventually he cannot pay he becomes the slave of his creditor. Slave-children, slave-wives, slaves, and cattle of the debtor can be seized by the creditor, but the latter's chief usually interferes and lends him money at a tremendous rate of interest to pay off the debt; thus it often happens that the greater number of the inhabitants of a village become the slaves of their chief. If a debtor dies, his brother must discharge the debt; there is no claim on the corpse. War often follows the non-payment of debts, and traders of the same tribe as the debtor are seized and often killed."³

Many Africans have been made slaves by famine. Not many Jekris, in the Niger Protectorate, are free; generally it is only the chiefs and their families, the rest of the people being slaves. Fathers who are hard pressed will sell or pawn a son, who is for the time being a slave, but is redeemable. A pawn is a person placed in temporary bondage to another, by the head of the family or, in the case of a pawned slave, by the owner, either to pay a debt or to obtain a loan. The head of a family has the right, with certain limitations, to pawn any of his relations. Also a man or woman can pawn himself or herself for a loan and by repayment become free again.⁴ Among the Ewe, "the pawn remains in the service of the creditor till the debt, with interest, is paid by the pawnner, services to the creditor counting nothing toward the liquidation of the debt. If a pawn should die, the person who pawned him is bound to replace him by another, or else pay the debt."⁵ In Togoland debt-slavery is common and the whole family must answer for the debts of any member;⁶ while in south Cameroons a man who cannot pay his debts must go to the creditor and work for him until he or his relatives have paid up, his work for the creditor not counting as payment; the debtor can also settle his debt through his wife or daughter, who may become the property of the creditor; his son may also be given as a pledge but can be held only until the account is paid.⁷

Under the system of pawning, especially since the interest-rate on the original

debt may be fifty per cent or more,⁸ many persons are condemned to life-long bondage. The pawns are in some cases never redeemed; they are servants but not slaves.⁹ In the Lower Congo region, litigation between families ultimately takes the form of debt, "and as it frequently happens that payment is delayed, or even impossible, these dependents remain all their life under the authority of the new master. Their condition is, however, not worse than before, and they are indifferent as to their ownership. The only claim on them is a part of their earnings, which in any case they would have to make over to somebody or other."¹⁰ In the Upper Congo districts the same custom prevailed, the status of the pawn being somewhat higher than that of a slave in that he might be redeemed and thus become again a free person. "Such pawns never run away, as the whole of their family connections are in the neighbourhood."¹¹

In the Chin Hills of India, a man who had accumulated debts which he could not pay, applied to some well-to-do man to pay them for him, and consented to become his slave until he repaid the debt, which he often failed to do.¹² Among the Kuki-Lushai clans "orphans or destitute people could join the chief's household, getting food, shelter and protection in return for their labour; these could purchase their freedom by the payment of one *mithan*, that is a tame bison."¹³ Debt-slavery was common in the Chittagong Hills, among some of the outlying districts of Tibet, and in South India; in the last case there were included those given up as a pledge for money borrowed, those fed and kept alive in famine times, those binding themselves for money borrowed, and those unable to pay gambling debts.¹⁴

The above cases are typical, but the East Indies have formed, perhaps, the classic ground for debt-slavery. Wilken¹⁵ shows how, when the regulative system is still undeveloped, individual settlement of difficulties of all sorts still obtains; and among these settlements is the seizure for debt of an individual or one of his kin. This may be carried even to the seizure of his corpse. The author cites numerous examples, chiefly from the people of the Archipelago, and states that interest on debts is often 100 per cent. "Qui non habet in aere, luat in corpore" is, then, a rule that is found everywhere." Among the Malays, a common way of getting into debt-slavery is through gambling, to which they are wholly devoted.¹⁶ In the essence of the thing, says Perclaeler,¹⁷ *pandeling* (being in pawn for debt) and slavery are perfectly identical; and "the free Dyak cherishes the deepest contempt for the *pandeling*." And he goes on to describe the manner in which unscrupulous wealthy men play on the baser passions of the unwary, pressing money upon them, which they promptly spend, and then fall into their sad lot—hard labor and many blows at slight provocation. In Borneo the term *budak* is generally applied to an indebted person who has lost social standing thereby and is to all intents and purposes a slave. The owner is entitled to kill his *budaks* on the occasion of the religious feasts, taking for this purpose those who are of low descent and who cannot boast of free family relatives. The final settlement of such a person's debt, when he has succeeded in wiping it off, is accompanied by a great many expenses; on

8 Letourneau, *Commerce*, 131, 267-269, 295, 316, 367, 401-403, 416, 430, 462, 474, 485.

the other hand, a badly disposed owner has hundreds of ways, if he so desires, of keeping the pawn in debt and therefore in servitude, as for instance by fining him for innocent little transgressions. In some districts there are no real *budaks*, but those who at the end of three years, being unable to pay their debts, become slaves, or *samboats*; "then they are bound to obey their creditors and to work for them without being allowed their freedom, not even in case they possess the necessary means to satisfy their debt. They remain with their children and grandchildren forever in a state of subjection."¹⁸

How a traffic in debt-slaves may develop is illustrated in the case of the island of Nias. A Malay trader buys a number of slaves or war-captives from a chief and takes them on his ship to another island; he then goes to a Chinese and states that these people, who are willing to work there, are in debt to him for their passage. The Chinese takes over the people in Nias who are supposed to be in debt, and settles their account; he then sells them clothing and other things at a high price and occasionally gives them an advance so that they may satisfy their passion for gambling. He keeps this up until the debt of the men has grown to a large sum. As the rate of pay agreed upon is very little, while the interest on the advances is extortionate, the debt gradually mounts until the debtor is unable to settle it and becomes a slave.¹⁹

In Sumatra the debtors seem to be less miserable. They are allowed subsistence and clothing, although the product of their labor is not applied to the diminution of their debt. "Their condition is better than that of pure slavery, in this, that the creditor cannot strike them, and they can change their masters, by prevailing on another person to pay their debt, and accept of their labor on the same terms. Of course, they may obtain their liberty, if they can by any means procure a sum equal to their debt; whereas a slave, though possessing ever so large property, has not the right of purchasing his liberty." But descent to pure slavery is possible. If the creditor formally demands the amount of his debt three separate times, and the debtor cannot persuade anyone to redeem him, he becomes a real slave, upon the creditor's giving notice to the chief of the transaction. "This is the resource he has against the laziness or untoward behavior of his debtor, who might otherwise . . . be only a burthen to him. . . . The simple manners of the people require that their servants (debtors) should live, in a great measure, on a footing of equality with the rest of the family, which is inconsistent with the authority necessary to be maintained over slaves, who have no principle to restrain them but that of personal fear, and know that their civil condition cannot be altered for the worse."²⁰ Debt-slavery exists also in Celebes,²¹ while in the Philippines most of the slaves have lost their liberty because they were not able to pay debts contracted by themselves or their fathers, with the result that, even when the debt was insignificant, a man passed easily from freedom to servitude.²²

When a Tlinkit loans another money, he expects twice as much in settlement, whether the borrower pays the sum back within a week or ten years.²³ Among some of the Indians in Oregon, children of very poor parents were sometimes

taken and sold to pay debts,²⁴ while in Mexico such children made up one of the classes of slaves.²⁵

In all the ancient states the rate of interest was excessive. Usury was forbidden between Jews, and entirely by the Koran, while legislation in Egypt fixed the amount as not exceeding the principal, and the laws of Manu specified the interest-rates in detail. A debtor among the Israelites was not to be a slave, but to give service until the year of jubilee. A widow tells Elisha that her husband's creditors will come and take her two sons to be bondmen; again, the man who could not pay was to be sold with his wife and children.²⁶ In the Avesta time a free man could lose his independence by pawning himself, while in Rome, where the laws were especially severe, the creditor could put the debtor to death or sell him to strangers.²⁷

Enslavement for crime. Enslavement as a punishment for crime is not so common as debt-slavery. The Marutse of South Africa are generally free from servitude, but they can be forced to it if arraigned and sentenced for some offence or if they incur the disfavor of the king.²⁸ Among the Wachaga, the punishment set for crimes against property is "that the thief shall pay double the worth of what is stolen, in cattle or products of the field. If he cannot, restitution is made through the sale of his wife or his children. If he is unmarried, he must pay his debt as a slave in the service of the injured party."²⁹ "It is noteworthy that the negroes at first gave up [for enslavement] only their criminals and those convicted of witchcraft." That in this slavery was the alternative to death, as in many primitive societies, is indicated by the rest of the quotation: "Since this deportation is no longer possible, the latter [witches] are killed."³⁰ Miss Kingsley³¹ reports of the coast negroes that a man condemned to death for murder or adultery can give a slave to be executed for himself. In Ashanti, a man and woman discovered *in delicto* in the bush, or in the open air, are by custom the slaves of the person who discovers them, but are redeemable by their families.³² Among the Ewe-speaking peoples an important class of native-born slaves consists of those who have been condemned to slavery for crimes or misdemeanors.³³

In northeast Africa, the thief caught in the act, or one proved a thief by the evidence of theft, falls into slavery; "and this Draconian severity is made use of, in other tribes too, by the Galla chiefs, for they favor this kind of punishment. And so it comes about, for example, in Djimma and its neighborhood, that half of the population languishes in conditions of slavery, although sale into foreign parts is relatively uncommon."³⁴ Of a people of Madagascar it is said that "they or their ancestors have become slaves either from having been sold for debt, or as a punishment for political offences or for certain crimes. The cruel code of native laws up to about sixteen years ago demanded not only death for many offences, but also reduced the culprit's wife and children to

slavery."³⁵ In the Chin Hills of India, if a man was caught stealing, he gave his daughter or son into slavery, until he paid some twenty times the value of what he had stolen.³⁶ In Ceylon, a sentence for theft, incendiarism, and other crimes meant slavery.³⁷

"In the old days, according to the old Dyak laws, people who were careless enough to set a house on fire rendered themselves liable to become slaves to those who had been burnt out, and this may have gone as far as two or three generations, so that the grandchildren were slaves by birth."³⁸ Murderers and other offenders were condemned to perpetual slavery.³⁹ In the East Indies generally, punishment for wrongdoing, along with debt, are the usual causes of slavery, and since fines are common, debt may follow from crime.⁴⁰ In Timor-laut, if a man steals and cannot restore, or owes and cannot pay debts, he becomes a slave of the man from whom he has stolen or borrowed. The parallelism between debt-slavery and slavery in consequence of crime is here self-evident. If a man accuse another falsely of being a thief, or speak ill without a cause, so as to bring anyone to shame before the village, he may become his victim's slave. In any of these cases he may be redeemed for a heavy ransom.⁴¹

Present-day barbers in China compose a peculiar class of society. They are descendants of criminals of the Sung dynasty (900-1200 A.D.) who, on condemnation, have lost their civil rights and have passed their disabilities down to their offspring. Born a barber, a person must labor as a barber, and remain as such ineligible for literary examination—that is, for an official career.⁴² In Japan, finally, degradation to slavery was a common punishment in early times; debtors became the slaves of creditors and thieves of those they had robbed.⁴³

§113. The Rôle of Vanity and of Ghost-Fear in Property-Formation.

THE motives of hunger, love, vanity, and ghost-fear lead to the acquisition of many familiar forms of property that do not need rehearsal. Why men make property out of material things that are useful in self-maintenance is clear enough to anyone. That a wife and children, or a slave, may be property is not difficult to understand—certainly not, when one has informed himself upon the primitive family relations.¹ Vanity is in any age a determinative of the identity and nature of property. The motive of ghost-fear produces what are to us odd forms of property and property-tenure. A few selected examples of primitive forms of property should help to get the lowest terms of the institution before us.

It is interesting to review the brief inventory of the effects of a savage who has almost no property at all. The traveller Holub² lists the possessions of an old Bushwoman and her son. She was lying on a skin between thornbushes, which represented shelter. They had one block of wood for a head-rest, another for a chair, a turtle-shell for a water-holder, a rude pot, and a flat stick; these

articles "completed the property of these two unexacting mortals who, except as they sometimes felt hunger, made no demands on life or man." But the Bushmen generally have more property than this: bows and arrows, ostrich-eggs, gourds, tortoise-shells, rough earthen pots, and dogs. They wear amulet-trophy-ornaments and some clothing, and possess a weighted root-digger, fire-sticks, a rude musical instrument, a sun-umbrella to protect children, and a clapper for games.³ Fritsch⁴ reports the Bushman as "the true philosopher," very indifferent to property.

The Australian's bag of private effects contains round stones, with which he works sorcery upon enemies, and the fat of someone he has killed, all carefully wrapped in bark and painted with red ocher. His wife carries, besides the rude domestic implements, the leg of a native bear, the head of a kangaroo, and often the hands of some defunct member of the tribe—a friend or perhaps a former husband.⁵ The little pouch carried by the Papuan contains knife, tobacco, and lighting materials, and is hung at the head of his grave.⁶ In New Guinea, the chief man's ornament, given a youth by his father right after the circumcision-ceremony, is an arm-ring, called *tsáně*; and this word "is at the same time also the word for possession or property, *par excellence*."⁷

"Chignon [false hair] and cattle-herds form the highest earthly fortune among the common Maschukulumbe; and chignon, cattle-herds, and human skulls among their chiefs. Next to these comes the pipe." They "spare no sacrifices" to get a certain shell-talisman which is thought to afford protection against all possible evils, sickness, mishaps, wiles of wild beasts or enemies, and even the bullets of the white men.⁸ The pursuit of the local form of property becomes a passion; among the Fan "ivory is everywhere an evil thing before which the quest for gold sinks into a parlour game."⁹ On the Loango Coast rings of iron and copper serve "partly for decoration, partly as fetish-amulets."¹⁰

Certain tribes of Borneo set their hearts on brass in any shape; a local sultan had a jar which gave oracles of death by moaning. It was put away covered with gold-embroidered brocade. The owner said that no offer would tempt him to part with it.¹¹ To the Pelew Islander the hand-basket in which he carries about his betel is very sacred; "nobody may touch it, step over it, or take anything out of it."¹²

Among the Kwakiutl Indians a peculiar kind of dance is a property, or a personal attribute; there are strict rules of descent by which it devolves from one man to another, by marriage or by killing the former owner.¹³ Family names were as much private property as other of the belongings of the Salish, and in the old days no one would dream of taking a name from another person's family. "These names were never mere tags or labels to distinguish one person from another but were always connected with the family legends, and had reference to some true or fancied incident in the life of the ancestors of the family possessing them."¹⁴ Among the Wyandots "each individual has the exclusive right to the possession and use of a particular amulet."¹⁵ Of the

Seri stone implement, the chief one used by this very primitive people, McGee¹⁶ writes: "Though initially a natural pebble chosen nearly at random from the beach, it eventually becomes personal property, acquires fetishistic import, and is buried with the owner at his death." This is a strong piece of evidence as to the simplest form of appropriation and its sequels. "Among the Miranhas," says Von Martius,¹⁷ "there was one who wore a necklace of very large ounce-teeth. In vain did I offer him several axes for it. His pride withstood every temptation . . . for that trophy of a brave hunting-encounter exalted him in the eyes of his fellow-tribesmen."

A few additional cases may be added to those in the text on the potlatch—the reckless distribution of property for the purpose of self-glorification. Jones¹⁸ describes the custom among the Tlinkits as follows: "The man who gives one receives honour and public esteem for himself and his family in proportion to the amount he gives away. He is the most renowned who has given the greatest or the greatest number of potlatches. A man who is ambitious to give a potlatch will save and stint for years, even to the extent of denying himself and family the necessities of life, that he may give as big a one as possible. The members of his family contribute their quota and endure the privations it entails. From two to five thousand dollars worth of goods are sometimes given away in a single potlatch. Men absolutely impoverish themselves and families, but their poverty is patiently endured for the name that has been established. Henceforth the man is an honoured member of the community, however low he was before he gave the potlatch. He and his will be given a seat of honour in all public functions and a liberal share of what is distributed in every feast to which they are invited." Among the Salish, blankets were not regarded as garments or bedding; they were the measure of a man's wealth. "It was the ambition of most men to amass a number of these and then distribute them by means of a potlatch, and so acquire social distinction and make a profitable investment at one and the same time."¹⁹ Every important event in life was celebrated by the Tsimshians with a feast and potlatch. "An essential feature of the Tsimshian potlatch and of that of the tribes farther to the south is the opportunity it gives for the public announcement of events that are important for the social standing of the individual. The public announcement gives the legal claim to the social advance made at the time; and the higher the honor claimed, the wider must be the circle of witnesses or the degree of publicity." Among the various occasions on which potlatches were given was the public bestowal of a name, for each person had different names as his social position was advanced in the course of his life. A man who gives many potlatches becomes a great chief. "Thus it is," comments Boas,²⁰ from whose account these facts have been taken, "that there is a vast amount of dead stock accumulated in the camp doomed never to be used, but only now and then to be transferred from hand to hand for the mere vanity of the thing. There is another way, however, in which property is disposed of even more foolishly. If a person be insulted, meet with an accident, or in any way suffer an injury, real or supposed, either of mind or body, property must at once be sacrificed to avoid disgrace.

A number of blankets, shirts, or cotton, according to the rank of the person, is torn into small pieces and carried off." It is astonishing what they will do or suffer in order to establish or maintain dignity.

§114. Communal Property.

THAT food is often regarded by primitive peoples as the common possession of the group is evidenced in the following instances. In Atjeh, "when the fish are on the bank you always see persons who have actually had nothing to do with the fishing . . . appropriate a couple of handfuls or a little basketful and go off without paying anything or without any one taking notice of it. To me, also," the author¹ goes on, "some fish were often offered, and at last I noticed that it was not agreeable . . . when I refused the gift." The native feels it a duty, "which indeed has its origin in self-interest, that he shall give a small part of the fish he brings to the shore to anyone who happens to be present." Among the Maori "the taking of whales, seals, etc., was very tapu [taboo], and woe betide the man who cut up or tasted one of these creatures till the ceremony of making the animal 'common' had taken place."²

As late as 1845 the Dyaks of Borneo knew nothing about payment and barter with regard to the common articles of livelihood; "they, therefore, unless they do it from the start without asking, cannot be brought to do what is wanted by means of presents and . . . on the contrary find it quite right if one allows one's people to take as many fowls and as much fruit as one requires. In the same way they know nothing about theft and do not hesitate to help themselves to the fruits in your garden or to the tobacco in your hand as much as they are immediately in need of. They never take more."³ On Easter Island, in the Marquesas group, and elsewhere in Polynesia joint-households are found; one could come in and share from the pot, and then go without thanks, just as Morgan describes the case among the Six Nations.⁴ The Marquesas Islander carried no provisions on a journey; if he was hungry he went into some hut and, without asking permission, dipped his hand into the tub of bread-fruit paste. He was only exercising a right, and needed neither to ask leave or give thanks.⁵ In Tahiti "a man divided everything in common with his friend, and the extent of the word friend was, by them, only bounded by the universe; if he was reduced to his last morsel of bread, he cheerfully divided it with the friend." Laws introduced by the missionaries to protect private property were submitted to with reluctance. Community of ownership in such things prevailed to a greater or less degree in the Society Islands, as it did in Samoa and Tonga; "request for a wife or child, or any other precious thing had to be complied with 'subject to reciprocity.'" In another of the Polynesian group "the common uncultivated pandanus was regarded as the property of every one, even if it grew in a man's own plot"; and among some of the Melanesians it was allowable for a hungry man to take and eat bananas from another man's garden.⁶ Various writers draw attention to the hindrance to advancement which the Polynesian system involved, for "no sooner did one man successfully strike an independent line of industry of his own, than down came upon him a

swarm of his relations, insisting by all family ties and country customs upon a division of the fruits of his labour. Brown says that stealing from the plantation of a relative was not considered wrong, and in fact was not called stealing; it was simply a part of the communistic system under which no man could rise above the level of his fellows. The industrious man might work, whilst the lazy relative helped himself from the fruit of his labours."⁷

In East Greenland all present share in a seal, and in the case of the first one of the season, even if they do not belong to the village.⁸ Nansen⁹ says that there are but few kinds of animals which the hunter can keep for himself and his family; he gets a comparatively small part of even a walrus killed without help; and "if there is a famine in the village he must after all this give a feast or share with others so that they are not at the hazard each one of each day's take." This last remark is very significant. The Central Eskimo too shares widely when food is scarce; while in times of plenty only the housemates receive part of the quarry.¹⁰ Many of the Tlinkits own no home personally, but move about from house to house among the tribe. "They are never at a loss to find some place in which to stay, and that without cost. If the owner is not at home any of his tribe may go in and make themselves at home, and stay as long as they please."¹¹

Among many of the Indians of both North and South America there was practical community in the matter of food; "a man who was hungry need never suffer;" he could go in anywhere and have food set before him.¹² Some of the Indians, as the Mandans, had no regular or stated times for their meals; the pot was always boiling over the fire, and any one who was hungry had a right to order it taken off, and to fall to eating as he pleased. "Such is an unvarying custom amongst the North American Indians. . . . He, however, who thus begs when he is able to hunt, pays dear for his meat, for he is stigmatized with the disgraceful epithet of a poltroon and a beggar."¹³ On the Orinoco, the fishermen leave their canoes without touching a fish in them and proceed to their houses to rest; the women and boys load up the fish and heap it before the doors of the captains, who divide the spoil in due proportion among the heads of families, according to the number of children.¹⁴ Among the Coroados of Brazil, "the inhabitants of the hut, or any neighbor or individual of the same tribe, who happens to be present, takes part in the meal; every one without regard to precedence pulls off a piece of the meat [and] squats down with it."¹⁵ Among the Fuegians, those who first find a dead whale have the right to distribute it. They try to evade the duty of sharing; as long as a party can safely keep a whale to themselves they take care not to spread the news. They hoard the blubber for months, by burying it in mud or under a run of fresh water. If the monopolizers are found out, the rush of people, coming too late, in their disappointment either force a partition or resort to violence.¹⁶

The ancient Jews were allowed to pluck corn and grapes on another's property and eat them then and there, but not to carry them away.¹⁷ In the house-community of the South Slavonians, Dalmatians, and others, "every member

of the body has an absolute right to be maintained, housed, and clothed out of the common fund."¹⁸

The various shadings of communalism in things other than food are brought out in the cases which follow. "The organization of the Australian horde is essentially communistic. Personal property consists merely of such weapons and tools as each man can carry with him on his wanderings."¹⁹ In Australia the stones for axes were procured in special localities, which were the property of local groups of men without the permission of whom the stone could not be removed.²⁰ Definite communism of property still flourishes in one form or another throughout Melanesia.²¹ In one of these island groups, even a work-boy's trade is not his personal property; "it belongs to all the family in common, and as many as can will gather round to see it opened out. Besides the loin-cloth and the belt and knife that the lad is wearing—these he is usually allowed to keep, at least for a time—he will probably bring a mirror and a pair of scissors, a second knife perhaps, and red shell ear-pendants manufactured by the whites. One thing is never lacking, the stick-tobacco varying from ten to thirty pounds in weight according to the time that he has served at work. His elder brother presides over the distribution of all this wealth, and the rest of the kinsfolk aid him with copious suggestions; as for the boy, he must content himself with looking on, and take with proper gratitude the tiny fraction of all his gains that may be allotted to him."²²

In West Africa private property constantly merges into public property on the death of its individual owner, but tribal and family property cannot become private.²³ Among the Kabyles the goods in a family are not divided up, and the income is used for the sustenance and support of all members without distinction. The community gives every one the tools for labor, a gun, and the capital for business or trade; but the recipient has to dedicate his labor to the community and pay his earnings completely into the hands of the family head.²⁴

In theory, at least, a woman may belong to the group: among certain Alfurs of Buru and Ceram the bride-price is paid or received by the members of the family-group as a whole. This is "the best proof of the most intimate economic solidarity. The woman so bought is thereafter the property of the whole group and is assigned to her husband, as it were, only for use during the period of his life. After his death each member of the group has the right to court the widow without paying a bride-price." The same situation occurs in Timor. These house and village communities show at the same time a community of property and industry; above all is land the common property of the group.²⁵

Nansen²⁶ says of the Eskimo that with respect to the right of property there is a certain communism within three widening groups: first, the family, second the housemates and kinsfolk, and third the village. Private property is most fully recognized in the hunting-boat and hunting-weapons which belong to the hunter alone and which no one else may touch. Snow-shoes are also implements of the chase, but as they were introduced by Europeans, they have

26 *Esk. Life*, 108.

become private property in a lesser degree; while an Eskimo seldom or never touches another's weapons, he will not scruple to use another's snow-shoes without leave.

Next to clothes and hunting-implements come the tools used in the houses, such as knives, saws, and skin-cutters. Many of these, and especially the women's sewing-materials, are altogether private property. Other household-implements are the common property of the family or even of all the occupants of the house. The woman's boat and the tent belong to the father of the family, or to the family as a whole. The house belongs to all its inmates. Although they have no private property in land, there is a recognized rule that no one shall pitch a tent or build a house at a place where people are already settled, without obtaining their consent. Also where dams have been built in a salmon river to collect the fish, it is regarded as wrong for strangers to interfere with the dam or to fish in that water. Drift-wood belongs to the first finder; to establish a right he must drag it above high-water mark and if possible mark it. Under such conditions no one will touch it, even for years; one who did would be regarded as a scoundrel. If a man borrows a thing and harm comes to it, he must make it good. They never borrow if they can help it; and if a debtor dies, the creditor never makes any claims. If anyone has a surplus, he is held bound to share it with the others. Among the Bering Strait Eskimo, "if a man borrows from another and fails to return the article, he is not held to account for it. This is done under the general feeling that if a person had enough property to enable him to lend some of it, he has more than he needs. The one who makes the loan under these circumstances does not even feel justified in asking a return of the article, and waits for it to be given back voluntarily."²⁷ Rink²⁸ finds that "the right of any individual to hold more than a certain amount of property was, if not regulated by law, at least jealously watched by the rest of the community, and that, virtually, the surplus of any individual or community—fixed by the arbitrary rate which tradition or custom had assigned—was made over to those who had less."

The Eskimo evidence seems to form a consistent story; but the tribes at Point Barrow afford a clear exception, for there the idea of individual ownership is much more strongly developed.²⁹ All of these Arctic cases are significant. The conditions of life, especially of the Eastern and Central Eskimo, are such that they mold the mores perforce, all along the line.³⁰ Where industrial organization, war, government, law, and class-restrictions are no more than rudimentary, differentiation in forms of property could not be expected. The mores here reveal the "strain of consistency" characteristic of them.³¹ Under such conditions of the natural environment, combined with such a degree of isolation, doubtless the immediate adjustment lay in the direction of communalism. Evidently the field for the display of individualism was limited.

As for the American Indians, we have the broad generalization that "the basis of the Indian social organization was the kinship-system. By its provisions almost all property was possessed in common by the gens or clan. Food, the most important of all, was by no means left to be exclusively enjoyed by the individual or the family obtaining it."³² In all the eastern part of North America, in a great part of the northwest and in many districts of

²⁷ Nelson, in BAE, XVIII, pt. I, 294.

³² Powell, in BAE, VII, 34.

South America, female descent and inheritance prevailed; and under such circumstances an individual man had no property but his clothes and weapons. He did not inherit, but the clan, rather, inherited from him. There was, therefore, scarcely anything but clan-property, and private property was but sparsely represented.³³ Among the Omahas, household-property "consisted of the right of occupancy of a common dwelling, the right of persons to shares of fish, game, etc., acquired by any member of the household."³⁴ "Proprietary rights with reference to the eagle inhere in the clan rather than in the individual; nests, eaglets, and adult eagles are owned by the whole clan, not by any one member." The Hopi have corporate charms and talismans, which are the palladia of the group.³⁵ The Tupinambas of South America seem to have provided a favorable field for Franciscan teaching, "since their goods and whatever they have is common to all those in the house, likewise the iron tools—the things they value highest—as well as the clothing."³⁶

Strabo³⁷ says of the ancient Arabs that they had property common among the relations, administered by the eldest; it was correlative with communalism in women; so the Basques have communal property inside the family.³⁸ Such general statements could be matched from many other places and times. One of the many instances of communism in practice is the following reference to colonial Virginia; this colony had been managed from the beginning on the community plan, all sharing the work and such provisions as were at command. Governor Dale, on his arrival, "allotted all the settlers private gardens," and "gave each man three acres of cleared ground to farm for himself and his family, and we are informed that when they were 'fed out of the common store and labored jointly together, glad was he that could slip from his labor, or slumber over his taske, he cared not how, nay the most honest among them would hardly take so much paines in a weeke as now for themselves they will doe in a day.' As a result, a declining Colony, that had lost about 80 per cent. of its founders largely through lack of provisions and supplies, was turned into a flourishing one."³⁹

§117. Land as a Maintenance-Area.

THE general principle to be illustrated is that the concept of property in land, at first either wanting or vaguely defined, acquired definiteness, proceeding from communalism toward individualism along with advance in the self-maintenance organization.

Among the backward tribes of West Australia, "the country of a local group, with all its products, animal, vegetable, and mineral, belongs to the members of the group in common. Any member has the right to hunt over the country of his group at all times. He may not, however, hunt over the country of any other local group without the permission of the owners." Hunting or collecting vegetable products on the country of another local group constitutes an act of trespass. While tribal boundary lines are thus rather closely defined, there is no evidence among them of the individual ownership of any part of the soil or any of its products.¹ On the D'Entrecasteaux Islands each

district is the common possession of the natives who inhabit it, and trespass on hunting-grounds constitutes an infringement of right.² Elsewhere in Melanesia each group or clan laid claim to hunting-grounds or certain reefs for fishing, on which any member, but no outsider, might hunt or fish.³ The Alfurs of Buru enforce rights to the sea, to a certain distance from shore; strangers must get permission of the district to fish, and pay for it.⁴

In the Upper Congo district the boundaries of a town are well defined, the islands belonging to it being well known to all the other villages in the neighborhood. "If an animal is killed on ground owned by a town other than that to which the huntsman belongs he has to send a portion—generally the head—to the chief of the town that claims that ground."⁵ In East Central Africa communal hunts take place yearly, when the game is driven by setting fire to the dry grass. "It is considered the greatest offence against a village to burn its grass, otherwise no strict bounds are observed."⁶ Originally, "every family of the Nature-Veddahs had its separate hunting-ground, which was recognized by the others. Infringement upon the hunting-ground seldom occurred and then, for the most part, had serious consequences."⁷

Among the North American Indians the hunting-territory was generally regarded as the common property of the whole tribe,⁸ while in South America many peoples, lacking fixed dwellings, had no exclusive territory save the tribal hunting-ground. Such districts were tacitly recognized by neighbors: "any encroachments on these lands lead to quarrels, which are usually settled by a sort of duel between the champions of the respective factions, but which often end in a free fight all around."⁹ The staple food of the Araucanians was the fruit of the pine, which was, of course, not cultivated; "every year during the autumn months excursions are made by the whole tribe to the pine forests, where they remain until they have collected sufficient for the following year. Each tribe has its own district, inherited by custom from generation to generation and inviolate, by unwritten law, from other tribes, even in time of warfare. This harvest was formerly of such supreme importance, that all inter-tribal quarrels and warfares were suspended by mutual accord during this period."¹⁰

Among herders, again, since interest lies in the use rather than in the possession of land, pasturages are generally common property. Among the pastoral Bahima of Africa, land is not regarded as of any value except for grazing purposes; "neither king nor people ever speak of the land as having any value, nor is it carefully delimited as in Uganda." At the same time it is roughly divided up among nine leading chiefs, who have control over their districts in the matter of pasturage. Though they care little for the land, still "they adhere to natural boundaries for their districts and do not trespass into other districts for grazing purposes."¹¹ Among the Akamba "no particular area is set apart for grazing and no title to grazing land is acknowledged. In former days when they could not take their cattle into the plains for fear of the Masai, they were very cramped for grazing ground and it was the

practice to fence certain areas in among the cultivated districts which were set apart as commonage for grazing."¹² There are considerable areas in Africa under the domination of nomadic tribes, such as the Masai of British East Africa, who have established a grazing right for their cattle but claim nothing beyond that. The desire of the agricultural tribes for land is replaced among these nomadic pastorals by the ambition to own cattle. "In other regions—such as Bornu in Nigeria—the poverty of the soil, and the migratory habits of the people, lead to the frequent transfer of villages from one site to another, and consequently to a similar absence of any rigid system of land tenure. Elsewhere we find wandering tribes of pastorals traversing the lands occupied by the settled tribes, who accord to them rights of grazing for their cattle."¹³

The tendency toward more rigid definition of property in land is clearly marked among agricultural groups, though there are cases where farming-land is still regarded as the property of the community. Although individual property in land exists at present in Melanesia, communal ownership used to be the rule and traces of it are still to be found. Land in some sections is the property of the whole hamlet, not of any individual or family; within an area belonging to the district as a whole each hamlet holds a tract in usufruct, the various portions of which are cultivated in turn. Over the non-cultivated tracts, retained by the district, all may range in search of fish, game, or fruit. On some of the islands each man has his share in the garden-land, which descends to his children. This land is assigned to him by the clan chief, after discussion with the elders, and the whole clan turns out to help in the work of clearing it. In the old days land was never sold; when heirs to any given area failed, it reverted to the clan. "Garden making on another man's land is frequent, his permission being first obtained, and a portion of the crop being given him in return."¹⁴

Among the agricultural peoples of British Tropical Africa land is wanted for its usufruct, and though there may be private property in that respect there is none in land itself. "The produce of the land is the property of the occupier, and he may own trees planted by himself, either on unoccupied land or on land occupied by another. He may sell or pawn the crops on his land, or trees owned by him, but not the land itself. He may be ousted from his holding for offences against the community. . . . A chief acts as trustee for the tribe in regard to land. He is joint owner with his people, and he cannot exercise any proprietary rights without the co-operation of his people." The fundamental characteristic of land tenure here seems to be an individual holding derived from the common stock at the disposal of the tribe or family. Evidence is available that such a tenure tends to develop rapidly into individual ownership. "The conception of individual ownership," the author¹⁵ remarks significantly, "is promoted by the cultivation of permanent crops which take long to mature, such as cocoa, rubber, etc. It is remarkable with what tenacity the native mind holds to the idea of private ownership, or at least of the absolute right to tenure in perpetuity."

In the case of the Bangala, "within the boundary the people of the town were free to make their farms and build their houses where they liked, provided the land was not already occupied by someone else. Priority of occupation is the

only title to a piece of land."¹⁶ Among the Lumbwa there is no individual property in land, though growing crops are objects of inheritance and sale.¹⁷ The same general considerations apply widely in East Africa: in Ukamba "wherever a man cultivates or builds a village on virgin soil he acquires a right to that land, and no one can cultivate or settle there without his permission." The title to the land never lapses, yet "ownership relates only to the right to build on or cultivate the land. Grazing, timber and water are common property everywhere." In Kikuyu all untitled land is free to anyone to use for grazing and timber; the tribe has a collective interest in the land, even though that which is cultivated is private. Among the Wachaga every clan has its own area, but within this each member's particular banana-grove is his own property, as must be the case where permanent cultivation exists. The land on which maize and other crops are cultivated is distributed by the chief. No title is therewith conveyed, for the cultivator has a right to the crop only. By the Wadigo cocoplantations are cultivated extensively and are to all intents and purposes private lands; but according to local law it is only the trees which are owned, not the land. Among a number of tribes ownership is acquired by cultivation but is lost by disuse during several years. Land is not and really cannot be sold; any payment is regarded only as a recompense for the labor expended on clearance by the first owner.¹⁸

In Central Polynesia title to land was by occupation. Land was the common property of the septs or families, though there was individual ownership in a sense, because a title could be acquired by cultivation and sons inherited fathers' land; but no land-owner could devise his holding to anyone outside the limit of his sept, and in default of heirs the land reverted to the head of the sept for assignment to other members of it. In the case of the more permanent crops the tendency toward exclusive possession was strong: "The planting of yams or plantains by permission conferred no title, but the planting of coconuts did so; thus, there being no boundary marks, encroachment by planting these trees was a continual cause of friction."¹⁹ The tendency toward exclusive appropriation was also manifest in the case of the American Indians who planted their corn in the same places each year and those who made an extensive investment for irrigating.²⁰

The primitive notion of property in land appears clearly in the matter of alienation. To the native mind, uninfluenced by foreign ideas, land is an unsalable thing. The East African says that all land belongs to God and that to sell it amounts to stealing. In recent years Arabs and other aliens have purchased plantations in this section, but the native himself never comprehends a complete sale of land: "to him it is never more than a mortgage, and therefore he obstinately claims the right to reacquire his plantation at any time by merely refunding the purchase price, deeming that the purchaser has had good value for his money, in that during the interval he had the produce of the plantation." The most striking and consistent feature of the Bantu law is that land is unsalable.²¹ "We have power to dispose of the land; we cannot sell the land; no chief can sell the land," said a Lagos chief in evidence before the Supreme Court in British Tropical Africa. "If an alien requires land, whether he be a

native stranger who desires to cultivate, or a European who desires to trade or mine, the question to the native mind would be, whether or not the stranger's presence is desirable and to the benefit of the community. If it is, he is given land rent-free. He may or may not give a part of his profits or produce in return for the favour conferred upon him. If he does, it has no connection with the land, and is not in proportion to its area. Similarly if the Government takes land for a recognised public purpose, no payment would be demanded, but any person dispossessed would obtain land elsewhere through the chiefs."²² Compare this with the custom in Celebes where the right of the individual to the land occupied by him is, over against that of the district, no property-right but only a right of usufruct. The *jus domini* of the district is recognized in that no one has the right to alienate the land outside the district.²³ In this connection the statement by Letourneau²⁴ with reference to eminent domain may be mentioned: "no matter how it may be understood or used, the right of eminent domain may be looked upon as a survival of primitive communal property."

The selling of land, in the sense of parting forever with the ownership of it for a consideration paid down or otherwise received, does not appear to have been an indigenous practice in Polynesia. Difficulty attended sales of land to white men because the people did not know how far the buying went; "their idea was that it only involved the acquisition of the title of the owner chief, and that the right to use the plantation would still remain to them; just as they had possessed it under the selling chief."²⁵

Neither the individual, among the American Indians, nor the family possessed vested rights in land. "The land belonged to the tribe as a whole, but individual families and clans might appropriate for their own use and tillage any portion of the tribe's unoccupied domain. Hence it was impossible for a chief, family, clan, or any section of a tribe legally to sell or to give away to aliens, white or red, any part of the tribal domain, and the inevitable consequence of illegal sales or gifts was bad feeling, followed often by repudiation of the contract by the tribe as a whole."²⁶ Grinnell²⁷ says that "until within comparatively recent times, all land sales and all treaties have been made by the Indians on the theory that they were passing over to the white people certain rights of occupancy—were lending them the use of the land. These rights in a general way were to live on the land, to pass over it, to cultivate it, to use its waters, the animals that lived on it, the birds that flew over it, and the fish in the streams; yet the Indians looked forward to a time at the end of the loan when the land should be returned to them, when nature would heal the scars made by the white man, when the animals and the birds would reestablish themselves and the fish would increase in the rivers." The author has heard of Indians complaining of mining operations carried on in territory which they had passed over to the whites, "their grievance being that when they thus lent the land they understood that only its surface was to be used, and that while the whites had the right to plow the soil and turn it over for cultivation, their rights of excavation did not go beyond this. They had no right to bore into the ground and to carry away the minerals." Our governmental policy of civilizing the Indians has been based primarily on the owner-

ship of land in fee simple, a concept foreign to the Indian and one which he has had great difficulty in grasping.

§119. Family-Holdings.

THE apportionment of land to families, and the transition thereby afforded to private property in land, are observable among the Papuans, of whom it is said: "The land which a tribe has taken into its possession is divided among the several families, and every family-member then gets his portion assigned by the family-head for his use." The tribal land is mostly under allotment, and since the ranges of other tribes join immediately on the tribal boundaries, it is not easily possible to extend the plantations. To this population-land situation there develops an adjustment, rather exceptional for backward peoples, of sale and rent of land to members of another tribe. The rent is paid by a portion of the harvest.¹ The family-holding is clearly defined by permanent land-marks, such as trees, swamps, and small hills. The male head of the family partitions it at the commencement of each annual planting-season.² In South-east Papua, five classes of land are distinguished: village land; village site, abandoned but claimed by the original owners; garden plot; clump of trees; and land without an owner. "Land is divided amongst families, and every individual has his own portion. Land is never sold, and cannot be alienated. It can be loaned for a term. A person dying may bequeath a portion to one not of his family, but the land returns to the family on the death of the legatee." The boundaries are marked by small stones, which indicate each person's property. Inheritance of land is in the female line.³

In British Tropical Africa "the tribal land at the disposal of the chief might be allotted either to families which had outgrown their family lands, or to strangers who desired to settle among the tribe, provided that they paid the customary tribute and dues. Family lands are at the disposal of the head of the family, and every member of the family has a right to a share in the land—a right which is not forfeited even by prolonged absence. The holder and his descendants have undisturbed possession in perpetuity, and all rights of ownership, except that they cannot alienate the land so as to deprive the chief of his ultimate control over it. The occupier's title is held by virtue of his membership of the family, and perpetuates in the name of its head."⁴ The same general situation prevails in East Africa, and although the senior member of the family is designated as the owner, he is so only as representative of the family. "Any member has the right to cultivate the land, but no individual member has the right to sell it. Such is practically never done, but if any land is sold it must be by consent of all the senior members of the family."⁵ The Kabyle joint-family is highly developed and exhibits a strict union of property and work; "in no nation do we find a combination which is nearer to equality and farther from communism."⁶

In Coorg (India) "previous to Tipu's invasion, divisions of property and separation of families were rare; large house-communions existed, and it was not uncommon to find thirty-five or forty grown-up male relations and many

families consisting of upwards of one hundred or even one hundred and twenty members living under the same roof." Periodic reallocation was to be found in many parts of India. In Peshawa and in the Delhi district, "the redistribution took place after the lapse of five, fifteen, or even twenty or thirty years."⁷ "The Indian joint-family rests upon the community of dwelling, meals, religion, and property. The common preparation of food and the eating together is . . . the most visible external mark of belonging together, and the members of the family are therefore designated in downright manner as 'those who cook together.'"⁸

Among the wild Veddahs of Ceylon each family has a portion of the jungle allotted to it;⁹ while in the Malay Peninsula individual property does not exist, its place being taken by family property. "So, too, cultivation is carried on in common, and the plantation is cultivated by all the members of the family under the direction of the father, extra work being imposed in default. The produce is shared between all the members of the family."¹⁰ In the East Indies all the land and in some instances the sago-bushes, tend to become family-property. The district remains the virtual owner of the land and can prevent the holder from selling to strangers; the holders have merely the usufruct, though they can sell or mortgage to fellow-members of the district. If strangers want to own land, they must become district-members. In the Javanese village-community (*desa*), as there is too much land to make a correct division annually, one party often remains for years in possession of the same piece. The author quoted¹¹ thinks that the communal possession of land in Java dates from a remote period, since it has formed itself in so natural a way; in some places where there is no communism, the settlement is thin, and all have a large choice; there is a superfluity of land for the men. In Polynesia, but especially in Samoa, "the land belonging to each family is well known, and the person who, for the time being, holds the title of the family head, has the right to dispose of it. It is the same with the chiefs. . . . Although the power of selling land, and doing other things of importance affecting all the members of the family, is vested in the titled head of the family, yet the said responsible party dare not do anything without formally consulting all concerned. Were he to persist in attempting to do otherwise, they would take his title from him, and give it to another. The members of a family can thus take the title from their head, and heads of families can unite and take the title from their chief, and give it to his brother, or uncle, or some other member of the chief family, who, they think, will act more in accordance with their wishes."¹²

It is noteworthy that a Greek peasant-holding was called a *klēros* (lot).¹³ According to Cæsar, confirmed by Tacitus,¹⁴ the Germans had no private property in land, but it was divided and allotted, year by year, to kin-groups; and among the Suevi no one held the same fields for more than a year. In ancient Ireland the case was similar: "By the Irish custom of Gavelkind, the inferior tenancies were partible among all the males of the Sept (small kin-

ship group), both Bastards and Legitimate; and, after partition made, if any one of the Sept had died, his portion was not divided among his sonnes, but the Chief of the Sept made a new partition of all the lands belonging to that Sept, and gave every one his part according to his antiquity."¹⁵

Communal land with allotments is a modern phenomenon in Russia. Much has been made of it. The oldest Russian law book indicates the existence of strictly private property in land.¹⁶ In a Russian village, "after the expiration of a given, but not in all cases of the same, period, separate ownerships are extinguished, the land of the village is thrown into a mass, and then it is redistributed among the families composing the community, according to their number. This repartition having been effected, the rights of families and of individuals are again allowed to branch out into various lines, which they continue to follow till another period of division comes round."¹⁷ The Slavic village community (*mir*) is not, apparently, a "natural" development, in the sense of preceding examples, but one due to special conditions, largely political. It is relatively modern and is a case of involuntary social cohesion under great pressure. "Its significance rested exclusively upon the levy of taxes. In this lay the unity of the community, and through this did it attain the character of such—in other respects the individuals who composed it had nothing in common with one another. . . . The Russian community has not developed itself by a natural growth, is not a society that has come into existence through free union, but has been organized by the government."¹⁸

Quite different appears to be the house-community of the South Slavs, known as the *zadruga*; a Croatian law of 1870 defines it as follows: "Several families or persons who, under the leadership of a head, dwell in the same house and manage the household, work together an undivided property, and enjoy the income communally, form a union which is called a *Zadruga*."¹⁹ Unlike the Russian village-community, in which there is redistribution, the house-societies of the South Slavs were invariable, that is, a certain family held a certain estate. The individual could lay claim to certain rights only in so far as he was a member of a family and lived in inseparable relations with the family. Property was not the share of a single person but belonged to the entire family as something common. Many writers think the *zadruga* a primitive form of domestic life, a natural development out of special conditions; when the conditions change—as they have in recent years with the coming in of a money economy and the impossibility of free occupation with the soil—this form of adjustment declines.²⁰

§120. Ownership by the Chief.

AN excellent case illustrating the transition from communal property in land or from family-holdings to private property *via* ownership by the chief is that of the Yoruba tribes of West Africa, for Ellis¹ states: "The notion that land, and not merely its usufruct, may be the property of the individual, instead of the community, is beginning to appear, for a chief can sell or give away land. No one but a chief can sell land; it is one of the prerogatives of chieftainship; but the land sold or given away must be unoccupied waste-land, the usufruct of which has not been yielded to any member of the community." The West African law regards property as attached to the "Stool" or the "Cap" of the king; "but he is trustee, not owner of the Stool property, and his family don't come in for the property on his death, for every profit made by the working of Stool property is like this itself the property of the Stool, and during the king's life he cannot legally alienate it for his own personal advantage, but can only administer it for the benefit of the Stool."² More definite is the ownership of the chief among the cattle-raising Bahima and more numerous are his duties: he has "to see that all the cattle in his district are cared for, that their pasturage is good, herding thorough, and that sick animals are tended; he must prevent the various guardians from killing too many for his own use, or selling them. Any one selling cattle or killing too many is deprived of all, and condemned as being unsuited for the office of herdsman, and injurious to the king's interests. . . . Even cattle taken in war, directly they reach the country, belong to the king."³ The Wachaga chief owns all the spears, an important item of property among them in their struggle with the Masai; no spears may be made without his consent.⁴ How important the connection of property and the chieftainship is may be gathered from the statement made with reference to the Ba-Mbala, that "land is owned by the chiefs, or rather, a man who owns land becomes a chief;"⁵ or from the Loango Coast custom that, whereas after the death of a common person his hut is abandoned, when a prince dies, the whole village is moved.⁶ Among the Kikuyu, "no sale or donation of land is considered valid unless it receives the formal consent of the chief. Even if, however, a landowner sells his land with the chief's consent, the chief appears to still exercise manorial rights over the land, for it is said that he can dispossess the new-comer if he seriously offends the tribal law. Every clan has its grazing lands which are common to all the members, and adjacent clans often graze their stock on each other's common land. The chief is however considered to be within his rights if he disposes of part of the common for agricultural purposes."⁷ In Madagascar "all lands whether cultivated or not belong to the sovereign," who can evict a holder without warning or compensation and can prevent any use of land by the holder, since for its use the king's permission is required.⁸

The Bantu king "cares in many ways for his people. They do work for their lord and receive for it something from his possessions which they use as theirs. This condition of affairs is at present on the wane, since war has become less frequent and many have won private property for themselves by

working for the whites."⁹ Such cases evolve at length into the right, real or fictitious, of a ruler of advanced nations compounded of several peoples. Under the Emperor of China "is the whole body of the people, a great family bound implicitly to obey his will as being that of heaven, and possessing no right or property *per se*; in fact, having nothing but what has been derived from or may at any time be reclaimed by him."¹⁰ Baden-Powell¹¹ states that, as time went on, the local princes in India came to claim not only the waste but a right of ownership in all land whatever, and that they adopted the plan of granting to court-favorites, to ministers of state, and to military officers, the right to collect the revenue of a certain area of country and to take the amount collected, either to support their state and dignity, or—in the case of military chiefs—to equip a body of troops, to be available for the royal service. The right of seigneur in central Java in former times extended to the taking of each unmarried maid as concubine.¹²

In Samoa the land was owned alike by the chiefs and heads of families. The land belonging to each family was well known, and the person who for the time being held the title of the head of the family had the right to dispose of it. It was the same with the chiefs. In one of the Hervey Islands the soil was the sole property of the high chiefs and the under-chiefs, and these distributed the land in accordance with their own wishes.¹³

The American Indian chiefs had, naturally enough, no great connection with cultivated land, except as they stood for their tribes; as, for example, when the land about Guilford, Connecticut, was bought of a sachem squaw who appears alone as vendor.¹⁴ Ancient Peru is widely regarded as having been a sort of communal state; but "it is a complete inversion of the facts to assert that all land in Peru belonged to the Incas and was let out to the common people, graciously, so to speak, as a sort of fief."¹⁵ Here, again, we are in the presence of a complicated political development.

§121. Personal Property.

PROPERTY-MARKS are probably more common in Australia than present records show; a number has been noted on wild bee-hives as well as on arms, tools, and the like.¹ Very curious often are the personal belongings of the Melanesians and the methods adopted to keep possession of them exclusive. Among the Koita "a man's most valued possessions in these days are his pig and dog, his ornaments and dancing plumes, and in the days before the white man's coming, his weapons, adze and canoe were doubtless almost equally valuable. . . . With the advent of the store, one article has attained immense popularity. This is a camphor wood box, with the lock so arranged as to ring a bell when the key is turned. It is the ambition of every man to possess one of these, its key is often worn round the neck as a pendant, and it is certain that old keys may be worn for 'swagger' by youths who have never owned a box, and by men who have traded or gambled away the box they once possessed."² Pigs

and dogs, canoes, fishing nets, ornaments, and other native wealth in south-east Papua belong to the individual or the family; "all things too large for individual ownership are owned by the family."³ In some of the Solomons, birds, called *malau*, which have not yet been domesticated, have become private property.⁴ In British New Guinea there exists a sort of patent right, which makes exclusive to the originator a special make of pipe, a new variation in the mode of building a house, or, in fact, anything so long as it is something visible, such as a design.⁵ Throughout Melanesia the badges of societies serve to protect the property and especially the gardens of members. A special feature of the Banks Islands property-mark is that it protects property only from persons other than the members of the society of which it is the badge; there is no inducement therefore for a man to join a large society, for his property will be better protected if he belongs to a small one. If, however, he belongs to a great many societies he may by combining their badges be able to protect his property against the whole of the rest of the population. A man who takes property protected by the badge of a society to which he does not belong, and is found out, has to give a pig to the members of the society that he has disregarded. "The use of the badges of the societies as protective signs plays a large part in disputes connected with gardens. If two men have a dispute about a garden, one may keep the other away by putting up the badge of a society to which the other does not belong and the latter may retort in a similar manner and keep his opponent away by the use of the badge of another society."⁶

The African Bushman who finds a bee's nest breaks off a stick and sets it up in the ground near by, being sure that his claim will be respected.⁷ Some of the African Pygmies "stick an arrow into a bunch of bananas which is still hanging on the stalk, and announce thereby their claim to the fruit when ripe;" and bananas thus marked are not touched. Though the sanction here would seem to be not so much fear of the supernatural as of the vengeance of the dwarf-people themselves, yet the latter are held in considerable superstitious awe.⁸ Besides their stock marks,⁹ Africans use stronger devices. A magic powder may furnish the taboo; the highest ears in the corn-field are smeared with it; and "a touch of this magical substance on the part of the thief would bring about his immediate death."¹⁰ "On either side of the path," says Miss Kingsley,¹¹ "we continually passed pieces of rubber vine cut into lengths of some two feet or so, and on the top one or two leaves plaited together, or a piece of bush rope tied into a knot, which indicated whose property the pile was." The *jujus*, or fetishes, safe-guard property; anyone who removes an article protected by them will surely die.¹²

Among the Ostiaks the property-mark is hereditary in the family. The Votyaks have one for each family; if there is more than one son, the mark is split up and each takes a part of it. The Ainos mark household chattels with the owner's device; and trees which have been cut down in the forest are

also so marked.¹³ In New Zealand, "an inferior kind of tapu exists which any one may use; a person who finds a piece of drift timber secures it for himself by tying something around it, or giving it a chop with his axe; in a similar way he can appropriate to his own use whatever is naturally common to all. A person may thus stop up a road through his ground, and often leaves his property in exposed places, with merely this simple tohu or sign, to show it is private, and it is allowed to remain untouched, however many may pass that way; so with a simple bit of flax a man secured the door of his house, containing all his valuables, or his food store, they were thus rendered inviolable and no one would meddle with them."¹⁴

Among the items of personal property of the American Indians are listed songs and rites pertaining to the use of healing herbs, whose owner could teach them to another on receiving the prescribed payment. "The right to say or sing rituals and ritual songs had to be purchased from their owner or keeper. Occasionally a spectator with quick memory might catch a ritual or a song, but he would not dare to repeat what he remembered until he had properly paid for it." The right to practise tattooing also belonged to certain men in the tribe.¹⁵ Among the Dakota "the tipi might belong to either parent and was obtained by that parent through some ancestor who had had its character revealed in a dream or who had captured it in war."¹⁶ An Indian hunter established his claim to an animal by his personal mark upon the arrow which inflicted the fatal wound.¹⁷ The Nez Percés and many other tribes lean a pole across the door to indicate the absence of the family, and no one molests the dwelling.¹⁸

In ancient Chaldæa landed property was put under the guarantee of the gods. It was transferred by ceremonies partly religious, partly magical. The grantor pronounced execrations against anyone who should dispute or attack their authenticity. These execrations were written on oval stones and fastened up at the corner of the field; on them were carved the divinities who watched over the sacredness of the contract.¹⁹ Petrie²⁰ says that marks to denote property were common as early as 6000 B.C. and that they seem to be the origin of signs which later developed into an alphabet.

§122. Property in Trees.

FRUIT-TREES, among the Papuans, belong to those who planted them, even if on someone else's land. "In a village every tree has its owner, though a young heir has the right to climb any tree."¹ In British New Guinea, "the woods are common property, but the land on which the trees stand, when cleared, goes over into the possession of the cultivator. Though the fruit-trees generally belong to the owner of the ground in which they stand, yet if they were planted before the ground was owned the land-holder has no right to tree or fruit, but only the right of compensation, chiefly from a part of the fruit. . . . In certain localities the custom is that after the death of a village-member, his coconut trees are inviolable, or even that, in his honor, a coconut tree

that belonged to him is cut down."² In the Torres Straits Islands every coco-palm is owned, and most of the inhabitants of an island appear to know the owner of every tree.³ In this part of the world one "whole island was planted with cocoanut trees, each bearing the different marks of its owners, and it is astonishing that though some may belong to a man who perhaps lives many miles away, and in another country, and who only comes once or twice a year to collect the nuts, there is not a being on the island who could be persuaded to steal one."⁴ "Fruit trees planted, with the consent and acquiescence of the owner, upon another man's land, remain the property of the planter and of his heirs. In a true sale, the minute and accurate knowledge of property in land and trees is remarkably displayed."⁵ An unusual case of inheritance arises in connection with the ownership of trees on the land of others, which is a frequent occurrence in the Banks Islands; in this case, the son of the owner of the tree inherits it, but he has to pay money at the time to the owner of the land; even when inheritance was in general matrilineal, trees on the land of others were an exception to the rule.⁶

In Africa, Bastian⁷ found that "whoever first prepares a palm-tree to yield palm-wine is its owner." On the Upper Congo the palm-trees wherever found are never without owners. "The proprietary rights in these trees are by inheritance, or by planting them, and the rights in them are handed on from father to son in the proper line of heirship."⁸ It is the custom in the Fezzan that everybody may pluck the dates or pick them up, as long as they are not ripe enough to be cut. They may eat on the spot as many as they like, but may not carry any home.⁹ In all the oases of the Sahara, trees may be owned by others than the owners of the land, and can be inherited, given away, or sold. Disputes arise concerning irrigation: "here perhaps the owner of the land, in order to ripen his wheat and tomatoes, has the fields watered oftener than the palm-tree owner regards as endurable; while there the owner of the date-palms wants to garner his dates—a thing which the owner of the ground tries to hinder, because, in his opinion, his crops will be trampled in the process." Considerable complication arises.¹⁰

Recognition of separate ownership of cultivated trees was common in Polynesia, and in the Society Islands not only had every portion of land its respective owner, but even the distinct trees on the land sometimes had different proprietors, and a tree and the land on which it grew might have different owners. Formerly every breadfruit and coconut tree had its proprietors, and a single tree sometimes had two. Subsequently, however, extensive clusters or groves of trees were to be met with, that had no other owner than the chief of the district in which they grew. "It was formerly their practice to gather the fruit of these, in its season, without asking the consent of any one. The proprietor of the land could appropriate to his own use any number of trees by affixing such marks [taboo signs] as were indications that they were prohibited; but later, as the population increased, the people became more careful of their trees, and the practice of gathering promiscuously the fruit from those trees not enclosed, appeared generally undesirable."¹¹

§123. Personal Holdings in Land.

THE following typical cases of private property in land should be scanned with the population-land ratio in mind. In East Africa, the Wakarra distinguish themselves in custom from other Bantus: "They are a people living on an island, every acre of which is cultivated, and the land therefore has a high value, consequently individual tenure has been evolved and is very pronounced. Every piece of land is privately owned and inherited. The owner may sell his land, but when doing so will consult his relatives in order that they may purchase it if they so wish."¹ The rest of the neighboring Bantu, it should be noted, have developed only up to family-holdings in land; the greater density of population on the island-restricted territory of the Wakarra has forced the latter to the most highly evolved system of land-tenure to be found in this section, with only a vestige of the idea of family claim to land.

In the Naga Hills of India "private rights of property in land are the rule amongst all the tribes in this district except . . . the migratory tribes. That private rights of property in land are not recognized amongst these tribes is due to the fact that they are in no way pressed for land, the villages being small and uncut jungles extensive. When, however, we come to tribes . . . who live in permanent and large villages, and amongst whom land is none too plentiful, we find that the rights of individuals to property in land are well known and well recognized, and the rules as to inheritance and partition of such property settled by strict customary law."² "Land is freely bought and sold by the Angamis of this district, especially permanent terraced cultivation," that is, land in which the investment is important.³ "As civilization advanced, and the advance of the commerce therewith gave an impetus to men to follow various kinds of industry to derive wealth, the wealth so derived from separate acquisitions brought into existence self-acquired [private] property."⁴ In Oudh "no historical evidence takes us back to any other state of things than that where each villager held his own fields;" in the northwest provinces, "the village group of Manu's time—each man claiming his own holding—was the original condition of things."⁵

In the country of the Hill Dyaks, "where beasts of burden do not assist the farmer in bringing home the produce of his lands, it is a great advantage to the cultivator to have his field as near to the village as possible, and among the tribes living at a distance from the river-banks, or where the brooks are too small to admit of the use of the canoe, the property in the vicinity of the houses is divided into plots, which are the acknowledged property of certain individuals."⁶ In northern Sumatra, "the prior possessor of a piece of land, or his lawful heir, can at all times, even if the land has already for years been turned into waste, make good his rights to it."⁷ Here is a case of peculiarly persistent rights to private property; for in general land that has reverted to waste comes under private ownership again only by re-clearing and cultivation, and is then the property of the one who redeems it. The Polynesians hold the fishing places as private property.⁸ Among the Maori, "land was held by

tribal right, but within this each free warrior of the tribe had particular rights over some portion."⁹

Among the Indians of the Mississippi Valley, "there were no fences to divide the fields, but every man knew his own. . . . The work was done in common, though the fields were divided by proper marks, and the harvest was gathered by each family separately."¹⁰ "The waters are usually regarded by the Navaho as the common property of the tribe, but the cultivable lands in the vicinity are held by the individuals and families as exclusively their own."¹¹ Among the Chinooks who gained their livelihood primarily by fishing, "definitely located fishing stations were a well-recognized form of personal property; the capture of the first salmon of the season was accompanied with a ceremony intended to give that particular fishing station a good season's catch."¹² It is reported of the New England Indians: "I have knowne them make bargain and sale amongst themselves for a small piece or quantity of Ground."¹³

Says Barton¹⁴ of ancient Babylonia: "individual property in land must have existed here several thousand years ago. . . . An unpublished archaic tablet in New York, which probably dates about 6,000 B.C., presents a plot of ground to a temple and so proves that individual ownership of land even then existed." In Deuteronomy we read: "Cursed be he that removeth his neighbor's land-mark."¹⁵ "The usual picture which confronts us in the Old Testament is this, that land ownership was private ownership,"¹⁶ but, even in the later periods, the communal form existed alongside the private. In Homer the gods and kings held a *temenos* (piece cut off) and seem to be the first holders of private property in land. A *temenos* was also a public gift, for protection, and the givers commended their lives and property to its owner; it conveyed royalty with it or was a symbol of the bestowal of royal power. The Homeric system was on its way toward private holdings.¹⁷

Among the Teutons and Slavs private property in land started with the farm-yard, "which we may picture to ourselves even in primitive times as surrounded by a fence of twisted thorns and reeds."¹⁸ Land fit for agriculture, needing only cultivation, was present in superfluity in the Germany of Tacitus; but its superfluity left it without value and it was not an object of the property-interest. Agriculture was almost as primitive in the time of Tacitus as in that of Cæsar.¹⁹ "In North Russia individual property in land was by prior occupation. . . . In districts where game rights were valuable, the forests appropriated by individuals were heritable, salable, and mortgageable. Some such hunting appropriations were several miles square and were marked off by cutting trees on the boundaries with the individual's property-mark."²⁰ Maine²¹ believes that in the Russian village community "the related families no longer hold their land as an indistinguishable common fund—they have portioned it out, at most they redistribute it periodically; sometimes even that

stage has been passed. They are on the high road to modern landed proprietorship."

Property in the Waste. The rest of this section will be devoted to the redemption of waste-land and to similar usages in which individual initiative is recognized, all of which forecasts the development of land-ownership in severalty. A Melanesian custom which indicates foresight is that of planting land for an unborn child, in which case the father does the task with a dried coconut under his left arm or fixed on his left shoulder to represent the child, a coconut being the customary representative of an absent person; land so cultivated is no longer common but is the property of the individual to whom it has been thus assigned by his father.²² While the Malays act much on the coöperative system of cultivating family plots in common, the Papuan, on the other hand, jealously guards his individual plot or garden and, however small or large it may be, surrounds it with a fence.²³

In East Africa, while there is no recognition of property in land in our sense of the word, there is an approach toward that concept through the redemption of waste land, for "anyone almost may clear a piece of forest land and claim it as his own, as long as he wishes to cultivate it. When he dies it becomes, as a matter of course, the property (if indeed it can be called property, where purchase of land is unknown) of his nearest relative."²⁴ In Ukamba most of the land is unowned, "but where a man cultivates he acquires a right to the land which never lapses whether he make use of it or not." Such plots are inherited by all sons, of whom the eldest alone has any right to sell.²⁵ Among the Ba-Mbala of East Central Africa anybody can own land, but he has no right to the crops if raised by the labor of others, though he can, in the first instance, prevent the latter from establishing themselves there. There are no landmarks, but the owner of a piece of land buries a fetish in it; ownership exists as far as ponds and lakes are concerned, but running water has no proprietor.²⁶ Private ownership of land has to some extent made its appearance among the Kavirondo, for although the family in practice share the produce, theoretically the crop from each plot belongs to the member who tilled it.²⁷ With the Akamba every man owns his own *shamba* or cultivated field. "A man can pre-empt an area of unoccupied waste land as long as he marks the boundaries by felling a tree here and there along the proposed boundary line, and by cultivating a small patch within the pre-empted area. This done, his title to the land is recognized by the tribe and he can if he desires sell a portion of a piece of the land so pre-empted to a neighbour."²⁸ On the Upper Congo "men, women and children could own land that they had cleared for farms;"²⁹ while in Nigeria a man is free to mark out a farm on any unoccupied land; "he must consult the spirits, but no permission is necessary from the chief. If he has begun to till the land he establishes a claim to it so long as he keeps it under cultivation, but if he abandons the farm another can then take it."³⁰ In West Africa "a man may take up any unoccupied piece of land in the tract allotted to the community to which he belongs, free of charge, and cultivate it; but if he has access to his plot of ground through a plot be-

longing to another man, he must pay the latter a small sum for his right of way."³¹ The plots are evidently personal property. On the Zanzibar coast anyone may cultivate new land and so get title to it; in this case property is not derived from the chief but comes from appropriation and use.³² According to the Musulman code everything vacant becomes the property of the first occupant; and the Koran assimilates to this category the booty taken from the enemy and the territory conquered from the infidel.³³

The survival-value of such incentive to individual initiative as the above cases and those to follow show, is well depicted by Lugard:³⁴ "The labourer who works on land which is not his own, whether as the serf, or even as the paid servant of an estate owner, or as a unit in a communal estate, has little interest in its improvement during, and none beyond, his own lifetime. And so we find in Africa, 'the oldest of the continents,' no permanent irrigation works, such as those which terrace every hillside in Afghanistan, India, and China. The African plants few trees, and is careless of the productivity of the soil. Individual proprietorship is no doubt inimical to the supply of wage labour for large estates, but it makes for individual progress, thrift, and character. It is the strongest inducement to good farming, and politically an asset to the Government, to which the peasant owes the security of his holding. The French verdict is the same: 'The system of individual ownership is incontestably the one which is most favourable to production.'"

Among the Yakuts the sib (kin-group) allows the land to be appropriated by the improver so long as he does not claim too much and uses all he claims. If he rents any, the sib puts in its claim. The question is whether the improver has got back his capital and pay for his labor.³⁵ "Amongst the settled people of Central Asia the matter of artificial supply of water is as important for prosperity as cattle amongst the nomads. For a farmer to have control of a canal for irrigation means that he is rich. In consequence of this, the ownership of land in this district [chiefly that of the Kirghiz] is based upon the right of 'enlivening'; according to the local law, the fundamental right to the disposition of the land goes solely to him who has watered it; that is, enlivened it."³⁶ The laws of Manu grant the right of private property for clearing.³⁷

Maine³⁸ has shown the difference between ancestral and self-acquired property in India, that is, wealth accumulated by trade and other personal exertion as distinguished from inherited wealth. The Tuareg divide at the death of a man all he has acquired by industry equally among his children, male and female, while things got by force, and regarded as a distinction of nobility—a sort of ancestral possession—go to the oldest son of the oldest sister. The latter are not alienable, but are used to maintain family prestige.³⁹ Evidently land obtained by breaking the waste is assimilated with goods obtained by finding, gift, raiding, buying, earning, or other forms of acquisition by personal initiative. A somewhat similar distinction between inalienable property or heirlooms and transferable estate is made in the D'Entrecasteaux Islands.⁴⁰

To return to India, of peculiar interest among early Indo-Aryan theories of property is "the occupation of a *res nullius* as the foundation of property." The felling of trees gave the property-right. It was like hitting the game first; "whoever hit it afterward, dispatched his arrow in vain. Even through the cultivation of a piece of ground that was lying fallow only temporarily, one gained certain rights to it."⁴¹

In the Indian Archipelago, while in general ownership of all the land belongs to the different *fennas* or districts, an individual has a right to the waste and to all he cultivates, which may be sold, leased, or mortgaged to fellow-members of the *fenna*, or handed down to heirs. In this way has private property in land here developed out of communal. The individual loses his right if he leaves the land uncultivated until it looks again like waste. Only such ground can be mortgaged to which cultivation has lent value, as, especially, irrigated rice-fields. The local idea of mortgage is very different from the European: it can produce no transfer of possession; the only way for the owner actually to lose his land is to pass it over to the mortgagor in return for a share of the harvest or a rental. The mortgage-taker enters into all the rights of the owner but is obliged to return the land as soon as the owner or his heirs can pay up. The duration of the mortgage contract is not fixed and no interest is charged. As a rule the lifting of the mortgage is delayed, sometimes until after two or three generations; this, together with the fact that mortgages are contracted only by vocal agreement, is one of the causes for the land-disputes in the Malay lands, the witnesses being usually dead and the heirs not knowing enough to make the circumstances clear; so they commonly cut the knot by splitting half and half.⁴² As regards the tenure by which land is held by the Sea Dyaks of Borneo, "it has been the immemorial custom that when a person fells the virgin forest, he acquires by that act a perpetual title to the land. It is his from thenceforth to do with as he pleases; he may sell it, or lend it, or let it. . . . The tenure has been modified within late years in view of the increasing demand for accommodation, and it is now generally understood that when the proprietor chooses to leave the district and remove into a distant country, he forfeits, by so doing, all title to the ground, and can no longer exact rent."⁴³

In Polynesia there is some tendency toward private property in land from allotment or from appropriation from the waste,⁴⁴ while the Zufi Indians appear to be in the transitional stage. Among them, if a man takes up a field of unappropriated land, it belongs strictly to him, but is spoken of as the property of his clan and on his death it may be cultivated by any member of that clan, though preferably by near relatives.⁴⁵ Among the Six Nations, while no individual could obtain an absolute title, "he could reduce unoccupied lands to cultivation to any extent he pleased; and so long as he continued to use them, his right to their enjoyment was protected and secured. He could also sell his improvements or bequeath them to his wife and children."⁴⁶ The household head among the Omahas "had a right to cultivate unoccupied land, and add it to his own."⁴⁷

In the ancient Akkadian laws it is provided that a married woman shall possess all she encloses.⁴⁸ Among the Arabs and in the Talmud, what the husbandman irrigates is his, while what is naturally watered belongs to the god who is *baal* or owner of the spot.⁴⁹ "Quod enim nullius est, id ratione naturali occupanti conceditur."⁵⁰ Mediæval economic history is full of provisions about the waste: "the more the population grows, the more agriculture extends, the more the amount of still uncleared land decreases. Thereby this too gradually wins a value, and so arises the property in land or a right even to till uncleared land, or a right to the land as such, quite independently of the work put in on it or the actual possession or cultivation."⁵¹

Modern cases in backward European districts follow the primitive ones: in north Russia individual property in land has existed from ancient times; the first occupant had as much as he could use; it was his while he used it. The meadows which a man cleared were his to the next revision, in forty years.⁵² "Clearing new ground has always been regarded as the most tedious and searching task of the Virginia laborer;"⁵³ it demanded some sort of special inducement. Oliveira Martins⁵⁴ says that between Andalusia and La Mancha the system may still be seen in action. The village possesses a waste where the villagers may pasture pigs, but one who chooses a piece out of it, and, by way of improvement, encloses it with stones collected from it, becomes proprietor of it. According to the customary law of mediæval Portugal he who cleared the land of thicket appropriated it but might not alienate it.

§137. Group-Hostility.

BEFORE Cook came to Australia, one hundred and fifty years ago, it was "a continent of innumerable tribal islands, each island carrying its own scanty population, each semi-isolated from its neighbour, each the possible cradle of a new physical type." There is said to be not a single record of the fusion of two or more tribes,¹ for they were continually at feud, always alert and suspicious: "The track of every one of a tribe's own people was known. A stranger crossing their country would be tracked down and killed as a matter of course, so they had recourse to boots made of hair rope and emu feathers; these effectually disguised the tracks made by their wearer. The fear of the uncanny kept a hostile tribe from attempting to track an unknown man, who might be a moora [ancestor], so that the wearer got a certain amount of liberty."² Although the Australians were not especially warlike, "it is quite true that, if a member of an unknown tribe made his appearance, except of course he come accredited as a sacred messenger, he would most probably be promptly speared. Anything strange is uncanny to the native, who has a peculiar dread of evil magic from a distance. Our two 'boys,' who went with us right through the continent, were particularly careful to keep close to camp, unless well armed, when they got amongst absolutely strange tribes." It seems that contiguous tribes are friendly enough; but "the members of one tribe will tell you that a distant tribe, with which they rarely or perhaps never come into

contact, is very fierce and bloodthirsty and given to making raids. The same tribe will be living upon most friendly terms with its immediate neighbours, and some of the latter will be doing precisely the same thing with the tribe of which your informants are afraid and suspicious." As for the traditional view that the various tribes are regularly hostile to one another, "nothing could be further from the truth;" but it appears that each tribe is surrounded by concentric circles of increasing fear and suspicion, and that the less they know the more apprehensive they are. The exercise of magic by the "giving of a bone," or the abduction of a woman, may lead to enmity and a fight, and someone may be killed, but harmony is restored by compensation. "In the case of a savage it must be remembered that when once compensation in any form has been made by an offending party, the matter is supposed to be ended, and no ill feelings are cherished. Of course there are exceptions to this, but, on the whole, it is strikingly true of the Australian savage."³

In Melanesia, "a stranger as such was generally throughout the islands an enemy to be killed. Thus a stranger who had escaped from a wreck on to an islet was killed when seen, and spoken of as a cocoa-nut that had floated ashore."⁴ Again, they "hate all strangers and regard them as enemies. . . . The killing of a man not belonging to the tribe is not looked upon as murder, but is reckoned as a deserving act, whereby the number of enemies—and everyone not belonging to the tribe is an enemy—is diminished."⁵ "This feeling might be justified if extended toward the intruding white man, but it is difficult to understand when entertained towards nearly all individuals of the same race, provided the distance which separates their respective villages exceeds that which can be accomplished in an easy ramble."⁶ In New Guinea there have long been standing enmities between village communities.⁷

In northern Angola, "every stranger is an enemy, and whoever is not powerful enough to enslave the villagers must himself serve them as such. . . . The farther I led my negroes into regions unknown to them, the more were they under my hand, for, left to themselves, they would all have been immediately enslaved by the first kinglet they encountered."⁸ In Togo, the heart of the native is "full of suspicion, not only against the white stranger, but also, and just as much, against his own countryman and tribal comrade." Not long ago six of these groups, comprising twenty towns and villages were at swords' points.⁹ On the Loango coast there is no sympathy for those outside the blood-bond.¹⁰ The atomism and general attitude of fear and suspicion exhibited by the Teda are described in a previous connection.¹¹ The Galla, despite tribal rivalry and envy, live pretty peacefully among themselves; but any stranger "who has not parents or relatives in the country or has not been accepted in guestfriendship somewhere, is mercilessly persecuted."¹² Robbing and killing the stragglers from caravans is common.¹³

In India, among certain frontier-tribes, the kin-groups, or *khels*, "stand so far apart in hostile feeling that no effort would be made by one to check the massacre, within the village walls, of another. . . . Between the *khels* in the same village great rivalry exists, which in old days used to lead to blood feuds

and frequent fighting, indeed, the inter-*khel* feuds were and are far more bitter than inter-village feuds. . . . One marked peculiarity in their intestine feuds is that we so often find a village divided against itself, one clan being at deadly feud with another, whilst a third lives between them in a state of neutrality, and at perfect peace with both."¹⁴ In Madras, "relations are always entertained and given food, but strangers never. One of another village and a stranger would never ask anything; he would not get it if he did. People of the same village would help one another, but never strangers."¹⁵ The term Lepchas, given to a people in the Himalayas by the usurping Tibetans, means "ill-speakers," just as the term Welsh means, in Saxon, jabberers.¹⁶

The Scythians were very savage against outsiders, but just and kind toward one another.¹⁷ In Korea, every spring, permission is granted to the people to fight with stones, and the men and boys go to the open spaces where stones are plenty, form sides, usually town against country, and have regular pitched battles. Many are killed and wounded.¹⁸ In the Chinese communities in Borneo, and even in China, the village-heads smooth out most of the quarrels; "but this does not prevent hatred and vengefulness from characterizing the relation between neighboring villages, and from degenerating into blood-vengeance when once it has come to fighting and some have fallen." If a villager falls into the hands of his enemies he can look for severe treatment; "isolated dwellings and vehicles are plundered and burned, graves desecrated and grave-marks destroyed"—and then comes a bloody retaliation.¹⁹ In Borneo, each village is "instinctively conscious that it is a unit of a scattered people."²⁰

In East Greenland "the people of one settlement form, as it were, a society by themselves, which often is at enmity with the folk of another settlement" and a people on one side of a fjord will volunteer the information that those on the other side are bad men. "When we learned to know the natives better it appeared that it was very common for the one to disparage the other at the same time that he sought to place himself in the best light."²¹ Among the Central Eskimo, "every family is allowed to settle wherever it likes, visiting a strange tribe being the only exception. In such cases the newcomer has to undergo a ceremony which consists chiefly in a duel between a native of the place and himself. If he is defeated he runs the risk of being killed by those among whom he has come."²² By the Eskimo at Bering Straits, "stealing from people of the same village or tribe is regarded as wrong. . . . To steal from a stranger or from people of another tribe is not considered wrong so long as it does not bring trouble on the community."²³ This attitude, as we shall see, is abundantly paralleled throughout the world. "In general the Eskimo are extremely honest among themselves; but all consider it not only allowable, but even very praiseworthy to rob strangers. A clever robber of foreigners is an object of admiration, provided he does not let himself be caught."²⁴

The ethnocentrism of the American Indians is manifested in the tribal names, most of which, as applied by the tribes to themselves, mean "people" or "real people," and, as applied to outsiders, mean "earth-eaters" or something simi-

larly derogatory.²⁵ "Among the North-west Indians there has existed up to the most recent times a steady condition of war among the minor tribes."²⁶ "As soon as a Pawnee meets another Indian, a fight begins between them without further ceremony."²⁷ The Pimas captured Apache children and sold them to Mexicans and Spaniards. "These captives were well treated, but their origin was never forgotten and the fear and suspicion of the tribe found expression at times in the decrees of the medicine-men that certain misfortunes were caused by the presence of the aliens."²⁸ Among the Mohave, "not only sexual connection but ordinary intercourse with other races were regarded with disfavor, as being a specific cause of sickness."²⁹ For racial aloofness of this order the Seri Indians, a very primitive type, are noteworthy: "The strongest tribal characteristic is implacable animosity toward aliens, whether Indian or Caucasian; certainly for three and a half centuries, and probably for many more, the Seri have been almost constantly on the warpath against one alien group or another, and have successfully stayed Spanish, Mexican, and American invasion. In their estimation the brightest virtue is the shedding of alien blood, while the blackest crime in their calendar is alien conjugal union."³⁰

Among the Guiana Indians there is always some form of salutation, for the stranger is an enemy.³¹ The Brazilian Indians believe that all misfortunes come from outside, not least of which are sickness and death caused by foreign magicians.³² The Fuegians "dare not go where they have no friends, and where they are unknown, as they would most likely be soon killed. I have inquired of the natives if they think the Indians with whom we have not come in contact, would massacre a shipwrecked party; they unhesitatingly answer they would, on account of the following reasons:—1st—They would be afraid to let strangers live among them, they would distrust them; they would think the strangers whose language they could not understand had evil designs against them. 2nd—They would kill them in order to take undisputed possession of all they might have. 3rd—They know sufficiently well strangers to be jealous, and fearful of them; for they have heard of ships visiting their shores to steal their skins, ravish their wives, and do other deeds of violence. There are persons now living whose parents experienced such treatment, and there are several individuals over there, the descendants of these marriages. Thus through ignorance, covetousness, revenge, and distrust, they would certainly murder all foreigners indiscriminately."³³

The ancient civilized peoples were very clannish and drew a close distinction between themselves and outsiders, between the citizen and the stranger. Their patriotism was based on ethnic unity: exterminate enemies, help clansmen. Generations probably lived and died in the same corner of land, which was to them the best in the world. With their ethnocentrism went hatred of aliens.³⁴

§138. Causes of War.

WAR for plunder is the order of the day in Africa. In some parts, as in Central Africa where one of the chief motives for inter-village war is cannibalism, the booty may consist of human beings, a practice not uncommon in Melanesia also. More generally the objects of war are slaves and cattle. In East Africa the slave-trader is always waiting about the courts of the principal chiefs.¹ The chief causes of the inter-tribal conflicts of the Bageshu are theft or infringing upon the land of another clan.² The Bahima are a peaceable people and seldom make war upon other tribes, their chief object in life being to live quietly with their cattle; "nevertheless, they have ever to be on the defensive, for other tribes have always looked upon their vast herds of cattle with jealous eyes, and whenever the chance has presented itself they have pounced down upon, and tried to carry off one of the herds."³ As regards plunder, which is the main object of war among the Ba-Mbala, everyone takes what he can; there is no such thing as effective conquest, since they desire no territory.⁴ In Uganda, "after a successful raid the elders of the clan divide the spoil (which is, of course, cattle, sheep, and goats), and the warriors so far respect the old men that they allow them to take what they require from out of the loot, while at least seven of the captured cattle are sent to the medicine man. When this has been done, the rest of the loot in live-stock is left to be snatched at by the warriors. This proceeding results in a general *mêlée*, in which men sometimes get killed by spear or club wounds."⁵ Again, there are two types of war as distinguished by the natives. One is more like the European type, and is termed "call-out," for there is a declaration of war. One campaign generally completes the fighting, for the defeated rarely rally. Booty and slaves are taken, and the old and weak, as well as the chiefs, are killed. A second variety is mere plundering and stealing, arising out of ancestral feuds, with no definite cause. It is marked by treachery and surprise, and is carried on in great secrecy. Defenseless towns are attacked by night, and the result is slavery and great devastation. This type of war is common, especially at the beginning of the dry season, when the harvests are in and food is plenty."⁶ In Dahomi, "the chief end of the annual expedition is plunder, not conquest. Dahomi may be likened to a vast association of banditti, who at fixed periods . . . make raids upon their eastern neighbors, and return on the approach of the rains, laden with spoil." These raids supplied slaves, in the days of the European slave-trade.⁷ The wars of the Togo tribes "aim naturally, as in the case of almost all warlike negro tribes, only at the plundering of slaves, cattle, and other property from their neighbors."⁸

Among the Chukchi, "murder or infringement upon rights and property is punished by vendetta, but if the wrong is done within the limits of the family, outsiders have no right to interfere. Thus crimes against near kinsmen, which are by no means rare among the Chukchi, remain unavenged."⁹ The causes of war in the Sema country are said to be three in number—two being economic, while the third is evidently war for glory: "First, shortage of land necessitating

9 Bogoras, in AA, III, 107.

forcible encroachment on that of neighbouring villages; secondly, the protection of trading interests, as an attempt on the part of one village to trade directly with another at some distance has often caused war with an intervening village through which the trade used to pass (much to the profit of that intervening village) and which retaliates for its loss by making war on the interlopers, cutting up their trading parties, destroying the intercommunication between the offending villages, and compelling their trade to return to its old channel. . . . The third cause is found in the fits of restlessness that from time to time afflict most Naga villages, the desire of the young men as yet untried to prove their manhood and gain the right of wearing the warrior's gauntlets and boar's tusk collar, all culminating in an overwhelming desire to get somebody's head, which not infrequently outweighs all riper considerations of policy and prudence."¹⁰ Schwaner¹¹ mentions a war in Borneo, which had cost the lives of not less than one hundred and sixty men, and which arose over the abduction of a woman. It lasted on in the form of head-hunting for revenge a long time without the rest of the tribal-members seeming to feel that peace should be made. In New Zealand, "in later times the eating of the human flesh became the ruling desire and the chief incentive to war; this unnatural food was supposed to impart additional courage and ferocity to those who partook of it, and likewise to make their triumph over their enemies complete; nor must the love of plundering their foes, and despoiling them of their most valued property, their wives, highly-prized green stone . . . , jade ornaments, beautifully-wrought mats, carved weapons, stores of food, and women, be overlooked. All these circumstances combined to make war a delight, render the chief great, and destroy all feelings of compunction, if they ever had any."¹²

The Mohawk Indians, in the seventeenth century, descended annually upon the Algonquins near Manhattan to plunder or levy tribute.¹³ "In former days the Wabanaki (Eastern Algonkins) nation, the Indians called Meg'wek, or Mohawks, and other members of the Iroquoian Six Nations, were wont to wage bloody and unceasing war with one another. . . . The cause of the strife was an hereditary dispute about hunting grounds." And the Wabanaki tribes had feuds among themselves.¹⁴ The Apaches were spurred on to constantly renewed attacks upon the Pima "for the sake of the plunder that they might secure. Thus the feral pauper preyed upon the sedentary toiler, but paid dearly in blood for his occasional prize of grain or live stock."¹⁵ "The Hopi Indians, as their name indicates, are preëminently people of peace. . . . For many years, unaided, they waged an almost constant warfare with the predatory Utes, Apaches, and Navahos, who devastated their farms and approached even to the foothills of the mesas on which their villages stand. During the seventeenth, eighteenth, and the first half of the nineteenth centuries these hostilities were almost continuous."¹⁶ Here is a case of offensive warfare on the one side evoking necessary defensive operations on the part of a reluctant people—operations as indispensable to self-maintenance as the industry whose products tempted aggression.

"A pretty example of the rise of wars among nature-peoples" is as follows. "A whale was cast upon the coast of California, to the joy of the Indians who

16 Fewkes, in AA, IV, 482.

set themselves eagerly to cutting it up with their stone axes. When they were in the midst of this labor a hostile neighboring tribe appeared with the purpose of taking forcible possession of the whale." The latter withdrew when they saw that the Spaniards were going to take the part of the original finders.¹⁷ The directors of the Dutch West India Company reported that "the aforesaid company could not exist except by war."¹⁸ War among Brazilian natives is of a certain personal character when it is motivated in blood-vengeance. "But aside from that it is at present most often undertaken to get as booty slaves who are sold to other tribes or to settlers of Portuguese origin, or to free prisoners, or, more seldom, to drive the enemy out of hunting and fishing grounds."¹⁹ The chief motive of the reciprocal wars of the Orinoco Indians had for object the capturing of women and boys. "The original object of the capture was to insure, through the possession of captives, greater authority, a larger retinue, more laborers in their fields, and servants to wait on them"²⁰—a combination, it seems, of self-maintenance and self-gratification. The religious motive enforces the economic in a South American case where the deity orders a tribe to live by making war on all others, slaying men and taking goods and women.²¹

It is hardly necessary to cite the devotion of the ancient nations to plundering raids and piracy. Assyria was devoted to raiding, though commerce was beginning.²² In Homer cattle-raiding and piracy were reputable and even noble employments; Agamemnon wished he had been killed upon a cattle-raid rather than in the humiliating manner recorded.²³ The Ptolemies, having no ship-timber, warred on the Seleucidae for the cedars of Lebanon.²⁴ Carthage was "dives opum studiisque asperrima belli."²⁵ "Even in the writings of the most enlightened philosophers of Greece, war with barbarians is represented as a form of chase, and the simple desire of obtaining the barbarians as slaves was considered a sufficient reason for invading them."²⁶ In Arabia, "feuds are continual, but at little cost of life; the main object of a raid is booty, not slaughter; and the Bedouin, though a terrible braggart, has at heart little inclination for killing or being killed."²⁷ The Viking-raids of the Scandinavians were for booty and even for revenue; the Swedish king's men paid him a commutation if he stayed at home, and they kept all the rest of the loot.²⁸

War for woman-stealing, which is closely allied to self-maintenance, for glory, or for some religious reason, will be illustrated in the following instances. In Victoria, "all arrangements connected with marriage cause trouble in the tribes."²⁹ The general cause for war, in Australia, is "the death in the tribe of some man, from sickness or accident, which is invariably set down to the sorcery of some hostile or little-known tribe. In such cases, a party will set out after the burial, mad for bloodshed; march by night in the most stealthy manner, perhaps fifty or a hundred and fifty miles, into a country inhabited by tribes the very names of which they may be ignorant of. On discovering a party of such people, they will hide themselves, and then creep up to their camp

during the night, when the inmates are asleep, butcher the men and the children as they lie, and the women after further atrocities. If the party discovered be too large to slaughter wholesale, one or two will be disposed of by sudden onslaught, or likewise, and the invading party will quickly retire, to be followed in due course by warriors seeking their revenge. In *mêlées* of this sort it sometimes happens that a man or woman belonging to a tribe associated with the one whose members made the onslaught is killed in the darkness and confusion unrecognized, the result of which is further complications and bloodshed."³⁰ "Now and then they have inter-tribal quarrels and fights, but there is no such thing as the acquisition of fresh territory. No idea of this or of its advisability or otherwise ever enters the head of the Central Australian native. Very probably this is to be associated with the fundamental belief that his . . . ancestors occupied precisely the same country which he does now. The spirit parts of these ancestors are still there, and he has a vague kind of idea not only that the country is indubitably his by right of inheritance, but that it would be of no use to any one else, nor would any other people's country be good for him."³¹

Among some of the Melanesians, insults, wounded vanity, and jealousy were causes of war. "Boasting of success in love affairs, of which apparently a good deal went on among the young men at gatherings for feasts, and the jealousy thus aroused was another recognized source of minor warfare. . . . A brawl between members of a community arising over women or pigs might lead to wounding or killing." In other instances, long-standing feuds gave rise to warfare; "each hamlet-group appears to have had a traditional enemy with whom the greater part of its fighting was done, always in theory at least, to avenge the losses caused by its hostile neighbour." Cannibalism sometimes accompanied war.³² Twenty-seven causes of war are mentioned by a writer on the natives of southeastern Papua, which are classifiable under the four elemental motives of hunger, love, vanity, and ghost-fear. Women appear to be an especially common source of difficulty here.³³

The negroes of Gaboon war to get meat, but most often about women. Female chastity has a real money-value, but virtue is fragile. An adulterer flees to another village which cannot in honor give him up. Hence reclamations, discussions, palavers, and often war. In this country one village often gets the idea of destroying another. It has a member of a third village assassinated and lays it to the selected village-victim, offers alliance to the third, and the two carry out the program of destruction. A passion for thieving assists in keeping hostilities alive.³⁴ It is strongly characteristic of negroes, says Stuhlmann,³⁵ to determine on war from one day to the next, capriciously. The spread of Islam has heightened the destructiveness of tropical African war. While fetishists, the negroes have no idea of proselyting; they pillage but do not conquer, and their wars are like fires that die out. Once converted, proselytism just suits them, as the Koran gives so much booty into their hands.³⁶ Religion is conducive to warlike prowess among the Nigerian head-hunters, for the

36 Letourneau, *Guerre*, 63.

strongest on earth will be the strongest in the next world, and the spirit of a slaughtered enemy will attend the slayer.³⁷

The Kabyles have many pretexts for war, "but the real cause is always the same. The spirit of conquest not existing, and general interests not providing matter for discussion, the Kabyles fight among themselves only over questions of *amour propre*": real or pretended violations of public pledges or guarantees, abduction of women, private quarrels, and the like. "Every one fears to yield to his adversaries concessions interpretable in an unfavorable sense; they are obstinate, heads heat up, and war breaks out. The great majority of the combatants therefore have no really direct interest in the quarrels, and fight without hatred, through a spirit of solidarity and to satisfy a point of honor." The women upset their associative arrangements by awakening jealousies and by complaints to their husbands.³⁸

In the East Indies wars arise over the most trivial circumstances. The debt of one member of a tribe is demanded of his tribe; and if it is not paid, war results. A notice in the form of a warning is given, and if it is not heeded, war begins at once.³⁹ Head-hunting expeditions are motivated in religion as well as in the desire for trophies. "A further religious goad to war is the irksome mourning taboo after the death of a near relative or a chief, which cannot be lifted until a fresh head is obtained. The removal of the taboo by bringing home a head, described in song as a precious moment, and compared to a lump of gold, a lump of silver, and various favorite jungle fruits, is the occasion for one of their greatest festivals."⁴⁰ Veth⁴¹ says that an inflammatory literary production, such as Havelaar's *Multatuli*,⁴² could not have stirred up the Javanese, for they could not take it in; that the testimony of the past shows that every great exhibition of strength in the East Indies has always had cult-fanaticism at the bottom, as a lever. Once "the Sultan of Joló went to visit the Sultan of Mindanao, being escorted, for greater ostentation, by a squadron composed of sixty-seven craft. Seeing such a following, the Sultan of Mindanao . . . feared that it did not indicate peaceful intentions, and had the mouth of the river closed. At this the Sultan of Joló, being offended, challenged the Sultan of Mindanao to a personal combat. The challenge was accepted and the two sultans fought, 'body to body,' and with such rage that each killed his antagonist. Immediately war was kindled between the two peoples."⁴³

Vanity was an important cause of war in Polynesia. The natives of Samoa were ambitious to signalize themselves by the number of heads they could lay before the chiefs. "No hero at the Grecian games rejoiced more over his chaplet than did the Samoan glory in the distinction of having cut off a man's head." The *summum bonum* of a New Caledonian was to be praised as a great warrior.⁴⁴ The Polynesians also engaged in constant conflicts about trifles. An insulting word from one to another did not lead to a personal combat but a tribal one. Jealousy of a tribe prospering by peaceful labor was a frequent cause for war; and they fought a good deal over women.⁴⁵ But it was only at the outset

of the nineteenth century that the conquest-motive appeared, and Tamehameha, the "Hawaiian Napoleon," dominated the whole archipelago. A cause for war in New Zealand was the eating of a whale stranded on the shore of one chief's territory by members of a neighboring tribe.⁴⁶ "We fought for slaves and women," said a Maori chief once; "we did not want the land."⁴⁷

Among the Hurons and Iroquois, it was not the love of theft that led to war, but rather the desire for trophies. Murderers were pursued at once without ceremony. The violations of territory were a prime cause of hostilities. An Iroquois chief is reported to have asked a neighboring ruler to allow their young men to have a little war, in order to keep in practice. On the second chief's refusal, for he feared the consequences, he was asked with whom, then, "his children could play."⁴⁸ War-parties among the Omaha were of two classes—those organized for the purpose of securing spoils and those which had for their object the avenging of injuries. "The latter were held in higher esteem than the former, and the men who took part in them were regarded with more respect by the tribe."⁴⁹ Mason⁵⁰ reports that the Omaha wars were caused "by the stealing of horses, the elopement of women, and infringement on hunting grounds. . . . In aboriginal times war was occasioned by encroachments upon the standing order of things." The Passamaquoddy and Micmac tribes fought as a consequence of the quarrel of two lads, one the son of the Micmac chief, who was killed. The father would hear of nothing except vengeance, though the Passamaquoddy chief "even offered the life of his own son who had been guilty of the murder, but all to no purpose. In consequence of this unfortunate occurrence, the celebrated 'great war' was then declared, which lasted many years. . . . So great was the hostile spirit that the two tribes fought whenever they met, paying no heed to the time of year."⁵¹ The motive of revenge accounts for many Indian wars and their traditional cruelties.⁵² "The wars among the Indian tribes nearly always arise from individual murders. The killing of a tribesman by the members of another community concerns his whole people. If satisfaction is not promptly made, war follows, as a matter of course. When a neighboring people would neither join the confederacy nor enter into a treaty of alliance with it, the almost inevitable result would be a deadly war. Among the nomadic or unsettled Indian tribes, especially the Algonkins and Sioux, the young men are expected to display their bravery by taking scalps; and a race of farmers, hunters, and fishermen, like the Iroquois, would be tempting victims."⁵³ Among the Pima, any man of acknowledged courage might, with the approval of his fellows, organize a war-party. He received a title which lapsed, together with his authority, at the end of the campaign.⁵⁴

Between the different tribes in the regions inhabited by the Jibaros of Ecuador there exists almost perpetual enmity and destructive wars are often carried out, especially between neighboring tribes. Not seldom the feuds arise for the sake of the women. The Jibaros live in polygamy and hold their wives in high estimation. The men are very jealous of their wives and adultery is severely punished; the relatives of the woman frequently take her part and try to inflict revenge upon the husband. A much more important cause of war

is the belief in witchcraft, as when the sorcerer belongs to another tribe, and this superstition is the reason why they never aim at territorial conquests. The Jibaros "fear and detest the country of their enemies, where secret supernatural dangers may threaten them even after they have conquered their natural enemies. The sorcerers of the hostile tribe may have left their witching arrows everywhere, on the road, in the forest, in the houses, with the result that the invading enemies may be hit by them when they least expect it. The land of the enemy is therefore abandoned as soon as possible. Besides, the Jibaros, who inhabit endless virgin forests, where they can make new settlements almost anywhere, have no need of conquering the territory of other tribes."⁵⁵

The Aztecs warred to get captives as vicarious sacrifices for themselves and their children. What could give a greater sense of national power? They also had the motive of extending the boundaries of the empire.⁵⁶ "The wars of the Incas had an essentially religious character, and may be compared with those of the Mussulmans, at the time when Islamism, propagated by the sword, spread with such rapidity over whole regions." But the Incas also had conquest in mind. They are said to have warred without hatred or anger, to civilize the conquered; to have declared of one subjugated tribe that it was "not fit to be ruled by us," and to have withdrawn and abandoned it.⁵⁷ But these cases of conquest belong to a considerably developed civilization; "an expedition of conquest in and for itself witnesses already to a preceding high stage of development in the conquering people . . . a preceding amalgamation of many tribes into one well-ordered whole."⁵⁸ Wars to extend the cult or for conquest were common enough in the ancient monarchies of Assyria and Egypt.⁵⁹

Stealing of women led to war among the ancient Hebrews, and they were eager for pillage of all kinds.⁶⁰ The doctrine that the Hebrew god was the only deity was a prolific cause of conflict. The Arabs before Mahomet were given over to feuds which they could not solve and end.⁶¹ The Trojan War and the rape of the Sabine women are traditions of the woman-cause in wars; but Livy⁶² cites other causes of Sabine-Roman hostility. Letourneau⁶³ lists numbers of classical, Scandinavian, and mediæval points of dispute. The Germans of the time of Arminius were at continual war "propter raptas virgines aut arripiendas" (on account of maidens stolen or to be stolen).⁶⁴

§139. Warlikeness.

THE habitudes of the Australians afford one of the most characteristic pictures of a petty strife which hardly deserve the name of war. In their formal conflicts the casualties are very light, and they do not possess enough to tempt robbery. "Between tribes actually engaged in barter, peace, of course, prevails for the time; but it is no guarantee against sorcery, nor, as soon as business is concluded, against those murderous night attacks by which native warfare

is carried on." Tribes which are pretty well acquainted with one another may come into collision over some injury, such as murder, the refusal to give over a girl promised in marriage, abduction of a woman, or encroachment on hunting-grounds. "On such occasions the angered tribes meet to fight. The parties are drawn up in single file and open order, thirty or forty yards apart. The combat is principally with spears, which every man, his shield on his left arm, hurls straight, sharply, and horizontally, at the man opposite him. Spears which describe a curve in their flight are easily avoided. . . . I have witnessed combats of this sort more than once, and was struck by the novel effect produced by the straight, light, noiseless missiles passing in continuous, opposite, and horizontal streams. I wondered that so few persons could keep so many under way at once. It seemed to sleet spears. When the fight is in progress, there is very little noise. Very great agility is displayed in avoiding the spears and boomerangs, and the combatants have a very accurate perception of the flight of those weapons. For instance, I have seen a man lift his foot in the coolest manner to avoid a spear, which in effect plunged into the very spot on which his foot had rested. When one warrior has fallen, or several been obliged to retire disabled, hoarse shouts begin to be heard, and probably some pairs close with club and shield. Shortly a cry arises on both sides to part them; men, and perhaps women, interpose, and the combatants separate to look after the wounded. When one has been killed, both parties usually retire at once, and another battle may take place later. If nothing worse has happened than severe wounds, peace is made, and for a few nights the tribes corroborate in turn, one tribe being the performers and the other the spectators of the evening. . . . I should not think that a battle ever lasts more than half an hour. . . . No idea of conquest exists nor properly speaking of battle, for their fights do not lead to slaughter or spoils and are devoid of the ordinary consequences which follow battles and victories in civilized countries."¹

"Sometimes a fight takes the form of a tournament or friendly trial of skill in the use of the boomerang and shield. Ten or twelve warriors . . . are met by an equal number at a distance of about twenty paces. Each individual has a right to throw his boomerang at anyone on the other side, and steps out of the rank into the intervening space to do so. The opposite party take their turn, and so on alternately, until someone is hit, or all are satisfied. . . . Quarrels between tribes are sometimes settled by single combat between the chiefs, and the result is accepted as final . . . but real fighting seldom takes place, unless the women rouse the anger of the men and urge them to come to blows. Even then it rarely results in a general fight, but comes to single combats between warriors of each side. . . . The first wound ends the combat. This is often followed by an encounter between the women, who begin by scolding, and rouse each other to fury, tearing each other's hair, and striking one another with their yam-sticks."²

One of the reasons for the unwarlikeness of the Australians is that they have little worth fighting over. "It is property which principally makes men dependent on each other, being the main source of power, the main means of suppression; and it is the lack of it in the Australian race which renders its tribes so free and autonomic. There is nothing which might tempt them to suppress a strange tribe, nor do they possess anything to incite the conquering tendency in others. Thus we hear nowhere of fights for superiority. The seizure of women, a

¹ Curr, *Aust. Race*, I, 78, 84-85, 86.

² Dawson, *Aust. Aborig.*, 77.

murder here and there, very rarely a quarrel about some boundary, give rise to fights of a mostly harmless nature."³ There is no political organization within the tribe, but all are pretty much equal.

"A sudden death is often the cause of fighting amongst men of the bereaved tribe. They will exhibit their grief by spearing each other; and men have been killed at such times." A case is mentioned where a man died of heart disease and there was a quarrel over his grave. "The cause of the quarrel was not ascertained, but the results were fatal. One young man was killed, and he was buried in the very grave around which all had assembled for the purpose of paying respect to their dead relative. . . . Those who have lived amongst the blacks cannot fail to have observed that they are always expecting a fight. Distant tribes send messages to them relating to various matters, and other messages are returned, which are not always of a satisfactory character—anger and ill-will, at last, lead to an outbreak. . . . As a rule, fights are brought about by the misconduct of the women, the unauthorized killing of game, the sickness of some member of a tribe, the death of a prominent man, the quarrels of children of different families, or, not seldom, by trivial differences arising out of imaginary grievances. . . . But the combats between the fighting-men are not usually attended by very serious consequences. . . . Mr. Thomas states that of all the fights he has seen he has never known but one death to arise from their frays. He has seen desperate wounds inflicted very often, but none but one was mortal."⁴

Those who are inclined to see in these Australian customs an absence of war should not forget the bloody night-raids upon unsuspecting tribes that are motivated in fear of sorcery.

Of the Papuans in northeastern New Guinea it is reported that even the boys quarrel little and never come to blows, but that this is due to cowardice, and that cruelty to the weaker, especially to women, is a consistent trait, and one regarded as manly. A state of war exists between the tribes but emerges in no definite wars. They fall upon an enemy's country and lay it waste, but their courage does not extend to a real battle. No leaders can get obedience or persuade men to go on the warpath. The leaders are the rich, and they send out raiders for shell-money, who loot and burn villages. Peace can be got by payments of money. "It is seen that such wars afford profit only to chiefs lustful for *dewarra* [shell-money] and are therefore only chances for speculation for them."⁵ "Warfare, as we know it, is something incomprehensible to him. Here and there a man may distinguish himself by personal courage, in openly attacking his enemy and exposing himself to the risk of being speared; but it is not the Papuan method of fighting. He is an assassin, seldom a warrior. . . . This is in line with the cowardly methods the Papuan adopts in his warfare. He has no armies. He never ranges a force of men in front of a force of his enemy, and openly fights. I say never: I should rather say that when he does, there is remarkably small death-roll at the end of the battle."⁶

In another region in New Guinea war plays "no great rôle." Hagen⁷ could discover no big feuds or tribal wars. "Every village, every community knows its own strictly limited rights and duties, no one goes beyond his range, ambi-

tion and strenuosity are wholly lacking. . . . To this happy, easily satisfied people—whence should come war and feud? But yes, there is one cause, that great and universal one—woman, this enigmatic, sweet, terrible creature!" Krieger⁸ knows of a locality where weapons of attack are altogether lacking, and of several others where the people live in peace and content, untroubled by annoying neighbors and without cares for the future.

Some of the Melanesians divided warfare into two classes: neighborly warfare and warfare between enemies. In the first kind there was no cannibalism, the dead were buried either by their own people, or by those who killed them. "Fighting between enemies was a sterner affair, the dead would be eaten, and women could not save the wounded by throwing a grass petticoat over them as in fights between 'friends.'" There are also instances of ceremonial fighting as an accompaniment to marriage. Some writers maintain that some of these islanders became savage and repellent only after they had been habitually injured by Europeans.⁹

The Todas of India do not at the present time use any weapons, but they retain in their ceremonies weapons which were, no doubt, formerly in use, such as the club and the bow and arrow.¹⁰ Skeat and Blagden¹¹ give numerous instances of tribes in the Malay Peninsula which have little or no war. It is reported of one of these groups, the Sakai, that "thanks to their honesty, they can do without police"; they are a most peaceful race, kind and simple-hearted, "and now at all events never make war on each other or go in for any sort of inter-tribal fighting."

Among the Central Eskimo, duels are common between a stranger and a man of the tribe, sometimes resulting in the death of the former. Boas¹² thinks that real wars or fights between settlements have never happened, but that contests have been confined to single families. The last instance of a feud of which he knows had taken place seventy years before, that is, about 1815. "One tradition only refers to a real fight between the tribes." Around Bering Strait the Eskimo live in small groups and have no fighting weapons. They seem not to have understood what war means. The widely separated groups are so dispersed as to have no reason for conflict.¹³

Reclus¹⁴ attributes to their hard struggle with nature the disposition of the Aleuts to avoid all quarreling. If they cannot rest under wrong, they arrange for a public contest in abusive singing and acting directed at one another. Their children do not fight, but wrangle in words; this is less satisfactory, as the language is weak in vituperative possibilities. The people do not understand what war is. Father de la Rosa¹⁵ reports on certain aborigines of Colombia as follows. They are by nature peaceable, not using any arms, defensive or offensive. "Their fights and quarrels cause one to laugh, because their mode of avenging grievances one with the other is to go out to a place agreed upon, where there is a rock or great tree, each one carrying his cane (a black stick made of the heart of an elastic, lustrous wood), and then they strike ardently at the tree or rock, uttering a multitude of insulting words until one cracks or breaks his stick. To this one is accredited the victory, his enemy recognizing

him as the braver; and, embracing, they return to their homes, renewing friendship and drinking." The Tupis do not quarrel even when drunk.¹⁶

Of the aborigines of the Canary Islanders, it is reported that they "were fond of fighting above all things, with the single exception of the natives of Hierro, who knew no war, and had no weapons unless their long leaping-poles were used as such when occasion demanded."¹⁷

Warlikeness is a much more common trait than unwarlikeness. It is said of the Hottentots and other South African tribes that at the time of discovery "the natives were then by no means in a state of childlike innocence, and one could well understand, from the mighty scars and wounds, with which the bodies of most of them were covered, that they must have undergone frequent wars and raids."¹⁸ To the evidence given in the text of continual and serious hostility among both eastern and western blacks may be added instances of other peoples. Certain Tibetans are always at war, tribe against tribe, generally upon the most trivial pretexts. Two men may quarrel over a knife, and the aggrieved party returns and reports the case to his chief. "His right to the article in question is never considered; it is enough that he should have quarreled over it. War is immediately declared on the tribe of his rival;" it is carried on with ferocity and perhaps for years. In northeastern India, "the condition of some of the tribes may be seen in the facts that the Angami villages were practically strongly posted hill stockades; and that in the villages of North Kachar, during the night a watch was kept and the streets were regularly patrolled; and that among the Eastern Nagas in 1873 every village was constantly prepared against surprise, parties of men keeping continual watch and ward over the village gate-ways."¹⁹

The dominant and aggressive Sea Dyak is "a ruthless destroyer of tribes, which, owing to an inherent and fatal weakness, are already tottering to the verge of extinction."²⁰ The Aru Islanders "are rarely without fighting somewhere. Individual quarrels are taken up by villages and tribes, and the non-payment of the stipulated price for a wife is one of the most frequent causes of bitterness and bloodshed."²¹ In Timorlaut there are incessant intertribal fights and no one dares go beyond the palisades without spear and bow.²² "All of Nauru is a scene of war," even boys carrying weapons. Feuds arising out of trade are common.²³ When Turner²⁴ first visited the Loyalty Islands, in 1845, "a chronic state of war prevailed, and each island was divided into two parties. . . . Kidnapping from one another was common. These and others who fell in battle were dressed for the oven. They were inveterate cannibals." The Tannese lived in a state of perpetual war. They were fighting during five out of the seven months that Turner lived among them. "There is ample proof there," he states, "that war is the enemy of civilisation and the element of savage life. We were never able to extend our journeys above four miles from our dwelling at Port Resolution. At such distances we came to boundaries which were never passed, and beyond which the people spoke a different dialect. At one of these boundaries actual war would be going on; at another,

kidnapping and cooking each other; and at another, all might be peace; but, by mutual consent, they had no dealings with each other." The natives of New Caledonia thought they were more numerous now than formerly. "They accounted for it by there being less war now than formerly. Still, it was war, war, war, incessant war! They said that formerly they did not stop a fight until one party was killed right out to the verge of extinction, but that now they are more merciful." Raid and foray, massacre and pillage, were the order of the day in New Zealand and did not cease until the whites came. Many a Maori took to Christianity when the missionaries read to them an account of "a rattling good hip-and-thigh combat, in which the Israelites slew their thousands."²⁵

The Pima Indians "kept themselves constantly in fit condition by their campaigns, and even engaged in sham battles for the practice. . . . Their daily duties were ordered with reference to the possibility of attack. Their arts were modified by the perpetual menace. Their myths were developed and their religion tinged by the same stress. In short, the Pimas were building up a war cult that in time might have led them from the lethargic state in which the natural environment tended to fix them." That many of the American tribes ordered their lives with warfare constantly in view is too well known to need much illustration. The injunctions given to the Pima boy might have been impressed upon any Indian youth. "If you are wounded in battle," said the father, "don't make a great outcry about it like a child. Pull out the arrow and slip away; or, if hard stricken, die with a silent throat. Go on the war trail with a small blanket. It is light and protection enough for one aided by the magicians. Inure yourself to the cold while yet a boy. Fight not at all with your comrades; preserve your strength for the combat with the Apaches. Then, if brave, will come to you high honor. Be unselfish or you will not be welcome at the fire of the friendly. The selfish man is lonely and his untended fire dies. Keep your peace when a foolish man addresses the people. Join not in his imprudent councilings. Above all, talk not foolishly yourself. Bathe in the cold water of the early morning, that you may be prepared for the purification ceremony after killing an enemy."²⁶

One South American tribe believes that their deity has bidden them live by making war on others, taking their property and wives and killing their men.²⁷ A certain Brazilian tribe regards it as a natural duty to kill the members of a neighboring weak people, preserving the victims' heads as trophies. Almost every tribe has its open tribal enemy. There are tacit alliances for defense and offense. Another tribe, that specializes in plundering and killing, uses even its women in war; and the attack of the warriors is seconded, "with indescribable fury," by their large and strong dogs. The Indian "lives and thinks under the impression: *bellum omnium contra omnes*."²⁸ The Botocudos are in constant war with neighboring peoples.²⁹ In Paraguay there are "bloody fist-fights between men, women, and children" to let off their surplus pugnacity.³⁰ Darwin³¹ wrote of the Fuegians: "The different tribes have no government or chief, yet each is surrounded by other hostile tribes, speaking

different dialects, and separated from each other only by a deserted border or neutral territory;" and again, "I do not know anything which shows more clearly the hostile state of the different tribes than these wide borders or neutral tracts. Although Jemmy Button [a native the voyagers had with them] well knew the force of our party, he was at first unwilling to land amidst the hostile tribe nearest to his own." Among the Araucanians armed raids were constantly made on the neighboring villages, and thus a continual state of warfare was kept up. Latham³² thinks that to the abundance of comestibles is to be ascribed the warlike tendencies of these Indians, "who not having to give much heed to their food supply, the fertile soil producing it spontaneously almost everywhere, could indulge freely in the luxury of continual warfare. This also gave them an enormous advantage over the Spaniards in their long campaigns, as the latter were almost entirely dependent on their baggage trains or provision supplies, while the surrounding country catered to the wants of their indomitable foes."

This state of constant war is found also where a former political aggregation has broken up. It is a sort of reversion to primitive chaos. Junker³³ calls the splitting up of tribes "the real deadly enemy of all negroes. . . . The feeling of solidarity includes only the members of a branch-tribe or sub-tribe; but they get into feuds over some trivial cause such as a runaway cow or the like, and must in the end come into subjection to a common foe whom, if united, they could successfully withstand—especially if that enemy . . . knows how to stir up one tribe against another and to cause the negroes themselves to take care of the work of annihilation." The disintegration of the Niam-Niam people into little principalities had continuous hostilities and wars as a consequence. "No prince left his land any more by reason of eternal suspicion of the rulers of neighboring districts." Similar dissolutions of empires on higher stages of civilization have resulted in similar periods of violence.

§140. War-USages.

IN a savage society there was at least this advantage, that the whole male strength of the community—and sometimes the female as well—could take the field when necessary, fully equipped at short notice for defense and offense. There was no calling for volunteers, no hasty drilling of recruits, no trouble with slackers. This, thinks Cowan¹ was the natural outcome of the communal system, the gradual evolution of the family into the tribe, which was really only the family on a larger scale. The organization of the war-party was naturally rudimentary and the usual tactics were ambush and surprise. A number of the cases in the immediately preceding sections illustrate the present topic.

The customary method of fighting among the Melanesians was the night-attack. "In this, a village was, as nearly as possible, surrounded quietly during the hours of darkness, and the attack made at dawn; if all went well for the attacking party, they killed the majority of the inhabitants regardless of age and sex, and looted and perhaps burnt the village."² Some of the Papuan tribes were taught to paddle their war-canoes in one way only—bows on, the bow of a canoe being dedicated to war and the stern to peace. "They were

32 In JAI, XXXIX, 341, 354.

33 *Afrika*, I, 337; II, 189.

1 *Maoris*, 223.

2 Seligmann, *Melanesians*, 121.

thus taught not to jump up and turn round to paddle away from the enemy, but to steer straight for the opposing canoes. Canoes of any size were never brought on to our beach bows first, as it would have meant war." The boys among these people were encouraged to use small spears against any person, even their mothers, on the slightest provocation.³ The aid of the supernatural is often sought by the Melanesians; the following case illustrates admirably how, among the Fijians, a religious theory may be criticism-proof. For days before a fight the warriors would steadily prepare themselves by songs and chants in honor of their war-god, the deity being held to enter into a selected stone taken from the larger water-worn pebbles of a running stream. "At length one man would exclaim that the demon had entered into him, and that he was now invulnerable; no weapon formed against him should prosper, the battle-axe would bound back from his toughened skin, the musket bullet would flatten against his body, and the spear-point glance harmlessly aside." Webb⁴ continues: "I pointed out a young man with a gunshot wound through the neck, who, a few days before, had been in the invulnerable condition, and asked how they accounted for his hurt. 'He had broken the *tapu*, and eaten bananas,' was the reply. Another warrior limped past, with a hole in his thigh. 'He had connection with a woman just before the fight,' they explained, 'and that destroyed the charm.' These people are full of explanations as to failures."

The manner of fighting among some East African tribes was never very desperate; "they were women in war, but very dangerous in thick bush; but among themselves warfare seems to have consisted largely of much rushing about and shouting until one side or the other was terrified and ran away. This also is told by a missionary who witnessed such warfare in former times. Natives have told me that certain people had medicine which they smeared between their thumb and forefinger, the merit of which was that it made it impossible for them to err in their aim, and that such people were often not allowed to go to war because of the destruction that they did. This somewhat comic view of warfare shows that the object of the fighting was not so much the destruction of the enemy, but when, despite this, it is certain that numbers were killed, this is only to be explained by the fact that the fighting went on continuously."⁵ A fight among the Ba-Yaka is usually prefaced by mutual oburgation, but ambushes and night-attacks on villages are common, and indeed, form an essential part of native tactics; consequently in war-time sentries are posted in the grass around a village.⁶ The Akamba custom is to attack at night; "they would march under cover of darkness to within striking distance of the place of attack and there rest until between four and five a.m. so that after the attack was delivered it would be about sunrise and they could see to collect the captured live-stock."⁷ One can hardly dignify the quarrels and fights among some of the Congo tribes with the name of war; there was no army and no organization, but all the men and lads took part in the fight that affected their family or their town. The fighting was simply an affray, a *mêlée*, in which there was no order and no words of command.⁸ Much more developed was the war-organization of the Baganda, where, at the drum-call, all rush to

their immediate superiors—chiefs or earls—and these to the higher chiefs, and then to the king, considerable speed being shown in mobilizing. There is no commissariat, the soldiers being dependent on each day's loot for their food. All weapons are "medicined" before war, to make them more effective.⁹

This religious element in primitive war-preparation is seen in other African examples also. Before the Bahima king consents to the commencement of hostilities, he sends to consult his ancestors as to the advisability of undertaking the war and the prospects of its success; "a special messenger goes to the forest with a suitable present of cattle, the priest receives the messenger and, after offering some of the cattle to the sacred lions, he proceeds to consult the ghosts, giving special heed to the ghost of the king's father. If the answer is satisfactory the king chooses a general who collects his army by sending messengers to the leading chiefs in the country. The army consists, in almost all cases, of volunteers, each man brings his own weapons, and is responsible for his own food."¹⁰ The Lumbwa raiders set forth amidst a complexity of omens and prohibitions: no sexual connection may take place on a raid; to meet soldier-ants when marching at night betokens a retreat at once.¹¹ Before a war is decided upon, among the Nigerian head-hunters, the elders and priests repair to the sacred grove and ask the opinion of the spirits. This is usually favorable, and then a leader is appointed who is chosen for his skill in arms. Among these people there is a very close connection between the hunting- and the war-parties; "a chase may easily be turned into a battle, even amongst the hunters themselves, when the arms for both are the same, and the search for beasts may become a hunt for men."¹²

The Chinese have had many bloody wars concerning the result of which on population the term "decimation" in its root-meaning is all too feeble. One case shows seven-ninths of the population destroyed by war.¹³ Sudden raids, surprises, ambushes, and hurried evasion are among the Sema Nagas' methods of warfare and head-hunting; the pitched battle does not often occur. If the raiders find their prospective victims prepared, they come home rather ignominiously.¹⁴ The Samoans in action never stood up in orderly ranks to rush at each other; according to their notions that would be the height of folly. "Their favourite tactics were rather of the surprise and bush-skirmishing order." Prayers over, arms ready, and equipped with their relic charms, the New Caledonians went off to battle.¹⁵ From his early years every Maori was trained in the use of the spear, and later the gun of the white man; he learned, too, the various charms and spells and invocations that gave *mana* to his weapon and "more power to his elbow." On the war-path his commissariat did not trouble him overmuch; "he needed no waggon-loads of 'bully-beef' and hard biscuit; was not his enemy's own body to provide the rations?"¹⁶

War was at one time the chief occupation of the Tlinkits, and treachery was regarded as a lawful means by which to entrap enemies: "surprise, cunning, treachery and ambush entered more into their warfare than open valour."¹⁷ The acquisition of the horse and of the firearms of the whites greatly changed the Indian methods of warfare, and among the Plains Tribes the introduction

of the horse furnished a strong motive for war—to capture something of great value. There were many ceremonies before setting out on the warpath, and failure to observe some law or custom would force the party to turn back.¹⁸ Dreams sometimes influenced the acts of a war-party, and instances have been known where, because of a dream, the entire party has disbanded and returned home.¹⁹ Some tribes wore arm-bands to which were attached metal jinglers, the sound of which was thought to be efficacious to lull the slumbering enemy.²⁰ Aggressive warfare was pretty generally under the control of rites, and the war leader who failed to get the sanction of the spirits was punished.²¹

When the Jibaro warrior of Ecuador prepares for an attack against an enemy he wears around his neck a necklace of jaguar's teeth and around his waist the usual cincture of human hair. Old warriors, however, for an attack prefer to gird themselves with a broad belt of skin of the great boa. The object of these paraphernalia is to impart strength and valor to the warrior. "The teeth of the jaguar and the belt of the boa skin naturally give the wearer something of the demoniac strength of these animals. Again, the power which the Jibaros attribute to the cincture made of human hair depends on the supernatural properties ascribed to the hair, which is regarded as the seat of the soul or the vital energy." After the preparations are made and the party sets out, there is to be seen the disciplinary effect of war. "The warriors march from the house of the chief in a single row, going one after the other, and strictly observing silence. The chief goes out last and shuts the door. During the whole journey to the scene of the war, a journey that takes several days, sometimes even weeks, the warriors are allowed to speak only when necessary, and even then not in a loud voice but in a whisper. Only the chief has the right to speak in a loud voice when at the camping places he gives his men the necessary instructions."²² At the time of the Spanish invasion it was the Araucanian custom to march in disorderly bodies without any attempt at formation; later, "experience taught them to organise their methods better, and a stricter discipline was established and bodies of scouts thrown out in advance. But no discipline was of avail when some superstitious incident occurred upon the march, if such were considered inauspicious. The army immediately broke up and returned to camp. All discipline was lost, too, at the moment that booty presented itself. Then it became each one for himself."²³

The Military Services of Women. In English New Guinea, the women "sometimes take part even in the councils of the men; and I saw girls armed with clubs in a fight, and active among the first ranks of the fighters." In one district there was even a female leader.²⁴ In another district, "women always follow to the fight, and they kill outright with their sticks any who may be severely wounded. The women also do the looting. The men say they are a great encouragement to them, as they urge them on; and they also create a feeling that they must be protected. The women themselves like it."²⁵ The women of the Marshall Islands "take part in sea-voyages as well as in war."²⁶ It is

reported of the African Pygmies that "the women are on an equality with the men and go hunting with them, and accompany them to the wars, taking their part in the combat." The result of this is that these tribes "are looked down upon by all the other tribes, and not being regarded as a warlike people, are hunted by the surrounding cannibals, to be cooked and eaten. They are a lower type than the others, and both men and women are shorter and differ also in color from the rest."²⁷ The women as well as the men, among another Pygmy group, in Angola, carry bows and arrows.²⁸ Among the Ba-Huana, the chief instigators of war are the women; "if the men are peaceably inclined and rather disposed to pocket an insult, the women make fun of them: 'You are afraid, you are not men, we will have no more intercourse with you!'" Then out go the men and fight.²⁹

All authorities of the thirteenth century agree that Mongol women went into war with men, were fine archers, and fought as well as the men.³⁰ Says Schwaner³¹ of a Bornean tribe: "They concede large freedom and rights to their women, who not seldom rule in the house and over whole tribes with the power of men, encourage to war-expeditions and in the war itself lead the combatant men." In Celebes "all full-grown persons, women as well as men, must practice the use of weapons."³² Some of the Malay tribes have a tradition of a race of gigantic women or Amazons, who remain unmarried.³³

In Samoa the young women took part in war; they had the task of decapitating the fallen enemy.³⁴ In Ponapé, when required, the women accompany their husbands and relations fearlessly into the battle.³⁵ In the fights of the Gilbert Islanders, the women not seldom take an active part; a missionary, in 1858, found the corpses of six women on one of their battle-fields.³⁶ The Maori women often accompanied their lords to war; they could fight as well as the men if need be. "The Maori *wahine* could be a horribly savage Amazon when on the war-path in ancient days."³⁷

Of the American Indians it is said: "In defensive warfare the warriors sprang to the alarm and aimed to engage the enemy beyond the limits of the village, while the women hastily threw up breastworks or dug pits in which to thrust the children out of reach of flying arrows. Women fought only at close range, using their knives or any available object as weapons; but in rare cases women went to war and fought on equal terms with the men of the party."³⁸ The chief of one Brazilian tribe, which exhibits a well developed military organization, is surrounded by a number of women who with dexterity seek to parry the weapons thrown at him.³⁹ In Brazil there exist a number of tales of tribes of female warriors.⁴⁰ If one side has to retire, in a battle among the Guiana Indians, "they seek their dead before anything else to prevent them falling into the hands of the enemy, a business which the women have to see to, they following the men like pack animals."⁴¹

Von Götzen⁴² mentions a "highly original body-guard," consisting of ten

well-built girls, each carrying a gun of a different construction, mostly breech-loaders in a useless condition. The author states that the army which a certain chief brought over to help the Belgians, in their war with the Arabs on the Upper Congo in 1892, consisted of nine thousand, of whom three thousand five hundred were women; whether they all were combatants is not stated, but three hundred females, some of whom were armed with guns, formed a body-guard for the leader. The Sultan of Atjeh, in the early part of the sixteenth century, had extirpated all the ancient nobility and murdered all the princes of the blood; he then feared assassination and surrounded himself with a body-guard of women.⁴³ The familiar legend of the Amazons does not need to be rehearsed here. Certain tribes of the Don region are reputed by ancient authorities to have been in subjection to their women, who were just as warlike as the men. They are connected by Pliny⁴⁴ with the mythical Amazons. Eden's "First Three English Books"⁴⁵ contains references to Amazonian peoples. In an abridgment of the mediæval legend of Prester John, the story goes that there are three Amazon queens, who, when they go to war, have each three hundred thousand women, beside other women to carry food. These women are manlike in fighting, and very hardy. No men may come into this land except nine days in the year, during which period "the women have conversation with them, and no more in the year." This account about Amazons goes on to relate how Columbus, on his second voyage, came to an island which his captives told him was inhabited only by women, to whom the cannibals had access at certain times of the year. The male children were sent to their fathers, but the girls were retained. These women lived in caves or dens in the ground, and defended themselves with bows and arrows against any men who invaded the island. Some rationalization of the legend is attempted, namely, that the women are wives of very warlike cannibals and that when the men go away to hunt human prey, they defend the island against invasion. In Scandinavian graves are found female skeletons with bronze daggers. These women, probably battle-companions of their husbands, might have been the originals of the Valkyrs.⁴⁶

Other services which women perform in war—notably the carrying of provisions, stimulating the men to action, and acting as intermediaries, their persons being then inviolable—are indicated in the following cases.

"In peace, even amongst the bitterest enemies, nobody attempts the life of a Somal woman; nor is the woman an object of blood-vengeance. Only in war do enemies seek out pregnant women," in order to destroy the unborn.⁴⁷ Among the Kabyles, "the women do not remain inactive during war. They cast bullets, make cartridges, and prepare provisions. Often they appear on the battle-field . . . their cries mingling with the noise of explosions and their warlike songs exciting the ardor of the combatants to a delirium." They are commonly under safe conduct and can circulate freely from village to village; and their presence confers immunity to fugitives. "If they discover, in the morning, an ambuscade about the village, the enemy retires, and their withdrawal must not be disturbed. In the midst of this society, which is rude to the limit of ferocity, woman carries, in the folds of her garments, pity and sympathy."⁴⁸

Among one of the tribes of India, "if a virgin enterprise is to be inaugurated, it is *sine qua non* among them that no woman should know a word about the matter." On the contrary, when open hostilities have commenced with some other clan, the women accompany the warriors an hour's journey, carrying their provisions, and leaving them with a blessing and wish for success."⁴⁹ Among certain Indians the women were wont to run between the fighters and by continued cries urge them to stand fast.⁵⁰

"The Arabs of former times, when they believed that victory could not be won without extreme effort, used to set the most beautiful girl of the tribe . . . upon a richly caparisoned camel and lead her into the battle." Before the beginning of the fight, such a woman, where possible one of the noblest rank, dressed as a bride, unveiled, and with loosened hair, and bare neck, rode up to the first ranks to solicit the promise of the elite of the army, the youth of the tribe, to win or to die. Then the girl moved on against the enemy and the battle began. To her capture and defense were directed the strenuous efforts of both parties. "Not seldom did the whole young manhood of the tribe perish."⁵¹

Just because the Arab house afforded protection against blood-vengeance, did the wife play in it a special rôle. She was herself sacrosanct in the blood-feud, and as the house-mistress she was the recourse of those who sought asylum.⁵² It was not so far from this position to that of arbitrator of strifes. The Scandinavians had the "woman-peace," both in war and in family feuds; according to German laws, women were inviolate both as to person and to property. When peace was made, noble virgins were given as hostages. Injury to a woman was punished with double or triple penalty.⁵³

§141. Rules of War.

Declaration of War. An important instance of the mitigation of war, and one which arose quite early, is the declaration of hostilities. The effect of this is, obviously, to give the enemy a chance, and it represents a sort of chivalrous action in contrast with the more usual primitive method of ambush and surprise. Letourneau¹ cites a number of cases of the declaration of war. In clan-wars the Masai allow no surprises or sudden attacks. The place of conflict is appointed and the whole population camps out there while the battle is fought by champions. The victors get an unquestioned claim to the cattle involved. This is quite different from the procedure in wars with aliens. The Kabyles declare war; no one may commence without warning, otherwise every death is regarded as an assassination demanding retaliation—a blood-debt; but they seize cattle and occupy the best positions beforehand. The wounded and prisoners are killed only under exasperation. Mohammedanism confirmed the habitude of declaration. The Hurons and Iroquois declared war by delivering a tomahawk whose handle was painted black and red. The Iroquois, however, waited a year after "digging up the hatchet" so that it might not be known when the blow was to fall. In Florida war was declared by planting in enemy

territory arrows with a small piece of cotton or wool attached. Few tribes are like the Tenae of India who declare war, attack openly, and respect non-combatants.

To Letourneau's collection, of which the above are samples, a few may be added. In New Guinea, the declaration is sometimes the sending of a broken spear. Heralds or messengers are used elsewhere.² Declaration in West Africa, after the killing, accidental or not, of a villager, is by washing the hands in a brook. Then comes the "palaver."³ A sort of warning occurred where there were, "close on the path, and in full view of every passenger, three objects suspended from the branch of a tree, viz., an ear of maize, the feather of a fowl, and an arrow. The guides explained these as meaning that whoever touched an ear of maize or laid his grasp upon a single fowl would assuredly be a victim of the arrow."⁴ Again, war is declared by sending hatchets or picks, and peace by recalling them. Women are sent to get them, being employed, here as elsewhere in equatorial Africa, as go-betweens to do the parleying.⁵ The Maoris sometimes launch a light spear at the enemy as a challenge to war;⁶ while among the Guiana Indians the throwing of an arrow served the twofold purpose of a call to arms and a declaration of war.⁷ Though the Ecuador Indians usually carried out the plan of attack in greatest secrecy, the victim was sometimes threatened beforehand.⁸

Less formal warnings of hostility are to be met with. Of some tribes in New Guinea it is the custom "that if the loin-cloth which a man wears, made of the bark of trees, be wound tightly around him, all is well and you may safely approach him; but should it be hanging down from behind, then beware, for he is in fighting trim and is on the war-path and sharpening his cannibal teeth preparatory to a feast."⁹ Again, where wild ginger is chewed, "to give a piece to another person signifies 'war' against him: and for this reason it was some time before the writer could induce the natives to eat any ginger-bread biscuits."¹⁰ Amongst the Slave Coast negroes it is a sign of enmity and rancor to refuse a gift.¹¹

Sometimes the destructiveness of war is limited by inability rather than unwillingness to destroy. In Melanesia the natives cut down each other's trees, but since their axes, often of shell, are poor, not much damage is done.¹² There is, as in Homer, a sentiment that the proper thing is to fight with the spear rather than, at longer distance, with the bow.¹³ "Sometimes one tribe will challenge another, and a place of meeting is arranged. The hostile tribes arrange themselves in two lines facing one another, with an interval of about a hundred yards between. . . . The contest is of short duration, as a man or two wounded on one side is considered sufficient excuse for that side to run away."¹⁴ Again, the warfare may be one of words or even gestures rather than of bloodshed. An odd case is that of the Rengmahs, who "wear a peculiar tail. It is of wood, about a foot and a half long, curved upwards,

broad at the base and tapering to the tip. Rows of white seeds are fastened longitudinally on it, and from it hang long tufts of scarlet and black hair. The broad part is fitted to the small of the back, and is suspended from the shoulders by a prettily embroidered belt (red, white, and black); a small cloth tied around the waist secures the tail. This tail is used in a fight to signify defiance. They turn it toward the enemy and by hopping around rapidly on each leg impart a defiant wag. 'Turning tail' with them means the opposite of what it does with us."¹⁵ Where this sort of device is worn the fighting cannot be very serious. In the less fierce quarrels "the hostile parties confine themselves by mutual agreement to certain fixed bounds within which they might kill each other; in these milder quarrels the women and children are not injured. . . . It is noticeable that in these intestine wars the women of the contending parties visit each other at their different villages without fear of molestation. But when at war with other tribes, their attacks are treacherous, and they spare neither sex nor age."¹⁶

The Siouans had no standing armies and no general who held office for life or for a given term. There was no militia. "Military service was voluntary in all cases, from the private to the commanders, and the war party was disbanded as soon as home was reached. They had no wars of long duration, in fact, wars between one Indian tribe and another seldom occurred, but there were occasional battles. This was for want of transport and compact food."¹⁷ "Battles would often go on for the greater part of a day without the loss of more than one or two men on each side. At last one party, becoming discouraged, would break and run."¹⁸ The Fuegians "fight with clubs, spears, stones and slings; of course many are wounded, but seldom any are killed."¹⁹

The use of champions to decide the conflict operates further to check the destructiveness of war. There are instances of single combat running from the Eskimo and Melanesians to the ancient Hebrews.²⁰ Another check on war is the regulated combat, in which all the teeth, so to speak, are taken out of the struggle.²¹ One instance, reported from the Caroline Islands, may be cited in full, in which there are firmly fixed formalities connected with the prosecution of war. "If the inhabitants of the West Islands have been injured by their easterly neighbors, or think they have been, they communicate with their adversaries through a properly accredited messenger to the effect that in five days from that time (they always choose the five-day interval) at such and such a time, in such and such a place, such and such a number of warriors, armed and fitted out in a certain manner, in a certain number of canoes, will land in order to join negotiations at the above place concerning the explanations due and the satisfaction demanded. Landing, conference, and negotiation all take place. If the affair is settled in a friendly way, it ends with a feast and both parties hold themselves to be satisfied. But if they cannot come to agreement, they take recourse to weapons. A number of warriors equal to the number of those presenting the complaint measure themselves with these, and the right of the stronger decides. For a half hour they fight like mad tigers and deal out wounds and death without mercy; then they

separate as if upon prearrangement and rest the remainder of the day. Both parties remain in the neighborhood of the battle-ground to bury their dead and take care of their wounded. On the next day, as soon as both parties have declared that they are ready, the battle begins with renewed violence and again lasts as long as it did the day before, unless one party retreats and declares itself beaten. Otherwise they separate again after an hour of embittered strife, lay aside their weapons and help each other, on both sides, to bury the dead and bind up the wounded. On the third day the conflict is decided. It begins in the morning and is continued until one party succumbs. If this happens to the aggressors, they turn over their canoes and weapons to the victors, who give the vanquished a feast and must convey them in safety to their islands, where the peace is sealed by a new two-day feast. Both sides then mourn fourteen days in honor of their friends who have been killed in the battle. Then friendly relations are again renewed and the members of both tribes come and go to each other as before. If, on the other hand, the aggressors are the victors, then the others grant their demands and make as favorable a pact as circumstances allow. It is always solemnized by a two-day feast. Prisoners captured during the fight belong to those who have seized them, if their party wins the victory; otherwise they are given back to the victors. The men of the defeated party are never regarded as captives, but honorably treated and convoyed back to their home.²²

Poisoned Weapons. The practice of poisoning weapons was at one time widespread. It survives now only in the sub-tropic zones, as witness the following cases in illustration. The suppression of the use of poison was probably brought about by social influences sanctioned by the cult.²³ The most common primitive weapons to be poisoned are the arrow used with the bow and the dart of the blow-gun.²⁴

The Australians have no plant-poison, and employ the products of putrefaction.²⁵ It is stated that the arrow and spear are not poisoned anywhere in New Guinea; but that such means are employed in several places in Melanesia and perhaps about Torres Straits.²⁶ The African Bushmen have an arrow whose poisoned point comes off in the game, and they have carried the weapon over into war; the Hottentots, though more civilized, use poison.²⁷ Other South African tribes do the same, and there is a good deal of this sort of thing farther north, generally among the more backward tribes.²⁸ To an East

African "it is best to be cunning and deceitful; his weapons, the bow and poisoned arrow, are typical of such a character." The poison used in this section is extremely virulent; when fresh it is said to kill a man almost instantaneously.²⁹ Stuhlmann³⁰ says the Pygmies use poisoned arrows, but this is stated by Burrows³¹ to be a "gross libel" upon that people.

Poisoned arrows are reported in ancient India,³² Kamtchatka,³³ and Malacca; in the latter case, the poison is partly animal matter, from poisonous insects, reptiles, and fish.³⁴ The use of poisoned darts in blow-guns is common to a number of Malays, as is also the practice of placing poisoned splints in a path or in the shallow bed of a stream.³⁵ The Indians of the West used on an enemy an arrow, "generally poisoned, and with long flukes or barbs, which are designed to hang the blade in the wound after the shaft is withdrawn, in which they are but slightly glued," while the hunting-arrow is firmly fixed in the staff and the flukes inverted so as to be drawn out readily.³⁶ Some of the Apache poisoned their arrows "by dipping them in decomposed liver, to which had been added crushed tarantulas, scorpions, and often the venom of rattlesnakes. . . . The Menomini admit that their ancestors poisoned their arrows by besmearing the points with rattlesnake venom." Several other North American tribes are reported to have poisoned their arrows.³⁷ South Americans poison arrows other than those used in the blow-gun.³⁸ A certain Colombia tribe fears to put the poison on the arrow-point, lest its strength cause the metal to lose its temper, or lest it be weakened by the metal, and so they smear it in the binding. The only danger is contact with the thread used to fasten on the tip. "Arrows that are tipped with a shark's tooth, or hardwood worked into a point, are the worst because these they make without fear of loss, and saturate them with poison."³⁹ An Amazonian tribe, which "delights in war," uses an unfeathered arrow with poisoned head, notched and half cut through, so as to break off in the body.⁴⁰ The Araucanians poisoned their arrows, carrying the venom in small stone or earthenware jars and smearing it on the arrow-tips immediately before use. The Spaniards applied salt to the wound as an antidote.⁴¹

"Metal arrow-heads, especially those of bronze, like the bone missiles and sling weapons of the palæolithic age, frequently display arrangements for the reception of poison."⁴² Hercules is figured as shooting Nessus with a poisoned arrow.⁴³ Poisoned swords are mentioned in the epics of the North.⁴⁴ The

Bretons are said to have used poisoned weapons in Druid times,⁴⁵ and the ancient Slavs are aligned with them.⁴⁶ European peoples could be found using poisoned arrows up to the seventeenth century.⁴⁷

Treatment of Prisoners and Noncombatants. Under the least regulated conditions prisoners are not taken, "no quarter" being the rule. This is true in the case of some Melanesians, while among the Papuans "neither age nor sex is spared in the wars; the enemy's property is destroyed excepting what is carried away; his domestic animals are shot and coconut trees cut down."⁴⁸ Until very recently "the chiefs of the Bawenda settled their political differences quite independently by war, by invasions with murderous surprises of the enemy during the night or in the early morning, by incendiarism, pillaging or waylaying. Many a single enemy has been surprised and assassinated or deceitfully poisoned in order to get rid of him. The victory was celebrated by a dance of the victors over the dead bodies of the enemy, and parts of their flesh were mixed with beef and eaten by the heroes of the day."⁴⁹ In Maori history we frequently find instances of the destruction of unsuspecting parties of enemies by burning them to death in their large meeting-houses.⁵⁰ The aim of Indian warfare was to destroy, and "as every person, old or young, was a part of the present or future strength of the enemy, neither age nor sex was spared and no non-combatants were recognized."⁵¹ The wars between the different tribes in South America were often in principle wars of extermination. In these, as among the Jibaro, "there is no question about weighing life against life; the aim is to completely annihilate the inimical tribe, all members of which form one organic whole and are animated by the same feelings and mode of thought. The victorious party is all the more anxious to leave no single person of the enemy's people, not even small children, alive, as it is feared lest these should later appear as avengers against the victors."⁵² Cruelty, violence, and massacre have been common enough among historical peoples.⁵³

Probably the first mitigation of these conditions occurred when women and children were spared. We read, for instance, in the case of an African tribe: "No prisoners are made and no quarter granted, except to women, who are kept in captivity until the end of the war."⁵⁴ In Samoa, "prisoners, if men, were generally killed; if women, distributed among the conquerors."⁵⁵ In Southern Formosa "women and children are never molested in war; the former are therefore very convenient as interpreters for traveling from one tribe to the other."⁵⁶ Apache men were never taken captive by the Pima, but "women, girls, and young boys of that tribe were sometimes made prisoners, while on other occasions all the inhabitants of a besieged Apache camp were killed."⁵⁷ While the wars of the Jibaros, mentioned above, are usually to the death, younger women may be spared and carried off as prisoners of war, their fate being later to add to the number of their victors', and especially the chiefs',

wives. "There are also numerous instances of small children being spared to be brought up as members of the victorious tribe."⁵⁸

When, later, men were spared by being taken prisoner, further mitigation ensued, but it was not of much consequence until tribes became agricultural and therefore slave-holding. Amongst other tribes prisoners were commonly tortured and killed, though there are a few exceptional cases where they may be adopted into the tribe of the conqueror. Slavery, in its time and place, constituted one of the greatest means of mitigating the cruelties of war. Slavery resulting from war has been treated elsewhere;⁵⁹ here will be mentioned a few instances that are somewhat transitional.

In the Congo region, "prisoners taken are held to ransom, and if not ransomed they are retained and sold or killed according to the whim of the captor."⁶⁰ In one East Central African tribe "prisoners are sold as slaves, and, if wounded, are healed first;"⁶¹ while in another, "if in a fight a man was overpowered and he seized the breast of his captor with his mouth his life was spared, and he lived in the village of his captor and worked herding cattle, but he could not be sold."⁶² Among the Dyaks adoption is a sort of emancipation from slavery. "Other tribes keep their slaves in a condition of perpetual servitude, but the Dyaks allow their friends to ransom them, and if they still remain on their hands, they adopt them into the tribe and enfranchise them. This ceremony is usually performed at a great feast, the owner announcing that he has freed so and so and adopted him as a brother, and he is presented by the chief with a spear which he is told to use in slaying the man who shall afterwards dare to call him a slave."⁶³ The Pimas also treated their captives well, and many of the prisoners have been known to have married into the tribe.⁶⁴ The Tlinkit case seems to be clearly transitional: "Prisoners of war were either killed or held as slaves."⁶⁵ The Guiana Indians, among whom there is no settled slavery, tortured their prisoners of war.⁶⁶

Letourneau⁶⁷ has made a collection along this line, ranging from the sparing of no one to that of nearly all the vanquished. Cortez's allies inflicted tortures on their captives to the extent of scandalizing even him, though he was not oversensitive to others' sufferings. Some make their captives work while awaiting the day of death, which is the beginning of slavery; some kill all who resist but treat those who surrender well; some are careful not to destroy property; often all the men are slain and the women and children preserved; sometimes there were asylums; and ransoms come into play as the property-motive strengthens. The Peruvians did not exterminate their enemies; they were spared, for "soon they will be ours with all that they own." Utilitarian considerations put the curb on cruelty. The Chinese prohibited useless destruction: overturning walls, destroying works of art, kindling fires, and attacking defenseless people.

The inviolability of emissaries is recognized by some savage groups. The bearer of a message in Australia is "never molested by any of the tribes through whose country he may have occasion to travel while engaged on this

duty, even although the people through whom he may pass are not on friendly terms with his tribe."⁶⁸ "When there is a misunderstanding between two tribes, the women of one are sent to the other as ambassadors to arrange the dispute, which they invariably succeed in doing, when women from the other return the visit to testify their approval of the treaty arrived at. The reason women are appointed in this capacity is that they are free from danger, while, should the men go, their lives would be in peril." There might, however, be one or two men in each tribe, called messengers or postmen, whose persons were sacred. "They could travel amongst other tribes with freedom. They carried news, and conducted all negotiations connected with barter."⁶⁹ In more developed tribes traders are similarly immune; and Tylor⁷⁰ regards such an arrangement, where traders are allowed to pass through tribes at war, as one of the first germs of international law.

In some parts of Africa the chief is employed as an ambassador, and his person is respected by the enemy.⁷¹ Among the Kabyles exists a custom known as *anaia*, which is a promise of protection made to one or more persons either by an individual or a village or tribe. It is a sort of safe-conduct. It also permits a native to take refuge even in the house of an enemy, and prisoners on the field of battle may claim it. Under this chivalrous custom women are given special consideration.⁷² During the Crusades the Franks preferred Syrian, Jewish, or Moslem doctors, the last of whom were especially noted for skill and were called in for bad cases which the Christian doctors could do nothing with. "Passing in this way from one party to the other, the doctors furnished a ready means of communication between the two, and were often employed in confidential missions, sometimes even as diplomatic agents. In addition, Franks and Arabs willingly exchanged medical prescriptions, and each one increased his own medical and surgical knowledge from the experience of the other. It is needless to add that the Franks were the great gainers by this interchange of ideas."⁷³ Sir Walter Scott has employed this situation in *The Talisman*.

There are, finally, a number of war-practices which introduce at least the germs of chivalry. Some Australians show a desire to equalize conflicts, and they have been known to provide unarmed Europeans with a set of (Australian) weapons before attacking. The Lushais consider it unsporting to ambush cultivators, for as a chief once said, "How can people live if cultivation is impossible?"⁷⁴ Cases have occurred, while the bellicose Maoris were at war, of their filling canoes with food for their hungry enemies.⁷⁵ In the Canary Islands, not only are women, old people, and children protected in war, but pillage is forbidden and places of worship are not molested.⁷⁶ Letourneau⁷⁷ has a list of similar cases of war-habitudes which mitigate the destructiveness and cruelty of the conflict.

The Greek rule was the slaughter of all men from youth up, and the sale of women and children into slavery; but there were modifications and the Amphictyonic League went to considerable lengths in regulation. The ideal was

that Greeks should have milder rules of war with Greeks than with barbarians.⁷⁸ In the *Herakleida* of Euripides, which is a play designed to set the cultured mores of Athens in contrast with those of Argos, Alkmene, representing the latter, intends to slay Eurystheus, a prisoner of war. The chorus voices the Athenian view.

"Chorus: It is not allowable for you to kill this man.

Servant: Did we take him captive for nothing?

Alkmene: What law, pray, prevents this man from dying?

Chorus: To this country's leaders it is not agreeable.

Alkmene: What is this? They think it not proper to kill an enemy?

Chorus: Not one, at any rate, whom they take alive in battle."

After describing the woes of the Trojan War, Cassandra is made to say: "War, then, the man of sense should shun; but if it comes to that, to perish nobly is no mean glory to the city."⁷⁹ The laws of Manu include war-regulation of a detailed order: one must not strike with weapons concealed in wood or barbed or poisoned or blazing with fire, nor smite one who flees, nor a eunuch, nor a suppliant, nor one who submits, nor one who sleeps, has lost his coat of mail, or is naked or disarmed, nor a non-combatant, nor one who is fighting another foe, nor one whose weapons are broken, nor one in sorrow, or wounded, or in fear.⁸⁰ In the earliest epoch of the Mohammedan war-usages it was the rule not to kill or mistreat women and children of the enemy even if they were not Mohammedans, unless they took part in the battle.⁸¹ During the Middle Ages chivalry was full of more or less empty sentiment, including horror of lies and perfidy, obligation to fight loyally and to defend the weak; but all sorts of excesses were tolerated when it came to the treatment of the unarmed masses. The sentiment and ideals were restricted in this field of application; their essentially grotesque character is burlesqued in *Don Quixote*. Lecky⁸² finds that "the changes Christianity effected in the rights of war were very important," and lists the suppression of the gladiatorial shows which saved thousands of victims; the discouragement of the practice of enslaving prisoners; the ransoming of immense multitudes with charitable contributions, until "it became a recognised principle of international law, that no Christian prisoners should be reduced to slavery"; and the "creation of a new warlike ideal."

§142. The Drift toward Peace.

A FORMAL peace-making was customary among some of the Melanesians when it was felt that a respite was necessary from such severe inter-community feuds as were likely to be perpetual. "Probably such peace-makings did not often occur until the blood accounts between the two communities were tolerably even, and in these formal peace-makings, even when the number which had been killed on either side was the same, each side paid rigorously for those it had killed."¹ If a fighting tribe of Papuans desires to make peace, "they

¹ Seligmann, *Melanesians*, 544-545.

let their wish be known by blocking the way to the enemy's village with a branch which they put across the path, and choose for this purpose some parting of the road which the enemy are sure to pass. In the case of the enemy agreeing to the proposition, they place another branch over the first one, but if they want to go on fighting they turn the branch so that it points in the direction of their antagonists, and place on it a bundle of small tally-sticks, which indicate the number of people they intend to kill before they are willing to make peace." The usual way of making friends is through the medium of the women. "A couple of men with their wives go to the hostile village, and the women are sent a few steps in front. It is a recognized rule in the district that the presence of women in such a case means peace. Such a proposition to cease hostilities is generally accepted—at all events temporarily—and the visitors are well received. The men mutually break each other's beheading-knives in token of peace, and sometimes exchange their arm-guards. In the night the men in the village have connection with the women of their guests, and that is the real object of the visit. This custom is called *era adogo* ('putting out the fire'). After a few days the visit is returned under exactly the same circumstances, and the visitors give up their women to the men in the other village."² There are a number of local peace-symbols: betel-chewing, eating of bits of coconut or other food, sacrifice of a dog, smoking of cigars³—all of which are well understood and must have been long and frequently in practice. In some parts of Southeastern Papua the peace sign is made by touching first the nose and then the navel. The signs at Dobu are somewhat different, each breast being touched in turn, to indicate that you are of one family.⁴ War is ended in the Solomons by one party sending a certain amount of the local money and the same amount being sent in return.⁵

To the fighting Herero and Hottentots the missionaries were "sacro-sanct"; but they had great trouble in keeping the Herero from killing Hottentot peace-emissaries, for the former saw in the latter their former oppressors and the torturers and murderers of their relatives.⁶ When two contending clans among the Bageshu wish to make peace, "the chiefs come together to some place and sit down, a dog is brought and one takes hold of its head and the other of its hind legs, whilst a third man severs it in two with a large knife. The dog is thrown away and the clans are free to intermingle without any fear."⁷ Among the Ba-Yaka alliances are frequently contracted between chiefs, and peace is made in the following manner: "The chiefs of the two tribes meet and eat a cake made of flour in which have been put some of their nail-parings; a fowl is then killed, wrapped in leaves and buried. It is believed that he who breaks the truce will die."⁸ Among the neighboring Ba-Mbala an alliance between two chiefs is contracted by making incisions in the breast of each and rubbing the blood of the other in the wounds. In this case death is the penalty for killing a man belonging to the village of the other. Similar ceremonies of blood-brotherhood will be considered later.⁹ Among the same people there is one form of compact which deserves mention, the pact against bloodshed. The richest chief of the neighborhood will invite the rest of the chiefs in his vicinity to

⁹ §150 of text.

a meeting held on his territory in order to make such a pact. A slave is fattened for the occasion and killed by the host and the invited chiefs and their followers partake of the flesh. Supposing that a chief, after attending an assembly of this kind, kills a slave, every village which took part in the bond has the right to claim compensation, and the murderer is sure to be completely ruined.¹⁰ Among the Nigerians, "when one side is tired of war, women of the other tribe married to men of the former tribe are sent to their relatives with offers of peace. They are naturally sacred, for they have friends on both sides." If peace is agreed upon, representatives of both tribes meet and swear friendship.¹¹ The Kabyles set stones upright to conclude peace-agreements, "and each of them represents the agreement or signature of a tribe to a concluded pact. They knock them down if the agreement is subsequently broken."¹²

The Nagas of India have an elaborate ceremony of peace-making between two villages.¹³ In Borneo, "after past wrongs, peace and good-fellowship cannot be gained by simple asseverations; there must always be a palpable exchange of beads, highly prized jars, brass gongs, etc., as an indemnity. The perpetrator of the wrong, or one of his descendants, must be present with his adherents to join in the sham fight, known as the 'Jawa.'" And there is another ceremony signifying the obliteration of a feud, called "Usut." "The interchange of Usut is obligatory between descendants of enemies whenever they first enter each other's houses; they may have met many times on most friendly terms in the jungle or in the houses of neighbors, but they must not take shelter under one another's roof until they have appeased the wrongs done by and against their ancestors. The simple rite of giving Usut for ancestral wrongs is expanded into the performance of Jawa when, in addition, the descendants have been themselves wrongdoers." First a roughly made iron spear-head is flung into the center of the circle, and on its flat surface a young chicken is decapitated, then torn to pieces and its warm blood smeared over the point. Beads and trinkets are formally exchanged and blood from the spear-head rubbed on the chest or arms of everyone present. The two formerly hostile clans then hail each other as friends.¹⁴ In Samoa there are practices which operate to prevent hostilities from taking place. If two families in a village quarrelled, and wished to fight, the other heads of families and the chief stepped in and forbade; and it was at the peril of either party to carry on the strife contrary to the decided voice of public opinion. In the same way strife may be prevented between any two villages of the district. Hostilities are often prevented by such acts as giving up the culprit, paying a heavy fine, or by bowing down in abject submission, carrying firewood and small stones used in baking a pig, or, perhaps, a few bamboos. "The firewood, stones, and leaves were equivalent to their saying, 'Here we are, your pigs, to be cooked if you please; and here are the materials with which to do it.' Taking bamboos in the hand was as if they said, 'We have come, and here are the knives to cut us up.' A piece of split bamboo was, of old, the usual knife in Samoa."¹⁵ In one New Zealand case, the natives said they were equal and satisfied, "there being exactly the same number killed and wounded on both sides during the war, which was about half-a-dozen; since that time good feeling has existed."¹⁶

Certain American Indian towns were consecrated to peace-ceremonies and were known as "white towns," while others set apart for war-ceremonials were designated as "red towns."¹⁷ Among some tribes there was also a particular village or clan that had the right to shelter or protect a fugitive; among others the chief's tent afforded asylum, or if food was offered and taken the captive was spared.¹⁸ Should the Osage, for instance, be warring against another tribe, and one of the foe slip into camp and beg for protection from the chief, the latter must help him. As soon as possible food was cooked and given the fugitive, and when he had eaten a mouthful he was safe. "He could then go through the camp with impunity. This condition of affairs lasted as long as he remained with the tribe, but it terminated when he returned to his home."¹⁹ This right of asylum was a sort of peace-taboo, similar examples of which will be presented later. A fetishistic device used by the American Indians for many purposes, including peace-ceremonies and alliances, is the calumet. It was "employed by ambassadors and travelers as a passport; it was used in ceremonies designed to conciliate foreign and hostile nations and to conclude lasting peace; to ratify the alliance of friendly tribes; to secure favorable weather for journeys; to bring needed rain; and to attest contracts and treaties which could not be violated without incurring the wrath of the gods. The use of the calumet was inculcated by religious precept and example." When the calumet is designed to be employed in a treaty of alliance against a third tribe, a serpent may be painted on the shaft, and perhaps some other device indicating the motive of the alliance. "By smoking together in the calumet the contracting parties intend to invoke the sun and the other gods as witnesses to the mutual obligations assumed by the parties, and as a guaranty the one to the other that they shall be fulfilled."²⁰

One or two incomplete accounts have been handed down as to the procedure by which peace has been concluded by the Guiana Indians. Thus, on the Orinoco, as soon as the preliminaries were arranged, the parties confirmed it, after their barbarous fashion, by interchanging as many blows with a cudgel as amounted to complete satisfaction. The method of attaining complete satisfaction is this: each member of tribe A, for example, receives a blow for each member of tribe B that he has killed, and *vice versa*, no canceling allowed. In another section the method of concluding a truce is as follows. The interested party, usually the captain, goes into the enemy's country with the chief men and all the youths, who march in battle-array, well equipped with weapons. When at one or two days' journey from the meeting-house they depute some of their number to go and inform the enemy that they wish to be friends and live henceforth on good terms with them. If the offer be well received, they tell those who have halted to come along. The two nations then range themselves in order of battle, just as if they wanted to fight. They fling abuses and reproaches at each other for all the outrages committed. "You stole our women," says one; "you killed and ate my father, cousin, brother," complains another. "Finally, after all these animated speeches, they suddenly throw their arms to the ground with loud manifestations of joy and then proceed to the karbet [meeting-house], where they drink for three or four days."²¹

Where primitive groups live in a state of continual hostility, intercourse is

17 HAI, pt. I, 364.

18 Fletcher, in HAI, II, 915.

21 Roth, in BAE, XXXVIII, §777.

naturally precluded and the phenomenon is presented of isolated, antagonistic groups speaking different dialects. Any device, therefore, which tends to permit intercourse and the treating of strangers as friends instead of enemies is a step toward peace. One such device is for the visiting party to make its presence known and to observe some ceremony instead of walking straight into a camp. In Australia, whether for friendly intercourse or for war, the tribe which seeks a meeting must give notice of its coming in due form. Another custom highly developed among the Australians is the use of ambassadors or messengers. The messenger has to carry a token, by virtue of which he passes safely through the lands of the several tribes. The token is a piece of wood on which are inscribed hieroglyphics that, being read and interpreted, suffice to notify all persons of the nature of the mission. If the mission is a friendly one, the token-stick is streaked with red ochre; if unfriendly, with white ochre. "However unpleasant the tidings may be, the persons of the messengers are held sacred, and they are always patiently heard and hospitably treated. If the message is of such a kind as to require an answer, the answer is given, and the bearer is conducted safely to the boundaries of the district he has invaded."²² Another means of communication and intercourse found all over Australia is the smoke-signal, which is read with keen watchful eyes over considerable distances. According to the nature of the column of smoke the natives know whether a friendly tribe is coming, whether war threatens, where hunting is good, etc., while other signals mean an invitation to an initiation or a corroboree.²³

Blood-relationship and intermarriage operate in many places to prevent hostilities or to provide a means of reconciliation. The effect of the social bond upon war in Polynesia is found in the custom under which "any member of a group nearly related by blood or marriage to persons of another, might, not only during peace, but also in time of war, pass with impunity from the territories of the one to those of the other, and be regarded as a friend in both; and such persons were employed to bear proposals for peace. It is found in the fact also that in acts of violence and death in war persons and families allied by marriage were always spared." The Samoans regarded fighting between blood-relations with horror; one case is mentioned in which close relationship between two chiefs prevented war, even though the quarrel between them was that one of them had carried off the other's wife.²⁴ An instance is cited in the Solomon Islands of a man who had relations in all the islands and so, even in time of war, could go back and forth without fear.²⁵ In Brazil tribal marks serve as peace-guarantees.²⁶ From such situations as the above there developed in the course of time treaties of *connubium* which were peace-pacts of an enduring kind, linking the groups together and bringing them into permanent political relations.

Economic factors also have made for peace, as among the Araucanians where the harvest of the fruit of the pine was of such supreme importance that all inter-tribal quarrels and warfares were suspended by mutual accord during this period.²⁷ Access to deposits of stone, flint, salt, and other desirables implies either war with the people who hold the territory where they are, or a

treaty with them for peaceful access. Cases of peaceful access have already been considered;²⁸ here may be re-emphasized their tendency toward peace, as where, among the American Indians, the pipe-stone quarries constituted peace-centers; hostile tribesmen met there under a strongly sanctioned interdiction of violence.²⁹ The red pipe-stone of Minnesota was sought and carried away peacefully in the midst of war. The treaty of peaceful access was a breach in the relations of war between two groups and was the germ of international law.

Further evidence of the antagonism of trade and war, and of the pacific tendency of the former, is observed in the peace of the market. How hostility interferes with trading is to be seen in the marketing-customs of some Melanesians. One or other party would send a message that in two or three days' time they would come to a certain place prepared to trade. "Spears were always taken and carried at the market, where trouble often ensued and it was not uncommon for a man to be killed. In such circumstances the aggrieved tribe would seek revenge either immediately, or at a subsequent market." Under these conditions the market was necessarily held at irregular intervals.³⁰ Among the Papuans, "at the markets themselves and during the time of the circumcision-month festival the peace of God rules."³¹ These festivals, with attendant suspension of hostilities, break in upon the tendency toward self-isolation and prevent utter lapse of the feeling of tribal unity.³² Among the northern African tribes it took some public safe-conduct or peace-pact to overcome the mutual suspicions of peoples who had been killing one another, before they dared come together in a market.³³ Peace at market-places is one of the conquests of trade over war, which begin with silent barter;³⁴ and provisions are quite common which limit hostilities in time as well as in space, for they must not take place on holy days (holidays) or rest days.³⁵ The story of Herodotus³⁶ about the Argippeans of eastern Scythia, who are holy, just, peaceable, unarmed people, carrying on trade and the conciliation of strife in the midst of wild nomads, is repeated over and over again in the case of a sanctuary-grave of a hero or saint, or a relic-deposit, in charge of a reputedly sacred family which sells things required in sacrifices, adjudicates quarrels, protects fugitives, and in whose vicinity a market has developed.³⁷

Religion has been an influential factor in the development of peace. Some evidence of this influence has already been given. The Australians never allowed any display of arms anywhere near the storehouses where the sacred stones, whirr-sticks, and amulets were kept.³⁸ A similar religious taboo on strife prevailed among the Cheyenne Indians during the ceremony of renewing the arrows: "While the arrows were being renewed, a guard of soldiers was stationed about the camp. No noise was permitted; no one was allowed to do anything that was bad. No one might be cross, speak angrily, or dispute with anyone; all must be good-natured and friendly."³⁹ The religious festival has operated to bring together sub-groups which by migrating over a great territory have become strange and perhaps hostile to each other, but at the time and

place of the meeting peace is imposed. A peace-covenant and peace-group may be formed under religious sanction which, even though temporary, is by no means trivial. There was a peace of the gods at the time of the great festivals among the Greeks, and sometimes a feud was brought to an end at such a time. "The god-peace of Olympia and the holy neutrality of all Elis have their own history. But real wars were not hindered by the festivals and scarcely momentarily interrupted."⁴⁰ There was a two months' peace of God for visitors to the festival mysteries of Eleusis.⁴¹ The pre-Mohammed Arabs had certain asylums, but there were not many holy places recognized universally—in fact, Mecca was about the only one. There, before Mohammed's time, no blood except that of sacrificed animals might be spilled; there no weapons might be used, no trees felled, no wild animals killed. At first the tabooed area included only the temple and city, but was later much extended. There, where trade flourished, was an inviolable peace-area, called *harem*. For local communities the graves of the ancestors and the homes were asylums. The Mohammedans had also four holy months during which fighting was forbidden, a custom taken out of the heathen time. Not only war, but the chief cause of war, blood-vengeance, was interdicted during these months.⁴²

A development of the Middle Ages was the so-called "house-peace." The Teutonic freeman, in his homestead, was in all aspects autocratic, though outside of it he was but a commoner of the mass.⁴³ "If you commit an act of violence in a man's house, whatever you may have to pay to the person whom you strike and to the king, you will also have to make amends to the owner of the house, even though he be but a ceorl or a boor, for you have broken his peace."⁴⁴ The notion that "every man's house is his castle" was the first effort of the law, thinks Lacroix,⁴⁵ to protect a man whom it could not protect in his person. Now that the law protects a man always and everywhere, this old principle is unimportant. The "house-peace" later extended to cover fields and roads, it played a considerable rôle in German law, and along with it went the church-peace, market-peace, and peace of God.⁴⁶ The "woman-peace," assuring her immunity of body and goods at all times, was early established in Northern and German law.⁴⁷ In Scandinavia there was a peace-interval for trade at religious festivals; in general, trade went with peace, but was readily replaced, on occasion, by robbery and war.⁴⁸ A common share in the sacrifices was a sign of obligation to peace; but the Upsala king was charged, as chief, with the sacrifices at that sanctuary of the race. Such a holy spot was tabooed for peace even to the gods. It is a case of a cult-group which is a peace-group, and led to the development of a trading-center and also of an assembly, or *thing*. Disputes were settled there and law developed. The great annual sacrifices collected and united the people. Where they were held was peace, and participation meant peace between the separate tribes. Under that peace-taboo were held feasts, conferences, judgments, sales, and contracts, so that *thing* meant not only assembly but also sacrifice, hospitality, parliament-day in court, and fair.⁴⁹ Church influence caused weapons to be left out of *thing* first in Ice-

land, then in Denmark and later in Norway.⁵⁰ "The dwelling-places of Northern kings seem, like sanctuaries, to have been regarded as possessing a sacred peace. The term 'field of peace' is found applied to the Swedish king's dwelling as early as Beowulf."⁵¹

The church-peace and king's peace are common phenomena of the Middle Ages;⁵² the latter was bought by outlaws, Jews, and merchants.⁵³ Quarrels in a church were forbidden and if any occurred offenders were fined; fighting was interdicted during festivals or fasts and on holy days; and in other ways peace and order were enjoined under the truce of God.⁵⁴ To the Peace of God succeeded the Peace of the King and a rapid development occurred in the list of offenses which came within its orbit. At first the king's peace was purely personal; when he died there was no royal peace until his successor proclaimed his own; but later, following the death of Henry III in England, perpetual peace was proclaimed. Hitherto it had been the peace of the king, now it became the peace of the kingdom.⁵⁵ A most important step had been taken toward securing law and order within the group.

§149. Clan, Gens, Etc.

IN the dual organization characteristic of Melanesian society, the population consists of two exogamous groups which Rivers¹ calls moieties, a man of one moiety having to marry a woman of the other. In every case where this form of social organization is known to exist, descent is in the female line so that a man belongs to the moiety of his mother. By contrast, the word "tribe" is applied to a group of a simple kind, always in Melanesia settled in a definite locality, which speaks a common language and is capable of uniting for common action, as in warfare. In some instances the grouping seems to be by hamlets, the inhabitants of each hamlet being all more or less closely related either by birth, marriage, or adoption, so that besides constituting the functional social unit of public life the hamlet, in the majority of cases, is co-extensive with a family group.²

In all the villages of San Cristoval, Solomon Islands, exogamous clans with mother-descent prevail and form the most outstanding feature of the social organization of the people. "Just as the village is divided among the clans, so all property on the island is likewise divided; garden land, coco-nuts, and so on: each clan has its own. When a party of men from Santa Anna go on a canoe voyage up the coast to Haununu, the Haununu people remark on the fact that members of different clans will not even then, among strangers, eat food cooked in a common pot, but it must be cooked in a separate vessel for each clan. The members of the clans believe they are the descendants of the animals after which the clans are named; stories are told of the original animal ancestor of the clan: no member may eat of the animal from which his clan

takes its name, and sacrifices and prayers are regularly offered by the members of clans to their animal ancestors. This seems to present a case of pure totemism, in which all the elements necessary to constitute totemism are present."³

Among the Nama Hottentots of Southwest Africa a tribe is composed of a number of patrilineal sibs or clans, that is, of groups of people claiming to be related in the male line; one of these sibs claims seniority, and the chieftainship is hereditary in this senior sib in the male line. Through the whole course of Nama history the sib was the strongest social unit. Time and again a strong sib would go off on its own, asserting its independence of the others, and sib loyalty was always stronger than tribal loyalty. "It is no wonder, then, that the chief among the Hottentots was little more than *primus inter pares*. He was acknowledged to be the head of the senior sib and, if a person of fine character, was accorded a great deal of respect, but the heads of the other sibs acted as his council and he could not do much without their coöperation." Membership in a sib guaranteed to a person a very strong measure of protection, for he could always count on the support of his fellow sib-members.⁴ The Akamba population of East Africa is divided into clans and these into families. The ties between clan-members are extremely close; "so close is the relationship that members of the clan may not marry although they have not met for generations." A village among these people is really the abode of a family numbering as many huts as there are married women.⁵ Up to comparatively recent times, the clan among the Kikuyu was a unit and each clan inhabited its own location.⁶ The Bahima are divided up into fourteen clans, each having its own particular sacred object or totem. "The members of a clan are all closely related, the same term is used in speaking of a brother or sister or cousin; the clansmen must be cared for in sickness, helped in distress, righted when wronged, and avenged in death by the clan."⁷ A Ba-Yaka child belongs to the village of his maternal uncle; no others save blood relations are admitted as members of the village community.⁸ On the Upper Congo, as elsewhere, geographical nearness does not produce a feeling of kinship, but blood relations, no matter how far apart they live, feel the affinity strongly. The terms used here to designate the various social organizations are quite significant: *Muu* is the word used for family, and it also means hearth, fire-place, seeming to indicate those who sat around the same fire. *Mboko* signifies branch of family having the same male ancestors; *Ekanga* means tribe, clan, from *Kanga*, to tie together, probably showing that they were tied together by bonds of blood.⁹ The importance of blood-relationship is seen in the custom among the Fan that when two natives who are members of the same tribe or of allied tribes meet, they recite their respective lists of ancestors, even up to twenty generations or more, to see if they are related. The ethnographer¹⁰ who reports this states that when he used to arrive in a strange village he found it good policy to recite his own list of ancestors, taking care to make them correspond to the ancestors of the chief; for good measure he would add some more ancestors to indicate that he came from a family more closely related than the chief's to the primitive

stock, and then, drawing on his memory of the Biblical genealogies, would finally arrive at Adam, the son of God, where he must of necessity stop. Upon this recital the astonished chief would recognize in him an ally and relative and treat him accordingly. "If fear is the beginning of wisdom, as the Scriptures say, it was often, in deference to me, the sentiment of my black friends."

Among certain West African tribes, the "family consists solely of persons who are connected by uterine ties. . . . The father is never related by blood to his children, and is not considered as belonging to the family. . . . The clan name is the test of blood-relationship, and as property follows the laws of blood-descent, it ensues that property never goes out of the clan; for, with descent in the female line, a family is only a small circle of persons, all of whom bear the same clan-name, within the larger circle of the clan itself." But this condition cannot hold when the blood-tie between father and child has been recognized; "the result of this recognition has been the inevitable downfall of the clan-system, which is only possible so long as descent is traced solely on one side of the house. . . . Since two persons of the same clan-name may, under the clan-system, never marry, it follows that husband and wife must be of different clans. Let us say that one is a Dog and the other a Leopard. The clan-name is extended to all who are of the same blood; therefore, directly the blood-relationship between father and child comes to be acknowledged, the children of such a pair as we have supposed, instead of being, as heretofore, simply Leopards, would be Dog-Leopards, and would belong to two clans. They in their turn might marry with persons similarly belonging to two clans, say Cat-Snakes, and the offspring of these unions would belong to four clans. The clan-system thus becomes altogether unworkable, because, as the number of clans is limited and cannot be added to, if the clan name still remained the test of blood-relationship and a bar to marriage, the result in a few generations would be that no marriages would be possible. Consequently the clan-name ceases to be the test of consanguinity, kinship is traced in some other way, and the clan-system disappears." Marriage within the known circle of consanguinity remains forbidden.¹¹

Dundas¹² has described the social organization in East Africa, where ordinarily a village comprises simply the huts of the wives of one man. "The head of such a village is then the senior member of the family. The villages are generally built in groups, which at times are so close together that they form almost one continuous village; in other cases they are more scattered, but rarely completely isolated. Such groups form what is called a *thome*. . . . In practice the head of each village is alone recognised, because he is the head of the family, but since he is vaguely subordinate to the senior elder of the *thome*, the senior elder of the group is invested with a certain authority. The *thome* is almost the most extensive combination natural to the tribes, and the authority of its elder is the greatest individual authority comprehended." From the above he concludes that the state is simply the family, and for certain purposes it extends to groups of families. "It was between these groups that internal fighting broke out, but not infrequently also within the *thome* there were dissensions and hostilities. On the other hand, there are common objects, if not common rule, which form ties extending beyond the *thome*, and whereby at any rate a loosely connected community is made possible. Most important

¹¹ Ellis, *Yoruba*, 174, 175, 176; Keane, *Ethnology*, 6, 7.

¹² In JAI, XLV, 239-240.

in this respect are the common places of sacrifice. . . . Thus a religious union is formed which centres around the sacred places, and combines the village groups through the common interest that their elders have in them. Apart from religion there is a great deal in ordinary custom which tends to create ties between certain groups. Thus a peculiar manner of performing a dance will draw together the members of certain families, even from youth."

Among the Gilyak of Siberia, "the father-in-law of one clansman is the father-in-law of the whole clan; and the son-in-law of a clansman is the son-in-law of the whole clan. The men form the permanent element in the clan; the women either leave the clan or come to it from another. So the clan forms a society or union, cemented by common rights and marital duties of men related through their fathers, taking their wives from another similar group, and giving their women in marriage to a third clan, all clans being thus exogamic and patriarchal in organization. In spite of the dominant patriarchal principle, Gilyak are related also through their mothers, for they have a common 'father-in-law' clan; and all women coming into a clan are to each other in the relationship of sister, aunt, or niece. . . . The principle that a man must take his wife from his mother's clan, that the wife must be a blood-relative of her husband, is a religious principle, connected with the cult of ancestors, especially with mother-cult. No clansman need fear that at his death he will leave his family without support, for even while he lives his wife and children are nominally, often even actually, the wife and children of his brother; and at his death one of his brothers, chosen by the clansmen, is bound to undertake the rights and duties of father and husband towards his widow."¹³

Yakut social divisions formerly depended upon the herds of horses, and these upon pasture. The mother-clan, called *rod*, was a group owning and using together, in some locality, herds, game, and houses, and "the feeling of blood-bond was at first very vague." At first only older and younger, brothers and sisters, mothers and children, were distinguished; later the family took form, and uncles, aunts, nephews, grandfathers, and grandchildren were recognized."¹⁴ When the Yakuts began to herd cattle, this involved a division of the tribe into smaller social groups, so that the memory of the old large herds of horses and large groups of people was preserved only in the ancient poems. Thus, in the new economic conditions, the family came to be the most important social unit, more stable than the old clans of the horse-breeders. "Antagonism between family and clan shows itself nowadays in disputes which arise over questions of inheritance. Failing a male heir, claim to property lapses to the clan, and even a married sister of the deceased receives nothing." The whole clan to which a murderer belonged was held responsible for the crime, and must make compensation either in blood or by payment of damages. The clan-organization is relatively strong among the Tungus proper; the members of a clan may not marry each other; the clan is governed by an elder whose office is hereditary. This organization has been preserved most pure among those Tungus who have remained in isolated districts, mixing with alien elements only on their borders; that is, it has remained in its purest state among the nomadic and wandering tribes, especially the latter. "Christianity and a sedentary mode of life have been unfavourable to the preservation of their social structure no less than to that of their religious cults." The only well-defined

¹³ Czaplicka, *Aborig. Siberia*, 43-44.

¹⁴ Sieroshevski, *Yakuts* (Russ.), 436, 507; *Yakuts* (Pol.), 304.

and stable social unit among the Koryak is the family, though there are indications of a tendency for families related by marriage to draw together in larger groups, united by certain moral and material obligations—"a tendency that might have led to the establishment of a real clan organization, but for the destructive influence of the Russians." The transition from the kinship to the territorial basis of social organization may be seen in the case of the Finnic tribes of Siberia. Among them the clan has been in the past the most important social unit, being united by its descent from a common founder-protector and by a common cult, and comprising from ten to thirty villages. "At the present day, however, the group of villages is becoming more and more a territorial unit, known as *mer*, and less of a clan in the strict sense." On the other hand, these people have never exhibited a tendency to unite into anything resembling a nation or even an organized tribe; "they have always been grouped in clans independent of each other, each clan having its own chief, and there was seldom even anything like an alliance of clans. The chief (prince) was the real ruler, but on certain important occasions there was an assembly, in which only the oldest members of the clans were allowed to take part in the discussions."¹⁵

Among the hill tribes of Central India exists a situation closely analogous to that mentioned above in the case of certain West Africans: "the clan rule has to be replaced by some other formula, as, for instance, by prohibiting the marriage of any descendants of a common pair or tabooing the intercourse of cousins, which is actually what has happened among the more advanced Dravidians, while the Gonds marry cousins by preference."¹⁶ The unit of Angami society is not the village but the *khel*, composed of supposed descendants from a common ancestor, whose name the *khel* bears. "These *khels* are exogamous, no man being allowed to marry a woman of his own *khel*. . . . Children belong to the *khel* of the father."¹⁷ The unit of Sema society is not the exogamous clan, as among the Angamis; clan feeling exists, as does tribal feeling, but it has no organs. "The basis of Sema society is the village, or part of a village, which is under the control of a chief. . . . In most of such groups there are to be found men of many, or at least of several, different clans. The predominant position, however, of the chief, and of his relatives on the male side, leads to the rough classification of the whole group as of their clan. The real pivot of Sema society is the chief. This is not to suggest, however, that the clan is unimportant. It pervades the life of the ordinary Sema from his birth upwards, determining, or at any rate influencing, his choice of food, of wives, of friends, and sometimes of enemies."¹⁸ Furness¹⁹ has likened the village *khels* of the Nagas to the molecules of a tribe. "Let me borrow still further from the molecular theory," he continues, "and designate as atoms, of which the tribal molecules are composed, the *jhats* or clans which enter into the constitution of a *khel*. . . . Each *khel* in a village may be made up of one or several *jhats* living amicably together and intermarrying one with the other but never marrying within the *jhat*. . . . that those who lived in *khels* composed of but one *jhat* declared that marriage within their own *khel* was prohibited, while those living in *khels* composed of several *jhats* declared emphatically that they did not have to go outside of their *khel* to seek a husband or wife. . . . This interdiction of marriage in the *jhat* was undoubtedly designed to prevent inbreeding,

¹⁵ Czaplicka, *Aborig. Siberia*, 57, 51-53, 32, 67-69, 36.

¹⁹ In JAI, XXXII, 447-448.

but, since the mother's *jhat* is ignored, it is but a half measure, and the marriage of first cousins on the mother's side of the family and also of uncle and niece are unrestricted." The fundamental feature of the social organization of the Todas is the division of the community into two perfectly distinct groups, which are endogamous. This is the so-called dual organization, again, into two divisions or moieties. Each of these primary divisions is subdivided into a number of secondary divisions, which are exogamous, and may be termed clans. The members of a clan have many common rights and privileges which bind them together, so that the clan-tie has a very real meaning. Property, however, is largely centered in the family or the individual, and "the Todas are in a state of social evolution in which the common bond constituted by membership of the clan has been largely replaced by the bond constituted by the family."²⁰

The division of the Chinese into clans "has had a depressing effect upon their good government. It resembles in general the arrangement of the Scottish clans, as do the evils arising from their dissensions and feuds those which history records as excited among the Highlanders by the rivalry between Campbells and Macgregors. . . . There are only about four hundred clans in the whole of China, but inasmuch as all of the same surname do not live in the same place, the separation of a clan answers the same purpose as multiplying it."²¹ "Originally developing by coalescence of villages lying near one another, the cities of the Middle Kingdom have preserved the clan-system in considerable purity. The hamlets and quarters into which they are divided have each one a patriarch at the head whose influence and ascendancy over the inhabitants does not fall much below that of the village-authorities." But they have lost most of their judiciary powers to the mandarins.²² "Altogether there were in ancient Japan, after the beginning of the historic era, 1182 clans, great and small; and these appear to have established the same number of cults. . . . It was only with the breaking-up of the clan-system in Japan that the possibilities of starvation for the worker first came into existence. And as, in antique Europe, the enfranchised client-class and plebeian-class developed, under like conditions, into a democracy clamouring for suffrage and all political rights, so in Japan have the common people developed the political instinct, in self-protection."²³

Among the Malays of Sumatra the tribe is built up out of families and kin-groups, whose heads form the actual government. Generally descent is to a brother born of the same mother or to a sister's son. These heads of kin-groups are the judges and receive tribute of rice and other gifts, and their subjects bear the cost of weddings and funerals for them. Among the Malays in general the foundation of the regulative system lies in the family bond.²⁴ In Sumatra the division within which a native may not marry is responsible for him, and must pay his fines if he cannot. Out of some of these bodies a member may be expelled, but the Batak never loses his membership. The bigger the *blah* the greater the influence of its headman.²⁵ The Alfurs of Buru are divided into various groups called *fennas*, each of which consists of a number of families. Each family is under the oversight of the oldest male blood-member and forms a more or less independent part of the fenna. "Though this union, in families,

of the individuals who belong to the same fenna has acquired in a certain sense a political character, one must keep well in mind that the members of these families are still bound to each other by pure bonds of blood-kinship, in contrast with the fennas where the ties of kinship which originally bound the members to each other have, in the course of time, evolved into pure political bonds." The fennas may be united into federations when the heads are related or have long lived in good harmony.²⁶ The clan-system is found also in Polynesia, and always connects the political division with the religion. In general children belong to the mother's family and the children of a man's sister are his nearest relatives in the younger generation. A man must always marry a woman of another family. Each family is divided into four branches, each of which has numerous subdivisions which are sharply separated from one another. Each subdivision has its distinguishing symbol, generally an animal, which is protected from harm because the life of the group is closely connected with it. This clan-system has deeper influence than any other social institution.²⁷

Morgan²⁸ has much to say of the clans, which he calls gentes, and other divisions in North America. The clan-system is not universal, but very widespread. The chief was only the first of the consanguineous group and called those under his jurisdiction "nephews." Each village was composed of several clans or parts of clans, and the head-assembly of clan-heads was the tribal council.²⁹

Besides their geographical divisions, the Tlinkit had the dual organization; they "were separated socially into two sides or phratries, each strictly exogamic with descent through the mother. . . . One small group was outside of both the phratries and its members could marry into either. Each phratry was subdivided into clans or consanguineal bonds, the members of which were more closely related to one another than to other members of the phratry; and each of these bonds usually derived its origin from some town or camp it had once occupied. They were, therefore, in a way local groups, but they differed from the geographical groups . . . in being social divisions instead of comprising the accidental occupants of one locality. Thus every geographical division contained members of both phratries and usually of several clans of each phratry, while on the other hand a clan was often distributed among two or more geographical groups. Finally the clans were subdivided into house groups, the members of which might occupy one or several houses." One of the common errors of writers on the natives is to confound subdivisions with main ones. Another is to use the terms tribe and clan interchangeably. "A tribe may be divided into clans, but not a clan into tribes. A tribe may be composed of several sub-totems but of the same great phratry; a clan, on the other hand, is composed of people of the same totem. Every native has his sub-totem which, in turn, determines the main division to which he belongs."³⁰ Among the Kwakiutl, "each clan derives its origin from a mythical ancestor, who built his house at a certain place and whose descendants lived at that place," so that the clan appears in the form of a village community.³¹ The tribes of this region

vary between maternal and paternal descent, and the tribes of the Oregon coast show no sign of any totemic clan system.³² Of the Seminoles it is written that their gens (clan) is a consanguineous group tracing lineage sometimes through the mother and again through the father. "The gens is the grand unit of social organization, and for many purposes is the basis of governmental organization."³³ In various villages, certain clans enjoyed a sort of hegemony.³⁴ Selecting the Iroquois tribes as typical of those in which the clan-organization had reached its highest development, it is found that "in such a tribe citizenship consisted in being by birth or adoption a member of a clan, and membership by birth in a clan was traced only through the mother and her female ancestors; hence it was solely through the mother that the clan was preserved and kept distinct from every other. But although the child acquired his birth-rights only through his mother, singularly enough it was through the father that his or her kinship was extended beyond his own into that of his father's clan, which owed to the offspring of its sons certain important obligations, which bound these two clans together not only by marriage but by the stronger tie of a recognized kinship. By this process the clans of the tribe were bound together into a tribal unity."³⁵

McGee³⁶ enters quite minutely into the discussion of the clan, distinguishing it from the gens as a mother-descent group from one with father-descent. "The simplest demotic unit found among the aborigines is the clan or mother-descent group, in which the normal conjugal relation is essentially monogamous, in which marriage is more or less strictly regulated by a system of prohibitions, and in which the chief conjugal regulation is commonly that of exogamy with respect to the clan; in higher groups, more deeply affected by contact with neighboring peoples, the simple clan organization is sometimes found to be modified, (1) by the adoption and subsequent conjugation of captive men and boys, and, doubtless more profoundly, (2) by the adoption and polygamous marriage of female captives; and in still more highly organized groups the mother-descent is lost and polygamy is regular and limited only by the capacity of the husband as a provider. The second and third stages are commonly characterized, like the first, by established prohibitions and by clan exogamy; though with the advance in organization amicable relations with certain other groups are usually established, whereby the germ of tribal organization is implanted and a system of interclan marriage, or tribal endogamy, is developed. With further advance the mother-descent group is transformed into a father-descent group, when the clan is replaced by the gens; and polygamy is a common feature of the gentile organization. In all of these stages the conjugal and consanguineal regulations are affected by the militant habits characteristic of primitive groups; more warriors than women are slain in battle, and there are more female captives than male; and thus the polygamy is mainly or wholly polygny. In many cases civil conditions combine with or partially replace the militant conditions, yet the tendency of conjugal development is not changed. Among the Seri Indians, probably the most primitive tribe in North America, in which the demotic unit is the clan, there is a rigorous marriage custom under which the would-be groom is required to enter the family of the girl and

demonstrate (1) his capacity as a provider and (2) his strength or character as a man, by a year's probation, before he is finally accepted—the conjugal theory of the tribe being monogamy, though the practice, at least during recent years, has, by reason of conditions, passed into polygyny. Among several other tribes of more provident and less exclusive habit, the first of the two conditions recognized by the Seri is met by rich presents (representing accumulated property) from the groom to the girl's family, the second condition being usually ignored, the clan organization remaining in force; among still other tribes the first condition is more or less vaguely recognized, though the voluntary present is commuted into, or replaced by, a negotiated value exacted by the girl's family, when the mother's descent is commonly vestigial; and in the next stage, which is abundantly exemplified, wife-purchase prevails, and the clan is replaced by the gens. In this succession the development of wife-purchase and the decadence of mother-descent may be traced, and it is significant that there is a tendency first toward partial enslavement of the wife and later toward the multiplication of wives to the limit of the husband's means, and toward transforming all, or all but one, of the wives into menials. Thus the lines of development under militant and civil conditions are essentially parallel."

"Starting from the tribe or state as a whole, we find among the Omahas two half-tribes. . . . Next to the half-tribes are the gentes, of which the Omahas have ten. Each gens in turn is divided into sub-gentes," and these into groups of a lower order.³⁷ The gens, which term is used by Fletcher and La Flesche to indicate that the kinship-group traced descent in the paternal rather than the maternal line, was called in the Omaha tongue by a word meaning "village." "The same term was applied to the village in which all the tribe dwelt. When the Omaha visited the towns and cities of the white people, they applied to these settlements the same designation." While the idea of relationship is not directly stated, the word which they added to the term for "village" is understood to indicate a village of people who are kindred, of one kind, between whom marriage is prohibited. A subdivision differed from a sub-gens in not having a distinctive rite, although it had a particular office in the rite belonging to the gens. The common bond between the sub-gentes of a gens was that of kinship, traced solely through the father. Marriage between the members of the sub-gentes or subdivisions of a gens was forbidden. "It is apparent that the Omaha gens was not a political organization. It differed from the Latin gens in that the people composing it did not claim to be descended from a common ancestor from whom the group took its name and crest. There was, however, one point of resemblance, and because of this one point of resemblance the name gens is applied to the Omaha group; namely, the practice of a common rite the title to share in which descended solely through the father. Beyond this one point all resemblance ends. The rights and duties of the Omaha father in no way corresponded to those devolving on the head of a Roman family. Nor was the Omaha group a clan, for the bond between the people was not because of a common ancestor whose name and crest were the clan designation and from whom were descended the hereditary rulers of the clan. The Omaha gens was a group of exogamous kindred who practised a particular rite, the child's birthright to which descended solely through the father; and the symbol characteristic of that rite became the symbol, crest, or 'totem,' of the gens.

There was no political or governing chief of an Omaha gens or subgens, but there were persons to whom belonged the hereditary right to be keepers, or 'priests,' in the ceremonies that were in charge of the gens. The Omaha gens, the two grand divisions composing the tribe, and the tribe as a whole, were each and all expressive and representative of certain fundamental religious ideas and beliefs that were dramatized in rites. Later, when the tribe was re-organized into its present form, the political government of the people was vested in certain chiefs, but these did not derive their position from their gentes as representatives of political organizations."³⁸

The Arapaho recognize among themselves five original divisions, each having a different dialect, but these do not imply a clan or gentile system. "With the eastern tribes and those who have removed from the east or timbered country . . . the gentile system is so much a part of their daily life that it is one of the first things to attract the attention of the observer." The Comanches do not know that system, though they have five recognized divisions, and used to have thirteen or more. "The Kiowa do not have the gentile system, and there is no restriction as to intermarriage among the divisions. They have six tribal divisions, including the Apache associated with them, who form a component part of the Kiowa camping circle." The Caddo, originally along the lower Red River, had ten gentes, with animal names; and the members of a gens would not kill the animal from which it takes its name.³⁹

It is to be noted that groups can get names from the place where they live, especially from a river, mountain, or other natural feature; from some bodily peculiarity, of which skin-color is only one; from peculiarity of language or pronunciation, or of customs; from a selected plant or animal, or even from diet; or from some ancestral hero or living chief.⁴⁰

Letourneau⁴¹ finds the Roman political origins similar to the Greek in some important respects. Gentes united to form larger aggregations, such as phratries or *curiae*, and gradually developed into cities, the larger political units. Of "gens" it is stated: "The etymology of the word is transparent: it is based on the nature of procreation, and that in the legal sense which gives the father authority over the son. Hence the two ideas of the family and of the sib [kin-group]: the former consists of the free persons under the authority of a living ascendant, the latter of those free persons who would have been under such authority, had no death taken place." The mark of the sib is the *nomen gentile*, or gens-name, which is added to the name of the individual; Quintus Fabius means Quintus of the Fabian gens. "The members of the sib are called *gentiles*, also *patres*, 'house-fathers,' and *patricii*."⁴² The clan-relations in the North, covering the right of revenge, clan unity and possessions, duty of mutual support, and so forth, were essentially similar to those already sketched.⁴³ Abandonment of one's clan, under the Salic Law, demanded a special symbolic ceremony.⁴⁴

Schrader⁴⁵ states that the Slavonic *bratstvo* is formed when the blood-brothers of a house-community separate, but still continue to form a political (territorial) and religious (common tutelary hero) organization, possessing a

common landed estate. Every *bratstvo* has its family legend in honor of the common ancestor. In the public assemblies, only the household heads have a seat and vote, the rest simply the right of acclamation. "The *bratstvo* in old days consisted of cousins to the *nth* degree, but in the nature of things it became necessary in time to subdivide large *bratstvos* in intermarriageable groups. At the present day in Montenegro the *bratstvo* does not go beyond third cousins who may marry. . . . The *bratstvo* held together very strongly. In case of the murder of one member the whole *bratstvo* flew to arms."⁴⁶ The Latin gens corresponds to this South Slav form and the Greek *phrêtrê* is aligned with them.

Vinogradoff⁴⁷ draws three main conclusions from the survey of Aryan kinship organization: "(1) The kindred, as a variety of the clan system, was formed by the alliance between agnatic households for purposes of defence and mutual help. It involved a subsidiary recognition of relationship through women. (2) The arrangement of agriculture on the open-field system, based on the solidarity of the groups of neighbour cultivators, was originally conditioned by kinship. (3) The transition from tribal to village communities was brought about by a standardization of holdings which aimed at establishing a fair proportion between the rights and the duties of the peasants."

Starcke,⁴⁸ who theorizes much and tenuously over the clan, states that while the family is "the group which includes different generations, taking into account their more or less remote kinship, . . . the group in which the different degrees of kinship are not taken into account belongs to the category of the *Clan*. . . . Families are founded and again dissolved while the clan persists unchanged. . . . The clan consists of a group allied by blood, endowed with important juridical rights." He here defines the clan by unity of blood; elsewhere he has much to say about a tie resulting from social contact. "The tattoo marks make it possible to discover the remote connection between clans, and this token has such a powerful influence on the mind that there is no feud between tribes which are tattooed in the same way." He thinks social life begins with the family, ruled by the father, and that clans are subsequently formed. "The clan differed from the tribe as a part from the whole. The tribe was the unit with respect to other and hostile tribes but the clan could only be opposed to other clans." Yet the author thinks the family did not develop into the clan, but was swallowed up in it, rather; the forces that form the family cease to work when their spheres of operation become too great. The clan exists for the struggle for existence, but on a larger scale, and consists not of families, but of individuals, its organization being like that of the tribe rather than of the family. The blood-tie remains, however, even if in less definite form. The clan was consanguineous, even if artificially so through adoption.⁴⁹

§150. Blood-Brotherhood and Guest-Friendship.

BLOOD-BROTHERHOOD is an important custom in many parts of Africa, where its effect in producing friendship between the contracting parties, in forming alliances, and in stopping feuds is well marked. When two persons of different

clans or tribes, among the Baganda, wish to make an indissoluble bond with one another, they perform the *mukago* or blood-brotherhood ceremony. "They each make a slight cut in the stomach below the navel, with the knife, holding the flesh with the left hand; the coffee bean pod is broken and each man takes a bean from it, smears it with his blood, and places it in the palm of his right hand; each takes the bean from the other's hand with his lips, and each holds his hand over the other's mouth until the bean is swallowed; when the berry is swallowed they tell each other their totem, and commit their children to each other's care. The witnesses are relatives or close friends; all partake of the feast which immediately follows. This is the most solemn and binding oath, and cannot be broken without bodily injury coming upon the person who breaks it; the consequence is often prolonged sickness and death." If a slave makes *mukago* with a member of his master's family he takes its totem and becomes a free man and one of the clan. The Bahima method of making blood-brotherhood is somewhat similar; it is done by pouring a little milk into the palm of the hand and dropping into it one or two drops of blood taken from the pit of the stomach. "Each promises to be true and faithful to the other, and to be a father to the other's family in case of need. Sometimes coffee berries are used for this ceremony," as in the instance above.¹ As an introduction to blood-brotherhood in the East African Protectorate, friendship is usually made by the exchange of honey-beer and a goat. "Later the two meet, bringing honey beer in a bowl from which each takes a mouthful and spits it out into the bowl again, after which each drinks half of the beer. After a few days the two meet again, and each cuts the other with a knife very slightly on the back of the right hand and licks the blood off. The brotherhood thus established is most binding and if broken by either party will result in his death. The blood brotherhood passes on to their children after their deaths, but a fresh ceremony between the children is not required. In consequence of this the children of blood-brothers may never marry." On account of the prohibition against children of blood-brothers marrying—having become by the covenant "blood-relations"—the Theraka say that they never make blood-brotherhood with members of other clans; since, then, it is an almost senseless undertaking between members of one clan it is rarely made with anyone but a foreigner.²

In British East Africa, when forming blood-brotherhood the contracting parties sit down opposite each other and each man will make two cuts on the breast-bone of the other with a knife so that blood flows. In the meantime a man who has killed a goat has taken out its liver and is roasting it at the fire. "When the meat is slightly cooked he cuts off two pieces from it and hands one to each of the contracting parties, who take it and rub it in the blood on their own chest. Each of these will now hand his piece of meat to the other, promising to help him in everything and in future to look upon him as his brother. Each eats the meat smeared with the blood of the other, and the ceremony is finished."³ Again, the ceremony consists in inflicting a small wound on both of the parties and applying a few drops of blood from the wound of one to that of the other; after this their property is treated as being held in common.⁴ How blood-brotherhood may put an end to hostility is clearly ob-

¹ Roscoe, in JAI, XXXII, 68, and in JAI, XXXVII, 117.

served among the Congo people, where, as in the case of the Bangala, a constantly recurring quarrel between families and towns of equal strength is settled by the important persons on each side entering into such a covenant. A go-between is appointed who arranges for a meeting at some neutral place; a stick called *ndeko* is procured and carefully scraped, and these scrapings are mixed with salt. "The contracting parties clasp each other's right hand with the *ndeko* between the palms; then some incisions are made on the arms and the mixture of *ndeko*-scrapings and salt is rubbed on the cuts; each then puts his mouth to the incisions on the other's arm and sucks for a few moments, after which one of the contracting parties takes the *ndeko* stick and strikes the wrists and knees of the other, saying: 'If ever I break this covenant may I be cursed by having my nose rot off.' Then the other takes the *ndeko* stick, and performing the same ceremony calls down the same curse on himself should he ever break the covenant." A palm-frond is then taken and split, and one part is placed across the path between the two towns that have entered into the above contract of friendship. "This is not only a sign that all past palavers are finished, but is also a fetish to punish anyone who breaks the treaty. It is firmly believed that the side that renews the quarrel will get the worst of it by wounds and death."⁵ The effect of this rite of blood-brotherhood on the Upper Congo has been to stop all feuds and to cause the parties to it to act in all respects as blood-relations. "I have again and again seen a disturbed district," comments Weeks,⁶ "where during several weeks there had been much fighting and many killed, quiet down directly the headmen had made blood-brotherhood. All the important men of the district had many cicatrices on their arms indicative of the frequency with which they had performed the ceremony."

Such mixing of blood is practised by most negro-peoples. Three light dagger-wounds are made on the lower arm, and the blood, drunk along with palm-wine, makes the participators blood-related—they have, as a West African negro chief expressed it, "two bellies but only one head."⁷ Again, the two prospective blood-brothers sit on a hide with legs interlocked and a third party brandishes a saber over their heads anathematizing the one who should break the bond. They kill a sheep and the new brothers, after sprinkling it with blood from cuts in the pit of their stomachs, eat it. Or they may mix blood with oil or butter and rub it into each other's cuts. It is an amelioration of primitive savagery.⁸ In the Gaboon region there is a friendship-sanction between two men called fetish-giving. "The whole body of inhabitants collects for it, and in the presence of all a kola-nut is divided among the friends, whereupon a fetish-man makes an incision in the arm of each of the two. Into the spurting blood are dipped the halves of the nut of which each eats one, after he has uttered an imprecation, laying a curse on all who might do harm to the friend or his family. . . . Then the almond chewed by the friend is laid on the arm of his friend, the wound of the one rubbed against that of the other, and a feast seals their intimate brotherhood, which is like that of blood-friends in Montenegro."⁹

Brunache¹⁰ exchanged blood with a native, to find later that it was proposed with the idea of getting more presents. Junker¹¹ and an African chief

established blood-brotherhood by each having a drop of blood drawn from the pit of the stomach, then wiping each other's blood off on the end of a piece of sugar-cane, chewing the cane, and spitting the fibers upon the pit of each other's stomach and necks. Hereupon each stated the essential reasons for the establishment of the relation, which must be adhered to as under oath. Each of these points was emphasized by adding: "And if thou dost not so, may my blood kill thee," and by having a third person hammer with a stone upon some convenient object at each repetition. There is something of the ordeal-element in this case. To accomplish a certain plan satisfactorily it has often been necessary to contract a treaty, offensive and defensive, with the natives, and nothing would suffice for this but a mutual interchange of blood—a "barbarous, but truly African custom."¹² Only by such means could a basis for mutual confidence be attained. Even when a blood-brother had committed a crime, his life must be preserved at all costs, or the magic would take effect and produce a painful death for the delinquent friend.¹³ The motive of utility of course dominates: by establishing blood-brotherhood, one assures himself of support in need, and also secures an avenger of blood.¹⁴

Roth¹⁵ quotes a full and variously significant description of the ceremony as presented by a man who went through it: "Selgie requested I would make *sobat* with him; on my gladly consenting, he went in person and stuck a spear into the ground above his father's grave. This being the signal for a general assembly, each of the chiefs sent a person to know the Rajah's pleasure; it was that every warrior should assemble around the grave by twelve o'clock the next day. Some thousands were present; a platform of bamboo was raised about twelve feet above the grave, and on this Selgie and I mounted, accompanied by an Agi, his high priest. After some previous ceremony, the Agi produced a small silver cup, which might hold about two wine glasses, and then with a piece of bamboo made very sharp, drew blood from the Rajah's right arm; the blood ran into the cup until it was nearly full; he then produced another cup, of a similar size, and made an incision in my arm, a little above the elbow, and filled it with blood. The two cups were then held up to the view of the surrounding people, who greeted them with loud cheers. The Agi now presented me with the cup of Selgie's blood, giving him the other one with mine; upon a signal we drank off the contents amidst the deafening noise of the warriors and others. The Agi then half-filled one of the cups again from Selgie's arm, and with my blood made it a bumper; this was stirred up with a piece of bamboo and given to Selgie, who drank about half; he then presented the cup to me, when I finished it. The noise was tremendous; thus the great Rajah Selgie and I became brothers. After this ceremony I was perfectly safe, and from that moment felt myself so during my stay amongst his people. Drinking the blood, however, made me ill for two days as I could not throw it off my stomach. The Rajah took his share with great gusto, as this is considered one of the greatest ceremonies, particularly on this occasion, between the great Rajah and the first European who had been seen in his country. Great festivities followed and abundance of heads were brought in, for nothing can be done without them. Three days and nights all ranks of people danced round these heads, after being, as usual, smoked and the brains taken out, drinking a kind of toddy

which soon intoxicates them; they are then taken care of by the women who do not drink, at least I never observed them."

The same author relates the experience of another traveller as follows: "The following was observed on my initiation into the brotherhood with Lasa Kulan, the chief of Balaga on the Rejang, and of Tubow on the Bintulu river. Two days previous to that on which the bloody affair came off, the great hall of the chief was garnished with the weapons and gaudy skin war dresses of the men, and dashed with a fair sprinkling of the finery of the women kept more for show than use. On the day appointed, a number of the neighboring chiefs having arrived, several of them commenced proceedings by haranguing on the greatness and power of their own selves, and of all the wonders they had heard of the white people, and of their satisfaction in being visited by one of them, of whom their fathers had heard so much but had never seen. Next a large pig, provided for the occasion, was killed, the throat cutting part of the business being performed by one of the fair sex, seemingly with great satisfaction to the attendant crowd of men. Next were brought three jars full of arrack of three sorts, severally made from rice, sugar-cane, and the fruit tampui. In pieces of bambu it was dealt out in profusion to all present, the ladies excepted. On the chief taking a bambu filled with arrack, we repaired to the balcony in front of the house, and stood side by side, with our faces towards the river. The chief then announced his intention of becoming the friend or brother of a son of the white man, on which one of the attending chiefs gave me a small sharp-pointed piece of bambu, with which I made a slight incision in the fore-arm of the chief, and the blood drawn out was put on a leaf. The chief then, with a similar instrument, drew blood from my left fore-arm, which was put on the same leaf and mingled with the other. The blood was then mixed with tobacco and made up into a large cigar which we puffed alternately until it was finished, when my new friend delivered himself of a long and eloquent speech, invoking their god Tanangan, the sun, moon, and stars, and rivers, the woods and mountains to witness his sincerity. Three times during this declamation he sprinkled the arrack on the ground towards the river. My speech being delivered, several of the principal chiefs present held forth both long and loud enough. We afterwards returned to the hall, and the cheering beverage went around more merrily than before, calling forth their good nature and social disposition. Although no toasts were given, still each successive bumper was accompanied by a merry and noisy chorus. The feast came afterwards, and the whole affair was wound up by music and dancing which lasted until about midnight." In the case of the smoking, Hose¹⁶ comments, "the smoke is inhaled into the lungs in some cases, to show the sincerity of the bond." Roth¹⁷ cites several other cases of the brotherhood-ceremony in Borneo, exhibiting attendant religious performances which, though partially illustrated in preceding cases, belong under oath-sacrifices.¹⁸ In Formosa, "I, of course, was made to pledge friendship in the orthodox savage fashion, by putting our arms round each other's necks, and mutually drinking, at the same moment, out of one basin."¹⁹

The Scythians, Lydians, and Armenians drank blood or mixed it with wine, as did the knights of the Middle Ages. The Vikings and Germans formed

16 In JAI, XXIII, 166.

17 *Sarawak*, II, 207, 208.

18 §277 of text.

19 Pickering, *Formosa*, 164; Wirth, in AA, X, 363.

such friendships; in the latter case the blood was mixed with beer, later fingers were put in the beer instead, and finally it survived only in the expression, *Brüderschaft trinken*.²⁰ Sworn brotherhood was till recently very frequent among the South Slavs. In Montenegro it has not carried blood-relationship, so far as intermarriage is concerned, nor has the bond been ratified by exchange of blood; in North Albania, however, it still carries full blood-relationship, and blood is exchanged when taking the vow.²¹

Guest-Friendship. A custom probably related to guest-friendship is the selection by the Loyalty Islanders of special friends from amongst strangers with whom they are connected by mutual good offices. "These are called *enehmu*. The *enehmu* feels bound to provide food and lodging for his friend when he visits him, and will assist him in any way he can, when he needs it, and in return expects the same good treatment when occasion offers."²² The Melanesian custom of guest-friendship, however, is best seen in connection with trade. In some places the merchant would not dare to land unless he had at the place a guest-friend, to whose house he goes. Here he sits on a mat and is given a piece of betel, part of which he gives back, the motive being the same as drinking together to avoid being poisoned. At night the trader does not stay in the house of his guest-friend but goes to the shore to sleep. Some townsmen come to keep him company as evidence of goodwill. The host protects the guest from the plots of enemies.²³ Conditions of hostility and suspicion toward strangers are thereby modified so as to permit some intercourse and trade. Among the Papuans the peace of the market together with guest-friendship make trade possible. In the trade between villages each family has its special business-friends with whom it is in touch and whose right of hospitality it enjoys during the market time. The market is said to be the most important factor in the social life of the Papuans and to be conducted under rules and agreements which recall the modern commercial treaties of European nations.²⁴ In Southwest Africa trade is possible only through the practice of guest-friendship.²⁵

Guest-friendship is a recognized custom among the Bedouins,²⁶ while in India the ceremonial friendship established especially between women taken in marriage from different villages is regarded as a matter of tribal necessity.²⁷ To the Hebrews it was enjoined: "The stranger that sojourneth with you shall be unto you as the homeborn among you."²⁸ Among the Phœnicians, "before the departure of the guest they take a potsherd and break it into two pieces. The one half is taken by the stranger, the other kept by the host. If he wishes in future to recommend anyone to the care of his former protege, the former takes from him on the journey the half he has retained as a mark of identification. At presentation they try whether the fractured edges of the two pieces fit together, and the conveyor is accredited."²⁹

"A series of words [for instance, those connected with *hostis* and *hostia*], which in milder times have assumed the meaning of 'guest,' 'guest-friend' undoubtedly in primeval ages had a more sinister and threatening meaning. It

was at an early age the conviction that the stranger did continue to be *exlex* [outside the law], 'but that the divine ordinance (*fas*) made it a duty—more and more recognized as a human law (*jus*)—to protect the life and property of the stranger, and to receive him as a guest at the sacred fire of the hearth.' The institution of guest-friendship is by no means confined to Europe, but is found all over the globe, and in the most widely separated stages of culture . . . and is nearly always bound up with the exchange of gifts between host and guest." It was a device to make commerce practicable and safe in the absence of public protection, and probably the Phœnicians found the early Greeks "at least partially accessible to strangers with whom it was their interest to trade."³⁰ This quotation would seem to intimate that the custom took its origin in religion. That it was supported by the gods even before it became a recognized human "law" is entirely probable. Here is only a case of religion sanctioning the mores;³¹ the custom was already there, for obvious reasons of expediency. Some of these reasons will appear in the following final and extraordinarily complete example of the practice.³²

The Homeric Greeks were moving toward a more humane type of warfare and also to guarantees outside the bounds of the circumscribed tribal group. "Toward this end one of the chief contributors is a body of traditions and usages connected with strangers, suppliants, guests, and guest-friends: Since the stranger became at once a guest, and since a guest was forever afterward a guest-friend, this body of ideas and practices is appropriately called guest-friendship. Where syngenetic feeling is strong, 'stranger' means 'enemy'; it had no such signification to the genuine Greek of Homer's time. The stranger, at his arrival, was at once addressed as *xēinos*, and welcomed with fine courtesy; only the deepest domestic troubles led to neglect of strangers. No questions were asked until the newcomer had partaken of food and drink, and thus identified himself with the host and his interests; for when men had taken food and drink together, their 'brotherhood' was symbolically established. Strangers were welcome to feasts and sacrifices, were made participants of them, and were given the places of honour—all this before their identity was known. Menelaus is represented as feeling great irritation at the idea of sending strangers on to some other host; he felt and expressed his sense of reciprocal obligation for the hospitality extended to himself during his own wanderings. During his stay (and his departure must neither be hastened nor delayed against his will), the stranger must suffer no harm—that would be a shame to his host; while he remained, it was not in accordance with *dikē* that the guest should suffer lack of anything his host could provide, and at his departure he was presented with valuable *xenia* in remembrance. In short, every liberty and privilege was granted to the stranger within the gates; he was cherished as a brother by the right-minded man.

These guests were not always persons of noble birth; any one who 'came' was welcome, though of course ancestral friends were most heartily received. Beggars were classed directly with *xēinoi*; the disguised beggar Odysseus was honoured with the best food, and reverence was paid to his age and misfortunes; when he spoke of departing so as to relieve his host of the burden, the

host, a poor swine-herd, was incensed at the thought and bade him stay on. Guests were often suppliants; this type of man was generally a fugitive, fleeing from the relatives of some tribesman whom he had slain, intentionally or otherwise. The suppliant sought the protection of the hearth's sanctity, was regularly received as an unfortunate, treated with the utmost kindness, and, if brave and of good birth, often became a *hetairos* [companion] to his host's son. The terms suppliant and guest are used together frequently; in a certain sense every guest was a suppliant to his host, in those days. The suppliant, however, was generally in some plight that required considerable aid; he was a special sort of guest.

"Such extended hospitality, such unguarded trust in a perfect stranger, is remarkable in any age of the world; a host virtually placed himself and all his at the will and mercy of his guest. He must have felt great faith in some strong guarantee which safeguarded the integrity of this relation. Such a guarantee was afforded in all needed strength by the heavy religious sanctions which rested upon all the relations of host and guest. The proper conduct of the host, as well as his duty of receiving the guest, was strongly emphasised by the gods; they might go about in disguise, observing the actions of mortals to see if they treated their guests rightly. Though the majority of divine injunctions had to do, naturally enough, with the reception and respect to be accorded to strangers, still the guest's conduct also was prescribed. No right-minded man would consent to surpass his host even in athletic contests, much less to steal his property. An oath by the host's table or hearth was a sacred one. It is not hard, therefore, to understand how a violation of this host-guest relation could bring on a Trojan war. Menelaus prayed to Zeus, as he took part in the ordeal-trial, for victory, in order that the rights of hosts might be upheld; in another place he speaks with contempt and wrath of those who rob the man who is entertaining them. The host had, then, strong religious sanctions to warrant his unguardedness. Doubtless his mind was satisfied in the belief that the gods would render his risks secure, and it never occurred to him to ask for a more rational explanation of his own hospitality. Any evidence as to the origins of this guest-friendship must be given by Homer unconsciously, if at all. The presence of the religious sanctions in such number and strength indicates that the birth of the host-guest relation took place in the more or less remote past; this is witnessed to also by the completeness of the relation's development. Apparently the origins of guest-friendship lay in the reachings-forth of a developing people toward an advance and toward a further and larger acquaintance with a world of greater material wealth and luxury than their own; that is, the hospitality and love of guests so characteristic of the Homeric Greek were another product of the contact with the higher Eastern civilisation.

"The tribes of the Iliad and Odyssey, and their immediate ancestors, lived in a prosperous and populous culture-stage of combined cattle-raising and agriculture; conditions of life were such as to leave the lords of the people, if not the people themselves, free from the most grinding needs and from the enervating alternation of satiety and want. Settling in a land little suited to a continuance of nomadic life, and brought under the direct influence of the high civilisations of the East, attention was turning to other ideas and pursuits than those to which the earlier tribesmen had been attached—to the sea and to commerce, that is, to the outside world. The people were eager to learn, and men were their only books; a stranger, who, if he were not himself a Phœni-

cian, could yet describe the wonders of those magical foreign lands, was a rare treasure to an isolated community. People came to be very fond of entertaining, and gladly accommodated another man's guest in his absence. One man is mentioned who had a house on the public road and entertained every one who came; a man was the more respected for entertaining freely. In time the real practical value of the relation became more and more apparent, and Zeus became the guardian of strangers, who were the heralds of the time's advance. Eagerness for news, for tales of the exterior world, its people and doings, is marked; it is characteristic of an energetic, isolated community. Whether guest-friendship is to be regarded as an institution of more than local importance or not, its origin seems to have been taken from a period several centuries earlier than the Homeric age, and to have been due chiefly to the quickening contact with an older and more polished civilisation. The Greeks identified the customs of guest-friendship with civilisation and culture. Examples of dishonour of guests are connected with the cannibalistic Cyclopes, the Læstrygonians, and other such crude beings and monsters; it is only lawless and violent men who carry on such practices. The Suitors turned strangers away by their treatment of them and suggested their sale into slavery. As for the Cyclopes, it is noticeable that they were especially godless, violent, and syngenetic; against their deeds appeal was made to Zeus Xeinius. As the Cyclops Polyphemus devoured the companions of Odysseus, he and his men held up their hands to Zeus; and by the aid of Zeus the monster was blinded. Besides these lawless tribes, the Trojan Paris, and the Suitors, some of the *ancient* heroes were guilty of breaches of the host-guest relation, notably Heracles; for he slew one to whom he had offered the hospitality of his table,—a terrible crime. The best evidence to show that the kindly relation, between host and guest was the gauge of a people's civilisation is given by the shipwrecked unfortunate; the first question of such an one as to the people among whom he is thus thrown, is: Are they just? Are they godfearing? Do they respect strangers? These qualities are contrasted with rudeness and injustice.

"From the reception of the stranger and the hospitality accorded to him arose an enduring relation, guest-friendship proper. After eating and drinking together, the two parties stood in a close mutual relation, which was strong enough to endure for generations; the reciprocal duties and rights of the parties were made permanent. A strong sense of mutual good-will was engendered, the gifts at the guest's departure standing as a symbol of the bond and not suffering its memory to fade; the importance of these gifts as symbols is shown by a case where gifts alone established the host-guest relation, although the parties were never to enjoy each other's hospitality. The once established relation afforded to each of the parties and to his children a special sponsor in a strange land, a land where otherwise he could claim no acquaintance; the obligations descended upon the houses of the respective parties, in the death or absence of the original guest-friends. Such an ancestral relation was particularly holy and strong, and treasured in the traditions of the family. Mutual visits preserved the bond, and consequent diffusion of knowledge, tending toward amalgamation of ethnic elements, was among the results.

"A further form of this bond is not unparalleled in ethnography; for it resembles closely the system of 'brotherhoods' common elsewhere. It has been stated that eating and drinking together established a sort of brotherhood; in time of war such brothers were expected to perform certain services for each

other. A guest-friend was bound to make all effort to rescue the dead body of his *xéinos* for burial, and sometimes a prisoner was ransomed from slavery and set free, with gifts, by a guest-friend. Ancestral guest-friends would not contend in battle. On the plain of Troy, Glaucus of Lycia and Diomed of Argos met for combat; before they fought, Diomed asked his opponent his name and ancestry. Glaucus, with the usual race-pride, gave his genealogy in detail. Hearing this Diomed exclaimed: 'But you are an ancestral guest-friend of mine; we cannot fight. Let us avoid each other in combat, and exchange armour as a symbol of our relation.' This they did, with mutual pledges. The instance witnesses for many features of guest-friendship: the care with which its traditions were preserved in the family, the detailed knowledge of a guest-friend's ancestry, the symbolism of gifts, the mutual sponsorship.

"The many advantages of this relation of guest-friendship need scarcely to be indicated; one of its greatest services was of course to the traveller. Without this free hospitality, travel would hardly have been possible; the wayfarer could not take a band of retainers to defend him and forage for him, nor could he take with him cattle or treasure, with which to pay his bills. The host acted as defender, food-provider, banker, sponsor, escort; *all* the needs of the traveller were his host's to supply, from bath and bed to conveyance on sea or land, and all these duties were willingly discharged for the sake of the reciprocal claim upon the guest. Diomed witnesses to this in the passage to which attention has been called: 'So now I am your dear host in the midst of Argos, and you mine in Lycia, when I visit that people.' Within range of this custom, therefore, travel became possible and not very hazardous, and so arose diffusion of culture and mutual knowledge; the barrier of tribal narrowness was falling, for the stranger was a *friend*. And when we find that some such relation was recognised in Phœnicia and Egypt, its far-reaching importance in the education of Greece becomes still more apparent.

"The stern safeguarding of the integrity of this relation would follow almost instinctively upon a realisation of its value. Public and private, and probably local and national, interests, would here unite. It has been shown that desire for vengeance upon a perfidious guest was the prime motive of the Trojan war; whether the allies of the injured Menelaus were led to fight the Trojans for his (and Agamemnon's) sake alone, or whether, as appears more probable, a personal interest in the integrity of the violated relation roused their resentment,—at any rate, without guest-friendship and its anti-syngenetic power, such a united movement would have been impossible. Agamemnon and Menelaus enlisted their guest-friends by the story of the latter's wrongs, and in the wideness of the circle of their well-wishers and acquaintances lay the success of their undertaking. Such a united movement as the Trojan expedition, for which more than 29 peoples, 1100 ships, and (according to the ancients) about 100,000 men, mustered at Aulis, is a veritable wonder under a non-despotic government, even if large discounts be made from these estimates. Genghis Khan or Tamerlane might have been proud of it, and yet the expedition was a union of politically independent peoples. The mutual need of acquaintance, of security in travel and business, of external, stimulating communication, projecting itself upon the body of *mores* in the form of guest-friendship, was the most powerful factor in this great result. Such an aggregation of allies was hardly held together for so extended a period by allegiance to one or two kings, however rich and powerful. The element of personal service is not infrequently

brought out, both by the chiefs and by Menelaus; still it seems that the allies were, in general attitude, less eager to aid the *king* (Menelaus or Agamemnon) than to aid an injured host to vengeance upon a treacherous guest and his whole tribe. The feeling of the allies had more than allegiance in it, and from the *ensemble* of the *Iliad* it appears that the evident thirst for vengeance (and for booty, of course) considerably out-weighs any expressed desires of serving the sons of Atreus. The whole force of public opinion supported the expedition in a manner which indicates a collective aim to avenge an attack upon a collective possession; the integrity of guest-friendship was certainly a far more vital matter to all Greece than intertribal alliances were to the separate tribes, though the latter are found to have been of high local importance.

"There remain several cases of guest-friendship which exhibit peculiarities valuable as throwing light upon the system, though they were not necessarily regular phases of it. Among the Phæacians, Odysseus, though the guest of Alcinous, was, by the latter's command, the recipient of gifts from each of the sub-kings. The donation seems to have been a state-function, for the people finally paid for all the hospitality of these princes. The host of Odysseus in Crete also had recourse to taxing the people to pay for his generosity; from them he collected the grain which he gave to his guest. Further, in Phæacia, the king and assembly provided Odysseus with conveyance to his native land, jointly; elsewhere the guest was a purely personal burden or acquisition. The presents received by the guest were an important feature; tours were sometimes a means of collecting wealth. Odysseus waited for the Cyclops's return to his cave in order to get a gift, and asked for it in a matter-of-fact way; thus he seems to have done elsewhere. He delayed a long time among the Phæacians in order to collect property, and was regarded as clever for so doing. Menelaus offered to take Telemachus the round of the Achæan cities, assuring him that no one would deny them presents; a guest was urged to stay and get a valuable present at departure. Guest-friends were also valuable in a business way; we are told that Ithaca was too stony and mountainous for the raising of horses and cattle, and elsewhere we find that the horses and cattle of the Ithacans were pastured in Elis and on the mainland. There *weinoi* of Odysseus and his own herdsmen cared for them; evidently arrangements of this kind were common between *weinoi*, which led to mutual advantages and benefits. Guest-friendship thus reaches out into all the phases of social life; whether it was an institution or not, it was a tangible, vigorous, social factor, and its importance at that stage of civilisation is scarcely to be over-estimated."

§153. Embryonic Government.

In Australia each clan was autonomous and managed its own affairs by means of a camp-council. In every clan there was some one man who was regarded as the leader or head-man; his position was not hereditary, but was filled by a sort of informal election.¹ "There is no one to whom the term 'chief,' or even head of the tribe, can be properly applied; but, on the other hand, there are certain of the elder men, the heads of local groups, who, at any great ceremonial gathering . . . take the lead and superintend matters. They form, as it were, an inner council or cabinet and completely control everything. . . . The old

¹ Brown, in JAI, XLVIII, 231.

men take absolutely no notice of the younger men, preserving their own counsels in the most quiet and dignified way possible."² "It is found that in most respects there reigns a communism, the liberty of the individual being limited by severe laws and customs which have developed through ages, and which every one without difference is obliged to obey. They accord some privileges to the older people, which are equally open to anyone who has attained a certain age."³ "One man is as good as another. Great respect is shown to old men, and whatever authority is acknowledged is centered in the aged, because of their years. All matters connected with social affairs are settled in open council at night, when each man speaks from his camp in turn, and is listened to uninterruptedly. Young men and boys do not join in the talk."⁴ "Only in cases of major offences, murder, incest, physical violence, etc., is there an application of any code, and that in the form of the Mosaic one. The old men and elders act the part of 'bosses,' 'kings,' 'judges,' etc., in influencing aboriginal public opinion in these matters of enforcing domestic policy; a ripe old age constitutes the highest social status in the camp, and the one calling for the greatest respect. There is no single individual chief to direct affairs."⁵

While there is no tribal chief, a family has a head "whose duty it is to keep order and settle any differences that may arise between the members of the household" or with those of any neighboring group. The head-man investigates jealousies and ensuing fights, acting "judicially and executively. He determines who is at fault, and he chastises him." The rest keep out of any such affair, for it is the head-man's business to control disputes and "whatever he does is right."⁶ "The oldest man is head of the totem, and has authority in it as such, but this authority does not extend to any other totem besides his own. Though he is the oldest man, he does not necessarily have the greatest influence and authority in his totem; in other words, he is head of his totem because of his seniority, but not necessarily head man unless he shows some superior qualities fitting him especially for that position."⁷

In spite of the absence of any definite organization there exists among such primitive peoples the not inconsiderable control of custom, as evidenced in the following two instances.

Among the Australians, "under no circumstances is fighting of any description whatsoever allowed in camp at night, and the whole crowd collectively will see that no infringement of this rule ever takes place: if people want to fight, they must go outside, and, when necessary, kindle fires to see by." After a fight the victor must show to the elders that he had a grievance or he has to submit to the same mutilations by the vanquished as the latter received. When the women fight, it must be according to rule; each has to submit to a blow on the head from the other—and they use heavy sticks four feet long—without defending herself, alternately, till one gives in.⁸ It is a fundamental rule in the Congo region that people shall appear at the palavers without weapons.⁹ The Teda must bear no weapons in the village.¹⁰ "Despite their sanguine temperament and great activity, the Tungus yet live for the most part in harmony and peace amongst themselves; one hears vituperation and cursing ex-

tremely seldom. Injuries and strifes commonly have as a consequence a knightly duel which is fought out after due preliminary challenge according to all the rules of the art."¹¹

Wallace¹² tells of a community of about five hundred people of various races, all met in a remote corner of the East "to look for their fortune," as they express it. They are most of them people of the very worst reputation for honesty as well as for every other form of morality—Chinese, Bugis, Ceramese, half-caste Javanese, with a sprinkling of half-wild Papuans—yet all goes on very quietly. "This motley, ignorant, bloodthirsty, thievish population live here without the shadow of a government, with no police, no courts, and no lawyers; yet they do not cut each other's throats, do not plunder each other day and night, do not fall into the anarchy that such a state of things might be supposed to lead to. . . . Here may be seen in its simplest form the genius of Commerce at the work of Civilization. Trade is the magic that keeps all at peace, and unites these discordant elements into a well-behaved community. All are traders, and all know that peace and order are essential to successful trade, and thus a public opinion is created which puts down all lawlessness." If this case can be credited, and it is certainly upon high authority, it is one where naked public opinion is seen operating without intermediary agencies, under the stress of a clearly visualized interest.

The regulative system of many of the Melanesians is rudimentary. In British New Guinea the politico-social unit is the small community, in the majority of cases too small and of too little permanence to be called a tribe. In some districts true villages are found where there are hereditary chiefs possessing real authority, "which differs greatly both in quality and extent from the comparatively slight influence possessed by old or important men throughout the greater part of the area under consideration."¹³ Among the Mekeo clans there was a feeling of affectionate consideration for their "chiefs" and a "ready recognition of the pre-eminence of the families to which these chiefs belonged." This fostered a sense of dignity, importance and responsibility on the part of the chiefs which is quite uncommon among Papuasians. "There are no big chiefs either at Milne Bay or Tubetube, nor are there even clan chiefs or heads of clans in any definite or executive sense. There were not even war chiefs, but merely leaders of individual war parties. . . . Certain men were, however, recognized as 'big' or important. In every case these were oldish men and their importance had not, as it appeared, come to them from their maternal uncles, their high repute being largely due to the prominent part they took in feasts. The fact that such men would readily be credited with some knowledge of magic, would increase their reputation and cause their opinions to carry weight in the councils of the old men. Further they were usually rich men, who had in their time bought many canoes and traded, i.e., travelled, extensively, or were known as specially successful fishermen." Although there is no chieftainship at Wagawaga there is "an elaborate system of distribution and division of food, which ensures that much of the best food obtained by members of the community falls to the share of the old men." There is no dominant or paramount chief of the Koita, or of any group larger than a section. Each clan has its head-man, called *iduhu rohi*, who enjoys little real authority. "The *iduhu rohi* is in charge of and is responsible for sharing out

¹¹ Hieckisch, *Tungusen*, 68.

¹² *Malay Archip.*, 439-440.

¹³ Seligmann, in JAI, XXXIX, 268-269.

the food at the feasts. He takes an important part in determining when these shall be held. . . . Though they may, and often do, exert considerable influence in their *iduhu* [clan], they have no power to enforce their desires against the general sense of the older men of the *iduhu* who represent public opinion. . . . The *iduhu rohi* also exert their authority to keep the peace in the village, and to mitigate friction between the clans. Captain Barton ascertained, that if a man beat or otherwise maltreated his wife, the case would be referred to the *iduhu rohi* who would reason with the man. 'In the event of the man declining to listen to advice, the *iduhu rohi* washes his hands of the matter, and the result in the old days was a general row and fight between the woman's relatives and the man's—other people also joining in.' Further, questions concerning land are formally brought before the *iduhu rohi* even when there is no quarrel or disagreement between the parties concerned. . . . *Iduhu rohi* have certain rights to game killed by all the men of their section, as well as rights in all large fish caught, though the latter rights are less well defined or perhaps more often ignored."¹⁴ In the Loyalty Islands "there is no distinct division of the people into tribes. People related to one another generally preferred to live together in the same locality under the rule and direction of one of the older members, who was called the *Joxu* or chief." Sometimes this person was called by another term, meaning "father," the other members of the family styling themselves "children."¹⁵ In D'Entrecasteaux there is "no all-powerful chief to sit in judgment. The *kauwea* or head man of a hamlet has only the influence which a man of years and experience is sure to command everywhere, but of actual recognized authority over his people he has none. It is not he who decides the disputes and quarrels but the rival parties themselves, aided at times by mediating friends; and only the fear of social ostracism compels compliance with the general will. Usually, therefore, the owner is forced to take the law into his own hands and inflict a summary vengeance on the thief."¹⁶

A considerable range of governmental development may be found in Africa, varying from the more primitive tribes to the kingdoms of Uganda, Dahomi, Ashanti, and Benin. The latter will be considered later. The primitive tribes vary in social status from those who recognize no chief and are still in the patriarchal stage, lacking any but the most rudimentary communal organization, up to those with well-defined tribal institutions, till they merge into the second class of more advanced communities. Among the most primitive the family is the unit and even the village-head has but little authority.¹⁷ It is with such groups that we are concerned at this point. Among the Akamba "it is only rarely that individual chiefs have any great power and with the exception of presents of beer their people pay them no tribute. The real power is vested in the council of elders and they generally get their way."¹⁸ In East Africa "the elders within one district would meet pretty regularly and try the cases of their locality. How far they could extend their authority beyond a very limited district is doubtful now; if there was hostility between the districts of accuser and accused legal proceedings would be useless, and on the other hand, doubtless many of the former feuds arose just where one party refused to acknowledge all legal authority; in either case redress would be

sought by force of arms."¹⁹ Among the Atheraka the elders form a judicial council identical with that of the Akamba; these elders perform priestly functions at sacrifices. Chiefs, as we understand the term, are non-existent.²⁰ Among the Mombasa "in each hamlet the elder is practically supreme, though almost powerless beyond its stockade. The community is governed by a council of all its notables, in which the will of the majority is sovereign."²¹ The system of government found among the Ba-Mbala is extremely elementary; it has been described as "communism with a strong flavouring of anarchy." The unit is the village community, at the head of which is a "chief" who holds that position by reason of his wealth in slaves and wives. Upon his death the power devolves upon the individual who comes next in riches; there is no form of election. No tribute is paid to him, but he has several privileges, including the right to receive: (a) the ribs of every man killed for food, and (b) a hind leg of each beast slain during the common hunts. "His principal duty is to lend money to his 'subjects' when they have incurred fines which they are unable to pay, and, consequently, are in danger of becoming slaves."²² Among the Bangala, who lacked paramount chiefs, the word of the head of the family was law to that group and to his own section of the town. These headmen met together to talk over town affairs. "Some were heads of larger families than others, and were richer than others. Such men necessarily had more influence, and their words carried greater weight than the words of poorer and smaller men. Sometimes a man with a loud voice and dominating will would get weaker men to follow him."²³ The Dinkas are a mere congeries of independent tribes; they have never been welded into a nation. "Every village governs itself by means of the village elders, and the chief is merely the leader in petty raids or in the equally petty and desultory wars resulting from blood-feuds. He presides, it is true, at the deliberations of the 'old men,' and appears to be the principal executive officer of the village or division of the tribe, but the real power is vested in the general body of the 'old men.'" The tribal system of self-administration is by "courts" of the "old people" of each village or clan. "These 'old people' are not elected, but are held to be qualified merely by the fact of old age, as having the best knowledge of tribal traditions and customs and the way to direct matters and settle disputes. It is the 'old people' of two quarrelling sections who arrange for peace and settle the terms. The sheikh is not the judge or lawgiver of his section. He is the leader of the warriors and acts as president and spokesman of his court of advisers, 'the old people.'"²⁴

The principle of seniority holds sway among the aborigines of Siberia, not only in the family but in the settlement. In the latter, as long as no stronger man appeared, the founder was considered the elder, seniority implying superiority not only in age but also in physical strength. An eighteenth-century traveller says of the Chukchi people that they "have no chiefs or authorities. Each community has a man who is richer than the others, or who has a larger family; but he also is little obeyed and has no right to punish anybody." The important factors in the development of the regulative system among the Yukaghir were the "old man," the shaman, the "strong man" with

his warriors, and the first hunter with his group of inferior hunters. "As a rule the oldest man of the clan was the 'old man,' but in some cases the ablest elder was chosen. In all important matters, the 'old man' of the clan consulted the oldest representatives of the separate families . . . who constituted a council, and by whose advice the 'old man' was not infrequently guided. His wife held a similar position among the women, although the powers of government were in the hands of the 'old man,' whom both men and women must obey. She superintended the division of the spoils of the chase. The shaman's position was of almost as great importance as that of the 'old man.' . . . The duty of the 'strong man,' with his warriors, was to defend the clan; neither he nor the hunter was necessarily of the same blood with the consanguineous part of the group." Through these factors the inner and outer groups in the clan were assimilated. In the natural Gilyak social organization there is no trace of a despotic authority. The "old men" of the clan decide questions of cult and clanship, for they are the repositories of the clan customs, traditions, and genealogies; apart from this they have no great influence or real authority. All the clans have some men who, either through wealth, physical prowess, or some accomplishment such as oratory, have an important though unofficial standing in the clan. In time of need such men may be called upon to assume the responsibility of upholding the customary law; but the clan as a whole has supreme authority over them.²⁵ Among the Soyots, reindeer-nomads of the upper Yenesei, each tribe has a head, chosen for a term and removable by a united public sentiment. His rule seems to be rather despotic, but the only luxury he has is to "drink himself full nearly every day."²⁶

Though it is doubtful whether the Todas of southern India have as a whole any true chief, it is clear that the clan and its divisions often have definite leaders. Each clan has a headman and also an informal council of the chief members who settle matters arising within the clan. Over the affairs of the Todas in general is another and more formal council. In addition to its functions in disputes between individuals, which arise chiefly out of the custom of transferring wives from one man to another, the council had wide functions in connection with Toda ceremonial.²⁷ In British India, in general, there are communities grouped together in a village, generally owning land in common and dealing with other villages as units; but in Malabar individual property is universal and the village-organization comes in only for specific purposes such as the management of the temple-affairs and, in olden days, for military training and mobilization. Among these people custom and public opinion exert an enormous influence and are the real factors of regulative control.²⁸ In many groups in Assam the head-man is almost entirely without direct authority in secular matters; he is rather the religious head and many taboos surround him.²⁹ The petty chief of each Sakai village has every right but the capital one over the members of his settlement. "His authority is enforced (like that of the father of a European family) by means of the influence derived from his age and position in the tribe, rather than by that of any legal sanction. The tribe, in fact, merely forms (as it were) a rather larger family circle." The political and administrative organization of the Negritos is, like that of the Sakai, exceedingly simple; in each village there is a functionary invested with

full powers, who is called by the Malays "Penghulu." "These Penghulus are all of equal standing, and own no superior. . . . Complete equality exists as between individuals, and caste is unknown. Even the chief is on an equal footing with his men, except when in discharge of his official duties. To the foregoing it should be added that all their property is in common."³⁰

Among many of the Polynesians the form of government is found to be similar to the Australian system: "a democracy, or rather an oligarchy of old and influential men, who meet in council, and decide on all measures of importance, to the practical exclusion of the younger men. Their deliberative assembly answers to the senate of later times." The Marquesas Islanders cannot be said to have lived under any form of government other than a patriarchal one. "The oldest man of a tribe, if he possessed the most land, and was the owner of the most bread-fruit and coconut trees, was the most influential among them. Wealth . . . gave power. They also had rank which was hereditary, and took much pride in tracing ancestry. . . . The class of chiefs was in Polynesia the wealthy class, even though a chief of high rank and great possessions might sometimes, owing to misfortunes, become quite poor. Perhaps writers on the Marquesas have imagined that men could become chiefs because they were rich, whereas really they were rich because they were chiefs." In Easter Island "there was hardly a distinction observable between the magistrate and the subjects. They (that is, the magistrates) had the name and the dignity, and some attendance, and were, on the arrival of strangers, better dressed; but their authority was more like that of a benevolent parent than the imperious dictates of a king."³¹ The authority of a Tanna chief "did not seem to extend a gunshot from his own dwelling." In a settlement or village is a population of eighty to a hundred and one or two principal men among them who are called chiefs. "The affairs of this little community are regulated by the chiefs and the heads of families."³² This primitive governmental system was later upset in many parts of Polynesia through war, which divided the population of some of the islands into victors and subjects, nobles and commoners, and chiefs and kings arose who exercised dominating power.³³ The social organization of the Maori tribe of New Zealand was "as wellnigh perfect a commune as can be imagined. It was communism almost pure and undefiled; a common-wealth in which practically all had equal rights—except the slaves, who were not of the tribe, but had been taken from other tribes in war. . . . The autocracy of the chiefs was really a nominal one. The Maori commoner considered himself as good as his lord or *Ariki* in most points. If a chief lost the respect of his people, his place as leader in emergency, such as war, could be filled by others. What he could not lose was his sacred *Ariki*-ship, which was vested in him by heredity. The real ruler of the people was the institution of *tapu*."³⁴

Among the Point Barrow Eskimo, "there is no established form of government and there are no chiefs, but the people appear to be ruled by strong public opinion combined with respect for the opinions of older people, both men and women, and by traditional observances such as those concerning whale fishery. . . . In the ordinary relations of life a person avoids doing

anything to another which he would not care to have done to himself, and the affairs of the community in general are settled by a majority, after an informal discussion. The majority apparently has no means, short of individual violence, of enforcing its decision, but the matter seems to be left to the good sense of the parties concerned."³⁵

We are told of the Aleuts that they have no government, but that the old men are deferred to. Whalers and medicine-men have some influence.³⁶ One of the Yukon tribes has "no chiefs, guides, or masters . . . every one commands and all obey if they see fit." Public opinion is the dominating and direct control. An injured person—their three crimes being murder, theft, and adultery—is authorized to punish.³⁷ Farther south, "in the sense in which the term is ordinarily used, there is no absolute chiefship. The family is the sociological unit. The head of that household in the village, which, through inheritance, wealth, numbers, and influence, predominates over the others, is nominally chief of the village. His authority is shadowy, and his power is largely due, aside from wealth, good birth, and family influence, to his prowess in war, or to personal and masterful qualities."³⁸ Among the Salish of British Columbia "each local community had its own headman and looked after its own affairs. In the earlier history of the Stock this local authority and direction of affairs would seem to have been shared by all the eldersmen of the village or commune in common; or perhaps it would be more correct to say that the eldersman of each family directed the affairs of his own household independently of all others; for the original social unit of Salish society was the family not the village commune. A primitive Salish community was a congeries of independent family groups, each ruled and directed by its own eldersman."³⁹

There was, in Oregon, "a marked tendency to local segregation of groups related by blood in every village. These consanguineous divisions often attained considerable size."⁴⁰ "The social organization of the Takelma was almost the simplest conceivable. Each village . . . and the villages were generally very insignificant, was entirely independent or practically so. Any one who was comparatively wealthy could be called a 'chief,' . . . there does not seem to have been a recognized head chief, though in time of war some one man probably was so considered. . . . It seems then that the local village community is the only purely sociological grouping to be recognized among these Indians, excluding the nearly self-evident ones of rich and poor, freemen and slaves . . . and the family."⁴¹ Powers⁴² calls the tribes of northern California "democratic," meaning that they had no political organization. The tribal organization of the Pawnee was based on village-communities, each village having its hereditary chief and its council composed of leading men.⁴³ Among the Eastern Dakota each gens had its own group of twenty councillors, and in the tribal camp each councillor's tent was pitched in front of the place occupied by his gens. On all occasions except when in tribal council the chief had no authority over the councillors. This rather advanced political organization was due, some of the older Dakota believe, to French suggestion.⁴⁴

Of the Botocudos it is reported that there is no connection between their

clans. Ten or twenty families form a cluster.⁴⁵ "The Lengua natives rule their lives almost entirely by public opinion;" the chiefs are rather "fathers of the family" than political functionaries.⁴⁶ Among the Jibaros of Ecuador "each family father is theoretically absolute ruler over his house people, and in times of peace there is no recognized common chief even within the tribe, and still less any exercising authority over several tribes. . . . It is only in times of war that a chieftainship exists; . . . such a temporary chief of war is generally only called *unta*, 'the old one,' because the chiefs are nearly always old, experienced men who have killed many enemies and captured many heads. . . . As soon as a war has been carried to a successful end the power of the chief ceases, and he has, in spite of the great repute he always enjoys, no more authority or right to decide over the doings of his tribesmen than any other family father among the Jibaros."⁴⁷ There was no political organization, as we understand the term, among the Araucanians, and save only in times of great national peril, and then only in a military sense, did they recognize any supreme chief. "The danger over, they returned to their former customs, the functions of the chief ceasing from the moment the army was disbanded. The basis of their social and political life is the family, which develops into a clan, and afterwards a tribe, absolutely independent one from the other." The clan was governed by the head of the family; the authority of these family-heads was little more than nominal, and was confined almost exclusively to the direction of their feasts and ceremonies, and in a lesser degree to the political economy of the group. All important matters were treated in common council by the adult males, the chief presiding at the meeting. "No tribute is paid him, neither is he exempt from sharing the daily tasks of the clan, although in a general way he assumes the management."⁴⁸ Among the lowly Fuegians, on account of their wandering life, scarcely any political organization seems necessary. Generally they move in groups of about twelve—three men, five women, and four children, probably related. Their sorcerers have been mistaken for chiefs.⁴⁹

To these contemporary instances there might be added historical cases, a number of which are covered by the statement that "the most ancient forms of government amongst Indo-European peoples are based on the organization of the family."⁵⁰

§155. The Chieftainship.

WAR has been a powerful factor in the development of chieftainship, and some evidence of its influence in this respect should be given before considering the functions and powers of the primitive chief. In Australia and New Guinea the rudimentary chieftainships are founded more upon intelligence, strength, and wealth, and exist in fact rather than in law. "In the Bismarck Archipelago we see brave people with powerful personality move forward . . . to leadership in war and they appear also in peace as judges of quarrels."¹ On the Solomon Islands, wherever a warlike state of things prevailed, the chiefs won power and importance.² In New Ireland, "there are chiefs of important reputation

and greater power than in New Britain, and just for this reason, that the New Irelanders are much more warlike than the New Britons and need leaders for their incessant feuds."³ A chief may further his son's claims to succession by teaching him his own special knowledge, often magical, by buying him a high position in the secret society, and by leaving him property; but after all the test is competence. "If a man has no son competent he may take his nephew; sometimes, the son perhaps being too young, a chief's brother will succeed him; sometimes a man will set himself up when no successor is acknowledged, or the people will choose some one to lead them."⁴

The Zulus have a remarkable military organization and a highly centralized government. Their great chiefs sacrificed the family to the state, forcing their warriors to put off marriage until their military service was discharged. The father is lord of his family and owner of his wives, and the king is father of his people. The king has a monopoly of all trade. Even here, however, the chief has two advisers (*indunas*) and the government is sometimes called a triumvirate.⁵ Among the Guinea negroes there is "a regular military organization, with a regular War Lord, not one and the same with the Peace Lord."⁶ A West African king "may be blamed if a war he has declared ends disastrously";⁷ that is, the non-discharge of his war-function in so far imperils his position. Junker's⁸ account of the largely disintegrated nations of the Sudan, compared with the Zulus, for instance, goes to show that the authority of the political chief is weak in the former cases, but rises to extremest despotism at home when a military ruler makes conquests and establishes an even rudimentary state.

The Pygmies own no territory, but settle on the land of some chief, "a tacit bargain being usual that they shall remain there unmolested on condition that they give their military assistance to him when he may be engaged in warfare. . . . As all these people are in a perpetual state of internecine warfare, the aid of the Pygmies is no small factor in the army of the chief under whom they live, nor are they a negligible factor in his domestic diplomacy."⁹ Among the Berbers, the only exception to organization in "little republics" is where there has been need of defense either against the outsider or in the presence of a subjected element whose aspirations for independence had to be suppressed. Then a monarchical form has developed.¹⁰ The state of warfare thus enables the chief to consolidate his power. Where every man is a soldier and there is a standing army of police, these are also body-guards for the king.¹¹

"The more unstable peace is, the more stable and the greater is the power of these [Western Asiatic] tribal chiefs. Among the predatory and warlike Karakirghiz they appear even in peace as almost unlimited despots."¹² In Siberia "the 'strong man' in modern times is simply a man of great physical strength, daring temper, and adventurous disposition; but when the Chukchee were frequently at war with the Koryak, Eskimo, and Cossacks, the 'strong man' was the hero, as we see in the extant primitive Chukchee war epic."¹³ Among the Bhils of India we see a very rudimentary form of government. "Let us draw in rough outline a history of the *Social Contract*, more truthful

than Rousseau's; let us reproduce in broad lines the establishment of political and civil administration. A roistering blade, a fellow with a clear head and a heavy hand, espies a rock commanding a defile between two fertile valleys; there he takes up his position and fortifies it. This man in possession falls upon the passers by, assassinates some, pillages and despoils the greater number. Having the power, he has the right. . . . The institution of robbery, which is not at all what a vain folk have imagined, gives birth to property and the police. Political authority, which was quite recently given out to be an emanation of Divine Right, and a good gift of Providence, was constructed little by little by the care of licensed highwaymen, by the systematic efforts of brigands who were men of influence. The police were formed and educated by ruffians who prowled about the outskirts of the forest, armed with a knotted cudgel, and shouted to the trader, 'Your money or your life!' Taxes were the subscription, the premium paid by the robbed to the robbers. Joyous and grateful, the plundered placed themselves behind the knights of the highway, and proclaimed them the supporters of order, of religion, of the family, of property, of morals; consecrated them a legitimate government. It was a touching contract."¹⁴ In the Siamese language "to govern" is the same word as "to steal."¹⁵

Among some of the Central Polynesians "the man who rendered himself most formidable by warlike deeds" was the man of greatest consideration. In ancient times the ruling power of Niue was held by the fighting men, and the party that happened to be in the ascendant elected a king to be their mouth-piece. "It was a dignity that cost its holder dearly, for the object of the opposition party was invariably to kill the king, and a violent death had come to be so often an appanage of royalty that for eighty years before the introduction of Christianity, and the consequent cessation of warfare, no one could be found willing to undertake the office." Conquest in a number of places divided the population into the two groups of conquerors and conquered and enhanced the power of the chief.¹⁶

Some tribes of American Indians had a war chief whose duties pertained exclusively to war;¹⁷ while among the Jibaros it was only in times of war that a chieftainship existed.¹⁸ As in other tribes of Guiana, every settlement among the Makusi had its headman; in times of peace "he never gives his orders in a dictatorial sense, but in such a manner as, 'Would it not perhaps be better for this or that to be done?' In battle, however, he is absolute commander."¹⁹

Among the Arabs the sheikh possesses no great power over the members of his tribe but can make his personality felt. His commands may be treated with contempt, but his advice is generally followed. If war rises an "aegy" is put at the head of the troops, but his function ends when the raiders get home. He possesses as little coercive power as the sheikh. But "if the aegy is a man of extraordinary bravery and keenness he retains, even in peace-time, a great influence over the affairs of his tribe."²⁰ The Hebrews at first did as they chose, though they had in the Levites a theocratic class. Then judges tried to establish a hereditary rule, and finally kings—Saul and David—came out of war.²¹

Cæsar²² says the Gauls had no common magistrate in time of peace, but in wartime authorities, with power of life and death, appeared. In Poland there was a governor or judge, who was old and selected for wisdom. Beside him there appeared a warrior-chief, or Voevoda, named for the time.²³ The system is like that of the sachem and war-chief of the Indians. The assembly of kinsmen of the South Slavs meets and debates; it is mainly the old men who talk. "It should always be remembered that if the association were habitually militant, both the old men and the youths would probably fall into the background, and the authority in council would belong to the mature warrior who is foremost in arms."²⁴

The extent to which chieftainship is developed, among various groups of primitive peoples, the functions and authority of the chief, tests of the chief, and other customs related to chieftainship are indicated in the following ethnographical survey. It is highly desirable to mass evidence of all description upon the nature of the chieftainship—to view it from all sides—because it and its incumbent stand in a sort of focus not only of political life, but of societal evolution in general.

In central Australia "there is no such thing as a chief of the tribe, nor is there any individual to whom the term chief can be applied." But there is a head-man with somewhat vague prerogatives; and if he has the personal ability, he can "wield considerable power not only over the members of his own group, but over those of neighboring groups whose head men are inferior in personal ability to himself." This position is hereditary in the male line rather than elective; and the main function of its holder is as custodian of the store of sacred objects belonging to the group.²⁵ Smyth²⁶ lists the men of position as the doctors or sorcerers, who sometimes get supreme power; the warriors who in time of trouble are absolute masters; the dreamers, "who direct and control the movements of the tribe until their divinations are fulfilled or forgotten"; the old men, or councillors, whose advice weighs even with the warriors; and the old women, "who noisily intimate their designs." Some man from some one of these classes becomes the principal figure of the tribe and the young men, undistinguished elders, women, and children accept his leadership which is exercised "only in such manner as the old men and the sorcerers and the dreamers have agreed to approve." In West Victoria, "every tribe has its chief, who is looked upon in the light of a father, and whose authority is supreme. He consults with the best men of the tribe, but when he announces his decision, they dare not contradict or disobey him. . . . Great respect is paid to the chiefs and their wives and families. They can command the services of everyone belonging to their tribe. . . . Should they fancy any article of dress, opossum rug, or weapon, it must be given without a murmur."²⁷ From such accounts, even though the agreement of authorities is not always perfect,²⁸ it is plain enough that the chieftainship has not become a settled institution in this part of the continent.

The power of the chief in the Solomon Islands depends on birth, wealth, and magic; if the chief orders the people to work, they will do it or not do it; if

they refuse, he can say nothing. "The activities of the chiefs had mostly ceased with head-hunting."²⁹ In the Loyalty Islands, on the other hand, "a chief's orders would be implicitly obeyed." He directed the disposal of property and controlled marriage; some foods were especially reserved for him, and in early times he could order the killing of his subjects for his own food. "Persons were careful not to crack a coconut so as to startle or disturb a chief. Special words were used when speaking to him, or about him."³⁰ Among other Melane- sians we find war-chiefs, chiefs who are expert in battle-magic, and clan-chiefs who settle minor quarrels and otherwise regulate the affairs of the local group.³¹

One South African chief attached young men to himself by distributing wives among those who could not afford them; they became strong and faithful vassals. Other chiefs by this system established an enormous economic system based on the harem.³² But alongside such concentration of power there appeared also in South Africa very loose bonds between ruler and subjects.³³ The chief, even in Africa, may be criticized by his people; one orator said of his chief that he was getting too fat, which proved that the public interest did not worry him. And the speaker invited the assembly to look upon the person of the chief and see if it were not so.³⁴ The tribe, in one case, selected the chief wife of the ruler and presented her to him. Her son would be heir to the chieftainship to the exclusion of the children of his purchased wives. "This marriage is usually recommended and seen to by the tribe when the chief is getting on towards middle life."³⁵ Among some South African tribes the chief is credited with the power of rain-making and has other priestly functions.³⁶ There are certain well-recognized rights of the Bechuana chief: he alone has the right to order the great tribal ceremonies; he has the power of taxation and of administering justice; he alone can summon the civil assemblies and the armed assemblies, and declare war. "He alone has the power that pertains to a 'doctor,' and all who act as medicine men in his country do so by his permission and exercise the power which he has delegated to them." Moreover, there are two things which are peculiarly his prerogative: the felling of a special kind of tree for building a cattle-kraal, and the castrating of calves. "These two prerogatives strike one as being unworthy of the chief; but they are connected with cattle, and if the chief has inherited them from a time when the cattle were the totem of the tribe, and his ancestors priests of the totem-god, then there is nothing paltry about them."³⁷

In the Congo region, "the chief is, as a rule, the head fetish-man." The great chief is assisted by a council consisting of all the fighting men; he may retire behind a confidential adviser, who is often a slave of great importance and impersonates the chief before strangers.³⁸ In East Africa, "everywhere the political sovereign was the supreme judge, whether that dignity was represented by an individual or a council. And for this reason the native will always regard the European judge or magistrate as his immediate ruler, wherefore a distinction between judicial and political officials dealing directly with the people of Africa is never to be recommended. The effectiveness and supremacy of the law depend mainly on the stability of the tribal organization: it is most

lax among the disorganized tribes, and most telling among those who are united under individual and powerful rulers. Therefore, it is necessary to consider jointly the political organization and the judicial system of each tribe. . . . In general it may be said that where chiefship was not known or hardly existed, it has developed under European rule, and where it was most firm and absolute it has declined."³⁹

There is a Dinka legend about a powerful chief who seems to have had considerable intellectual curiosity along with his masterful disposition. He wondered where the sun went at night, having heard that it descended into the water and yet seeing no water toward the west. He sent some men to journey westwards and find out the truth of the matter. After he had been gathered to his fathers a few aged and battered members of the expedition returned to report that the sun did actually descend into the ocean. When asked why they had not returned before, they replied that they did not dare come back unsuccessful in their quest to face the anger of the chief "and the laughter of their sisters."⁴⁰ There was another enlightened chief in East Africa, named Nedia: "When Nedia saw that his people would die of starvation, he said: 'Let me go out and be killed [by the besieging enemy], that my people may live'; and he and eight of his elders came out and were slain. Nedia ran some 400 yards before being killed. He fell at the foot of some rocks, where his descendants to this day sacrifice annually to his spirit. . . . The following is one of the best-known stories told of him; . . . Nedia had a rooted objection to witchcraft, and to all who practised it, and to convince his elders of the absurdity of their belief in them, he one day hid his copper bracelets in the grass, and then accused them of having stolen them." These bracelets were the symbols of royalty. "They denied the theft and Nedia therefore sent for a witch doctor, who administered the potion given at trials by ordeal. The elders drank it, and one and all fell down insensible from the effects of the drug. The following day Nedia took the witch doctor and the accused men to the spot where he had hidden the bracelets, and showing them to the witch doctor ordered him out of the country, saying that he would not countenance such practices any longer."⁴¹

The West African king is sometimes subjected to a test of flogging prior to his elevation. "If he should cry out during the punishment, or show any signs of pain, he is at once rejected as unworthy, and the council makes a new choice; but if he bear himself bravely, without flinching, he is forthwith crowned. This ordeal appears to be designed to test the candidate's capacity for endurance, and his power of self-restraint and concealment of thought." In Sierra Leone they "scoff at and beat the new king while dragging him from his own house to the residence of his predecessor; where, if he has withstood the ordeal, the royal ornaments are put on him."⁴² In Dahomi "the king is absolute, his will being law, and he is subject to no control whatever." When the king dies all law and order cease; anarchy prevails and there is no more safety for person or property. The laws die with the king, so closely identified are they with him. The despotism of the West African rulers, and at the same time the political cohesion of the tribes, are weakened in proportion as individuals get rich through trade. Any man becomes independent who can acquire a gun and powder. There comes about a state of affairs where nobody will accept the

kingly dignity because he will not submit to the ceremonies. The last Congo kings lie unburied and the government is still carried on in their name.⁴³

A strange procedure in West Africa is where chiefs are not properly buried, but kept "hanging about outside life, but not inside death; the reason for this seemingly unprincipled conduct in not properly burying the chief, so that he may be reincarnated to a complete human form, lies in the fact that he would be a political nuisance to his successor if he came back promptly; therefore he is kept waiting." But the new chief goes to the house of the dead one and tells him the political news. The so-called House-system of the Gold Coast allows the poorest boy who paddles an oil-canoe a chance to become king. Though the kings of Benin are little more than puppets in the hands of their chief officers, yet they could designate their successors from among their sons. "Now begins trouble for the non-successful claimants; the king's throne must be secure, so they and their sons must be suppressed. It was not allowed to shed royal blood; hence they were quietly suffocated by having their noses, mouths, and ears stuffed with cloth."⁴⁴ It is rather exceptional for the village king or chief to have great power; he seems to act mainly as a judge and mediator in quarrels.⁴⁵

Klose⁴⁶ plainly sets forth the close relations of the chiefs, or "kings" and the fetish-men; the former often depend upon the latter. And the chiefs maintain a close connection with their dead predecessors; the chief's dead father has always a house in which gin, tobacco, clothes, and other property are kept for his use.⁴⁷ In the Congo region political organization is but feebly developed; "he is chief who has the most wives, children, slaves, pirogues, and particularly who has boldness to carry on transactions with the whites in the best interest of the tribe."⁴⁸ The natives, however, have great respect for force and totally despise gentleness.

That the king is a fetish-man admits of no debate; we seek to complete his picture here, even though we partially anticipate a later topic.⁴⁹ In Loango no king is legitimately installed until he has visited a certain sacred region. Again, a king may never quit his house or even his chair, but must sleep sitting; if he were to lie down no wind would rise and navigation would cease. A king is crowned amongst the corpses of his predecessors, and is so surrounded with taboos and inhibitions that he must be forced to submit to coronation. One prince, whose rule was characterized by unrelatable atrocities, always went armed lest he be overpowered and made king. "After a family council has determined in secret who the next king is to be, the latter is suddenly seized and thrown bound into the fetish-house, to be held there as a prisoner till he acquiesces." In other places, the king has to buy his position by presents and must endure preliminary humiliations. The priestly kingship is in force in all of Africa, and the chief is reputed to be lord of rain and weather. "In Loango the king is accused of having a bad heart . . . if they cannot fish because the

surf is too heavy, and they depose him because he has no love for his subjects."⁵⁰

The chief is almost always under some check and surveillance; he cannot bid defiance to public opinion by systematically crossing the interests of his subjects. Even so low a people as the Teda of the Sahara seek to protect themselves against royal oppression. In one of their sub-tribes are two royal families, the oldest male representatives of which succeed one another in turn. The one succeeding must give up his property lest he be able to buy many slaves and oppress the people through them. The chief has no power of life and death and raises no taxes; he is only judge and military leader.⁵¹ In the Sudan the legitimate chief "is often enough set in the shadow by the intelligence and efficiency of a superior tribesman who then is willingly recognized as actual chief. . . . Further the chiefs can assert themselves only in council or in war-raids. . . . No head-man has the power to judge alone, and the more disruption results in separated groups without connection in the country, the more does each man seem to steal, calumniate, and do wrong, so far as he can bear the consequences, and the more is the injured party thrown back upon getting justice for himself."⁵² The Kikuyu chief always had his people absolutely under his thumb, supplied all the arrow-heads used in hunting, and received all the tusks gathered. He also had a sugar-cane press out of which he derived considerable profit. In this region the biggest chief lives in a mud hut like anybody else.⁵³

The king of Uganda had seven thousand so-called wives. His popularity and power depended on providing his great men with wives, and these probably represented his stock. Elsewhere too wives are not bought but a man gets the king or some magnate to give him one.⁵⁴ A chief must, in some cases, inspect the grain and decide upon the time of harvesting.⁵⁵ In some cases the chief is hidden away and his place taken by an impersonator.⁵⁶ In Somal and Galla tribes there is no central authority, but the chiefs, who are also the only merchants, rule petty divisions for a time, generally eight years.⁵⁷

As among all Bantu peoples, all through the Batetela country land is vested in the chief for the benefit of the tribe. The great chief, assisted by elders, governs through a prime minister; in all sections the chief administers justice, and a great part of his revenue is derived from the fines which he inflicts.⁵⁸ The Bahima chief has representatives or head-men from each clan to assist him in government; clan matters are decided by the respective head-men, while the chief attends to cases involving clan against clan.⁵⁹ Certain kings of East Africa are not allowed to die a natural death; should they become too old to rule, or should they fall sick beyond recovery, they are strangled. The funeral celebrations of the dead king are very similar to those of the common people, but the manner of his interment is quite different. "The corpse is wrapped in the hide of a newly slaughtered bull and buried in a sitting position in the chief wife's hut, with the head above ground. A tube for sucking up beer leading from an empty beer pot is stuck in the mouth, and an inverted bowl is placed

over the head." Later the bones are deposited in the burial-place of the kings. The king is a semi-divine personage; he is first and foremost a priest or medicine-man; one of his chief functions in olden times was to make the war medicine. Among other East Africans the privileges of the chief consist in free labor and a contribution of foodstuffs. More nearly paramount was the position of the king in Ungoni. "He exercised powers of life and death and to a certain extent had a right to his subjects' wives, in that he could dissolve any marriage and appropriate the woman thus divorced. Yet he was distinguished only by the greeting accorded to him; his only source of wealth was the booty brought to him by his warlike people. . . . Judgment is delivered by the chief with the acclamation of his councillors. The decision is rarely enforced, but if the losing party defied the chief he was formally killed or enslaved. Under all circumstances, however, the claimant had full right to seize what he laid claim to of the defendant's property."⁶⁰ Priest-kings are common to the Turkana, Masai, Nandi, Wagogo, and are found in a number of cases in the Sudan.⁶¹

The East Central African chief is in a sense divine; his first duty is hospitality and he must never turn a wayfarer away. He must be generous to men in high rank who visit him. Yet he must not be too exacting in demanding presents from the people to replenish an exhausted exchequer. Just how he is to reconcile these duties is not stated. His first official act is to appoint a chief magician who is to be the confidential minister of state.⁶² The Somal and neighboring tribes obey the commands of their chiefs, but with many an evasion upon plausible pretext. They do not respect them very much, nor do the chiefs conduct themselves with much dignity toward their subjects, though they display authority with impressiveness in dealing with strangers. There is a sort of double-chieftainship where two weaker tribes unite.⁶³ The Madagascar chief has the right to turn out a tenant at his pleasure, without warning and without compensation for improvements; to refuse permission for a tenant to give up, exchange, or shift his holding; to have his permission asked before doing anything with the land beyond building or planting.⁶⁴

Among the Mongols worship at the tomb of his predecessors took the place of the chief's coronation. They believed that anyone who refused to recognize the still-existing authority of the sainted Genghis Khan would speedily be punished by him.⁶⁵ The Dnieper Cossack tribes lived each in a "saitch" or fortified camp, as pictured in Gogol's *Taras Bulba* and Sienkiewicz's *Fire and Sword*. Each clan had a common dwelling in which lived five hundred or more persons. Any member might become clan-chief and any clan-chief might be the tribal chief, or *Atamán*, for a year. "Bear patiently, Cossack; you will one day be *Atamán*!" After his term of office the chief became again a simple Cossack.⁶⁶ The Karakirghiz and Kalmuks endure, by exception among the Asiatic nomads, a despotic chief, who controls their property and is an unlimited judge. But generally "the economic need of the herders holds, with its centrifugal tendency, the preponderance over the centripetal tendency of their warlike disposition."⁶⁷

Chiefs in India have to submit to burdens and taboos like those reported of the kings of Egypt, "to whom only two kinds of flesh and a limited quantity of wine were permitted. The government is "distinctly democratic"; chiefs are "without much individual power and their rule is based on the general approval of the clan." There is no settled form of government. Nominally the tribesmen are "under the orders of the headmen of their different villages, who are chosen for wealth, bravery, skill in diplomacy, etc. Virtually every man does that which he considers right and is a law unto himself. The orders of the headman are obeyed in so far as they accord with the wishes of the community, but the minority will not hold themselves bound to act by the wishes of the majority. The Naga headman is simply *primus inter pares*, and that only for a time." Theoretically every man is his own master and avenges his own quarrel.⁶⁸ Among the Sema Nagas the chief is father and protector of his subjects, who are termed "orphans"—frequently being broken men, debtors, etc., who have attached themselves to the chief. The relation is partly patriarchal and partly quasi-feudal. The chief distributes his land among his villagers and gets in return a certain number of days' work. To abolish this system would necessitate provision for a large number of paupers.⁶⁹

In the country of the Lhoosai, "the author one day standing in the path in a village, saw a drunken man stumbling along. The writer and a chief were talking together, but as they were somewhat in the way of the drunken man, he seized the chief by the neck and asked him why he stopped the road. The explanation given by the chief concerning this disrespect was that on the war-path or in the council he was chief, and there such behavior would be punished by death, but that there in the village the men were equals."⁷⁰ "When the village consists of a number of loosely aggregated cultivating occupants, it is very natural that they should choose or recognize some one of their number to be their headman"; but in the landlord village "the proprietary families were too jealous of their equal rights to allow of any great degree of authority residing in one head"; they managed village affairs by a council of family-heads.⁷¹ The Nairs provided against having a senile chief by limiting the term to twelve years. The chief then presented his successor and stabbed himself. This provision occurs elsewhere, for instance, in Africa.⁷²

In the Semang tribes of the Malay Peninsula the office of chief medicine-man appears to be generally combined with that of chief, but among the Sakai and Jakun these offices are sometimes separated.⁷³ "The dual kingship, as in Siam, on the Pelew Islands, and elsewhere, is to be regarded as a sort of transition from the priest-kingship to the complete separation of secular and spiritual power, while elsewhere the displacement comes through the commander-in-chief under the crown."⁷⁴ The manangs or medicine-men of the Sea Dyaks rank next in importance to the village-chiefs, and it is not unusual for the medicine-man himself to be the chief of the village in which he resides. In the interior where the Dutch resident's appointing power is not in evidence, "cunning, wealth, valour, honesty, knowledge of the ancestral regulations, integrity, and impartiality are qualities by which a man may command claims to the dignity of chieftainship. . . . The government of the Dyaks seems to be administered more

by general consent than from any authority lodged in the chief. His power, indeed, is one of persuasion, and depends upon his personal ability, nor can he in any way coerce his people to obedience."⁷⁵ He settles all disputes among the inmates of the long village-house, and decides the amount of the fine the guilty party has to pay. Great deference is paid him and the people generally abide by his decisions.⁷⁶ The Chinese settlements in Borneo had the system of a village-patriarchate, which revealed the sentiment of the village-dwellers that they were all of one kin. "The patriarch is the central point, the core about which the whole village is built, the heart out of which all the arteries branch, the knot into which all the bonds that tie together the villagers, run together." Respect for parents and the aged unites them all.⁷⁷

In Sumatra the government is monarchical only in name. The ruler is chosen by a council and is only president of it. Princes care for nothing but the fines which they levy arbitrarily upon the rich and noble, who recoup themselves by plundering the people.⁷⁸ Yet Sumatra has had her heroic ruler, one who combined tact and firmness and brought Atjeh from a low condition to one of great prosperity. He was "cruel and of a very irritable character that tolerated no opposition and above all no injustice."⁷⁹ The Philippine chiefs attained their offices by valor or inheritance and held territory in proportion to their valor.⁸⁰ The Moro *datto* Pedro Cuevas was an escaped convict of high courage who attained chieftainship by his valor and by killing his predecessor. His despotism was absolute, and he had the fierce Moros in complete subjection. Any objection to orders was met with: "Cut off his head!"⁸¹

The government of Nukuoro resembles that once existent in the Tonga Islands, in that there are two heads, a secular and a religious. The former office descends from father to children regardless of sex, and the chief selects his successor. The other chief heads the priesthood and has to do with religion only, but to all appearance he is the object of more respect than the secular chief. Succession is rapid, being in favor of the oldest man among the people, even though he is not a priest and must first be initiated. The secular head—in the case reported, a woman—has the same rights as anyone else and moves without distinction among the people; no one needs to bow to her or render gifts, and she has to earn her living along with her family like all the rest. But as soon as a secular chief begins to function as such, he has absolute power, which he wields in connection with certain religious ceremonies. He has the taboo at his disposal, but must use it according to custom. "He may not impose or raise the taboo capriciously, and the exercise of it has either a religious, that is, less understandable, sense, or aims at an obvious utility for the society. For instance, no breadfruit trees may be felled for canoe-building without asking permission of the chief, who must be paid for every tree which he assigns." The chief also initiates the religious festivities that usher in the harvest; and he has a monopoly of all turtles.⁸²

On the island of Yap, "the chief of the village has no right to punish, but only the over-chief"; but even so only in certain cases and on appeal; "so he does not mix himself *ex officio* in the affairs of his subjects, neither in the matter of property-law nor of criminal law. There is therefore no general gov-

ernmental criminal court, but the proposition stands: Where there is no plaintiff there is no judge. It is each Yap-native's own affair to get justice for himself and to gather the evidence for it."⁸³ On Chatham Island "they had no hereditary rule. The best fisherman or bird-catcher or one who distinguished himself over others by several superiorities was regarded as leader."⁸⁴ On Tahiti the people used to hide their possessions when the king and queen were to come by.⁸⁵ The chief in the Marquesas did not have much respect paid to him; the people were equal among themselves; they had not reached the Tahitian degree of civilization, and difference of rank did not take place among them. No particular honor was paid to the king, whose preëminence appeared only in his dress. In the Tongan Islands, the Hervey Islands, and elsewhere, there were both sacred kings and secular ones; while in Samoa certain great orator-chiefs were regarded as semi-divine, as they were the preservers of the traditions and genealogies and were consulted as diviners with reference to all important decisions. In Tahiti the highest civil and sacerdotal offices were united in one person; the king was generally chief priest of the national temple, and on many occasions of worship he was the representative of the god. Priestly duties were as commonly performed by the chiefs in different parts of Polynesia as were economic and general administrative affairs.⁸⁶

The following facts are culled from the lengthy and painfully detailed work of Williamson⁸⁷ on the social and political systems of Central Polynesia. In the Hervey Islands there were three great offices: those of the secular head-chiefs, of the "rulers of food," and of the sacred or praying chiefs. The first were warrior-rulers, whose selection and succession depended upon victories; the rulers of food attended to the economic needs; the sacred chiefs warded off, by means of rhythmical prayers of great antiquity, evil-minded spirits which might injure the island. The secular chief had to obey the sacred one; even in case of war, the latter had to offer human sacrifices beforehand and terminate hostilities by beating the drum of peace. "It sometimes happened that the temporal lord was at enmity with the king of his day. In that case the king would refuse to complete the ceremonies for his formal investiture; life would remain unsafe; the soil could not be cultivated, and famine soon followed. This state of misery might endure for years, until the obnoxious chief had in his turn been despatched." If the religious chief would not beat the drum of peace, the shedding of blood would continue indefinitely; "after the beating of the drum of peace, on the other hand, it was unlawful for any one even to carry a weapon, or even to cut down ironwood, which might be used for making weapons. . . . In Tonga the office of the sacred king . . . was distinct from that of the secular king, . . . though the legends suggest that at one time the two had been united." The former was hereditary, the latter subject to the vicissitudes of war. The author cites many cases where there was no separation or an indication of former union. "The Polynesian chiefs as a class, claimed and were accorded an inherent element of sanctity, the more important of them being in some islands credited with actual divinity or something closely approaching it." The author has a chapter (XXX) on the connection between the sacred and secular offices, showing all degrees of connection.

87 I, 252, 254, 256-257, 418-421; III, 32-33, 45-46, 53-54, 55, 87-88, 97-99, 189-192, 207, 210, 211, 212, 213, 396-400.

"I think the evidence is sufficient to justify us in believing that the head of a social group, large or small, the holder of its title or name, was recognized widely as its natural priest." It is recorded that "in Tonga the priests knew that the existence of their order depended upon the union of church and state, and that their oracular utterances . . . were always directed to upholding the privileges of the chiefs. Between the two orders there was a thorough understanding. The chief saw that the regular offerings to the spirits were not stinted; the priest, possessed by his god, retained sufficient self-command to gasp prophecies in remarkable accordance with the chief's interest. . . . The king stood at the head of all the chiefs on the one hand, and of all the priests on the other; consequently these two bodies supported their common head, while he protected and aggrandized each in return, to secure his own ascendancy." This last case refers to the Society Islands, where the secular and religious functions were united; similarly in the Marquesas Islands, "the political authority blended with the sacerdotal, and the government became perfectly theocratic. . . . Any marked division between the political authority of the chiefs and the religious authority of the priest was rarely seen. . . . In the island of Niue . . . a perfect understanding existed between priests and petty chiefs, to their mutual advantage, for the chiefs could not afford to ignore the political influence of the priests, and the latter, knowing that a chief could invoke a god without their aid, realized that they were not indispensable."

Williamson takes up somewhat the character of the chief. "Just as in Melanesia a man . . . became a chief by virtue of the belief that he was possessed of *mana* derived from a spirit; so in Polynesia, with its theism, his holding of his high office may well have been based upon a belief as to his supernatural powers derived from the gods, and his power of approaching the gods, learning their wishes and intentions, and assuaging their anger and securing their help by sacrifice and prayer." The author concludes that such a chief had first both secular and religious functions, but later handed over the former to others, or lost them for some reason, and devoted themselves to the gods. It is recorded of a king of Hao Island that he possessed very great virtue or power (*mana*). He had a large body and could hold four men's heads in his hands. He knew what passed everywhere, for his evil spirits told him. Thus a powerful frame was interpreted as a spiritual gift. "The French missionaries say that the chief of the island carried their catechist Murphy on his back from the shore to his house; and their explanation is that the people believed from his [Murphy's] greater bulk, as compared with that of the other missionaries, that he was a chief." They probably suffered some disillusionment when Murphy turned out to be an underling.

"The subject of the powers of the chiefs has to be considered from more points of view than one. There was their political power in connection with the general administration and control of the internal affairs of the areas or peoples over whom they ruled, and their power relating to external matters, including such questions as those of peace and war. . . . Much would depend upon the character, ability, personality and conduct (good or bad) of a chief, as displayed both in dealing with his own subjects, in external political enterprises and intrigues, and in war; and upon the corresponding qualities of those who might oppose him. . . . Their position as the heads of social groups over which they ruled would in itself give them the power possessed in a greater or less degree by the heads of all groups, great or small. . . . The amount of con-

trol over his subjects that rested with a man who could himself, or through the mouth of a priest, announce to them the wishes and intentions of the gods must have been great. There was also the supporting power of cursing" and that "of controlling food supply and of imposing a taboo, which also had a supernatural foundation. This power was in some cases used by chiefs for the benefit of the community, . . . but it was also used by them as a means of enforcing their authority, . . . of punishing those who had offended them, and in other ways for their own personal benefit. . . . On the other hand, the subjects of the chief had, . . . at all events in some of the islands, a means of defence in their power of deposing a chief who was guilty of misrule, or of excessive oppression of his people." The author gives a number of examples of deposition, in some cases involving a death-sentence; one instance represents a chief as being deposed because he showed himself "too authoritative, exacting, greedy and cruel"; again, because of a practice "of waylaying children and taking their fish." In one case, after a deposition, a tribe is said to have lived afterwards without a chief.

Among the Maoris there was "no proper form of government. A republic with leading men, or an oligarchy with a very large aristocratic class, partly describes the system. It was not a republic because the rights of heredity and of primogeniture were enforced; it was not an oligarchy because every free man was a member of the council. There was no king; the chief was head of his tribe, and when several tribes united for war, the best fighting man was made leader. The Ariki was the first-born of the elder branch, the head of the clan, priest as well as chief. To him descended the high ancestral knowledge, the command of the most potent charms and spells, the right of precedence everywhere. If the first-born was a female, she received the title of Ariki. . . . She was very powerful in the tribe, though being a woman she had not all the privileges, could not lead in war, lift the blood-*tapu*, etc. . . . The power of an ordinary chief in peace time was not great; and, however influential, he could not *compel* the men to do anything—he really had little authority except over his own family and slaves. The Ariki who could *tapu* the whole place or fleet was a power, and any chief could *tapu* a thing by naming it after himself, his head, etc., but if a stranger or greater man came along he could break the *tapu* of the lesser with impunity."⁸⁸

The shaman was at one time the most highly revered person among the Tlinkits; next to him in station came the chief. "The chief is not only respected by all classes in his community, but throughout the entire country, no one daring to give him umbrage except one of his own class or rank. . . . None of a lower rank is allowed to build so large a house as his, or give a greater pot-latch." The chief has the ruling voice in the adjudication of all affairs involving the tribe.⁸⁹ The Tsimshian chief seems to have been able to wield almost autocratic power, provided his personality was strong enough. "The chief has to carry out the decisions of the council; more particularly, he has to declare peace and war. His opinion must be asked by the tribe in all important events. He decides when the winter village is to be left, when the fishing begins, etc. The first fish, the first berries, etc., are given to him. It is his duty to begin all dances. He must be invited to all festivities; and when the first whistles are blown in winter, indicating the beginning of the dancing-season, he receives a certain tribute. People of low rank must not step up directly to the chief,

⁸⁸ Tregear, in JAI, XIX, 112, 113.

⁸⁹ Jones, *Thlingets*, 61, 62, 201-202.

whose seat is in the rear of the house, but must approach him going along the walls of the house."⁹⁰ There were but two classes or social divisions among the Salish: the chiefs and the people. The principal duties of the chief consisted in maintaining order in the village, deciding disputes and looking after the poor and aged. His privileges lay mainly in the honor of his position.⁹¹ The first duty of the Cheyenne chief was to take care of widows and orphans; the second, to act as peacemaker.⁹² Among the Pawnees, though the chieftainship was hereditary, "authority could be gained only by acknowledged personal accomplishments." There were four chiefs of different grades, "but often some warrior who held no office, and bore no title might wield more power and influence than any of these."⁹³ The Omaha chiefs were "respected not only because of their authority, but as having been favored by the unseen powers, who had granted them help and had strengthened their ability to be steadfast in purpose during the years wherein they struggled to perform the acts required to enter the rank of chief." Like other of the Indian chiefs they had sacerdotal functions. Despotism was very rare among the Indians.⁹⁴

The Aztecs had a theocratic, monarchical system. "Of the monarch it was believed that like the modest sorcerer of a primitive tribe he could make rain or good weather, and at his coronation he had to swear to keep the sun regularly on its course, cause the clouds to pour down rain, the rivers to flow, and the grain to ripen."⁹⁵

The Guiana chief sets the days for festivals and dances, gives the commands to set food before the guests, and calls to council at need. "He never gives his orders in imperious wise, but suggests them, as it were, for the free choice of his subjects. But he is an unlimited ruler in war-time. He gets part of every hunter's and fisherman's catch." Among the Caribs only courage and bravery receive acclaim; the wilder the former and the more striking the latter, the more does the hero's name resound in the war-songs. The candidate for chief has to go through the most cruel and difficult tests of his courage, endurance, and steadfastness; for instance, after a most severe and protracted fast, he must drink a large calabash of strong capsicum mixture without making any faces about it. Then he is laid in a hammock full of big ants, wrapped up in it, and subjected for hours to the attacks of the infuriated insects; and he must not move or sigh under the torture. "If he withstood all these tests with fresh courage, he was recognized as chief with cries of joy; his will was henceforth that of the whole society."⁹⁶ Among the Shingu Indians there were in all the larger villages several chiefs, only one of whom, however, represented the community. He was a sort of house-father on a grand scale, but had to be generous in order to keep the esteem of the others. The hereditary Bororo chief commands in war and ordains the hunt in peace; but the medicine-man is really more important.⁹⁷ The Shingu chief has no special privileges. He keeps order, directs cultivation, represents his village to visitors, and settles quarrels; but he may not punish.⁹⁸

The Botocudo chief exercises little power. His office is not hereditary, and his influence does not always suffice to smooth out the quarrels of even his own community—quarrels whose occasion is mostly provided by the women. A successful champion in a dispute often becomes chief.⁹⁹ In general in Brazil, only personal characteristics raise one to be leader—bodily strength, courage, wisdom, and ambition. Among the rudest tribes the chief stands forth but slightly from the mass. "Cannibals, who scarcely speak the native language, neither know nor tolerate any conception of leadership, in their dull pride wishing only to rule themselves. They have unconsciously become subjects out of laziness, vanity, and selfishness. For it is solely the relations with the whites which the chief knows how to manage for them all, that seem to have given him the ascendancy that he maintains among his fellows. From being a trading-commissioner he has become ruler of the horde."¹⁰⁰

Even the Inca of Peru was restrained from action contrary to his tribesmen's interest and to custom; and there was alongside the tribal chief an influential spiritual chief. The two bore something the relation to each other that the Japanese Mikado and Shogun reveal; but the actual rule was fully in the secular chief's hands and the other was more and more restricted to purely priestly functions.¹⁰¹ In the central Chaco the chiefs own the hunting-grounds and the standing of each depends upon the quantity of game he controls, which brings followers to him. In Paraguay, "the power of the chief is very limited and consists only in the ordering of the internal relations of the tribe"¹⁰²—this despite the warlikeness of the tribes. Though the South American nomads of the plains are warlike, their political organization is loose. A rich chief may be able to gather followers at command, but in most cases the popular assembly is the deciding power.¹⁰³ Among the Araucanians "a chief's importance, socially and politically, depended directly on the number of male relations he could muster and on the number of unmarried daughters (basis of future alliances and riches) that he possessed."¹⁰⁴

"Until shortly before the conquest, Teneriffe was one consolidated monarchy governed by two kings—one living, one dead. The latter remained until his successor died, when his body was removed to the common resting-place of kings, or, according to one authority, was thrown into a pit." When a new ruler came to the throne—a stone covered with skins—he was presented with the royal humerus, which served as a scepter and was carefully preserved in a leather case. Some say that he received the skull of a predecessor. The oath of office ran: "I swear by the bone of him who has borne the crown, to follow his example and to seek the happiness of my subjects." The under-chiefs swore allegiance upon this bone.¹⁰⁵

A function of the chief which, although already alluded to, deserves special consideration is the regulation of industry. We have here probably the prototype of state aid to and regulation of agriculture, commerce, and other branches of industry. The chief in the Loyalty Islands fixes the time for the gathering of the harvest, and receives its first-fruits.¹⁰⁶ One South African chief fixes

the price of goats; no one dare ask more.¹⁰⁷ Amongst the Zulus the king sets the time for planting,¹⁰⁸ while in Togo no one may sow or harvest his yams and other plants without the permission of the priest.¹⁰⁹ The Somal chief is the only merchant; no subject may deal directly with strangers.¹¹⁰ Among the Hovas, the government has free disposition of all subjects, and service to the state is demanded of all. "There is no payment for services rendered to the state, which is a most significant fact, on account of the extension of governmental power, and especially because the ministers of state are the chief merchants of the country. Not the least of the useful services which the Europeans have rendered to the social and economic welfare of the Hovas consists in the introduction of the wages system."¹¹¹

Sikhim, in the Himalayas, has a sort of feudal or still more primitive government, which forces the people, other than the priests or lamas, to work for it whenever and wherever called on, without remuneration. On one occasion an uproar was made by the peasantry and serfs as a protest against a demand for forced labor, which they deemed unusually excessive and grievous.¹¹² The regular officials of a Sema village are five: the chief, the priest, the first reaper, the burier, and the divider of meat. It is the priest's business to initiate the sowing and to announce all the taboos for crops. From the point of view of religious ceremonial, he is the most important person in the village.¹¹³ In Burma the chief superintends the gathering of the crops,¹¹⁴ while in British North Borneo the chiefs decide on the farming-grounds for the year, a decision which is founded on information supposed to be vouchsafed by the birds of omen.¹¹⁵

In the Polynesian Islands commerce was carried on by or for the chiefs, which was favorable to its development because only they were capable of managing large expeditions, having both authority and knowledge. As especially good merchants are mentioned the Tongans, who carried on the trade between Fiji and Samoa.¹¹⁶ Net-making for salmon in Polynesia was an affair of state; "the salmon net is seldom possessed by any but the principal chiefs."¹¹⁷ In Tongatabu there was an important administrator "who controlled the food supply, inspecting, with the help of his deputies, all the produce of the island, giving directions as to cultivation, seeing that every man cultivated his quota, presiding over the food taboo, ordering what should and should not be eaten, and interdicting consumption of any form or forms of food of which a shortage seemed likely, not merely on account of drouth, but in consequence of lavish consumption involved in the entertainment of visitors or the holding of a great festival, or arising from war."¹¹⁸

The chief of the Sitka Indians has always the entire management of all the trade belonging to his people, and takes infinite pains to dispose of their furs advantageously. "The moment a chief has concluded a bargain he repeats the word *Coo coo* twice, with quickness, and is immediately answered by all the people in his canoe with the word *Whoah*, pronounced in a tone of exclamation, but with greater or less energy, in proportion as the bargain he had made is approved."¹¹⁹ Among the Pawnees, buffalo-hunts were tribal, and in conducting

them officers were appointed to maintain order so as to permit each family to procure its share of the game.¹²⁰ In New Mexico the chief each day announced the tasks of the different families making up the inhabitants of the pueblo.¹²¹ Among the Shingu Indians the chief superintended the planting, and saw to it that the necessary store of meal was laid up. At feasts, and when strangers came, he caused the cakes to be baked and the drink to be prepared. Among the Bororo the chief ordained the hunting-expeditions.¹²² Supervision of agriculture was detailed by the Incas to the village-director, who each night gathered the adults together and arranged for their tasks the next day.¹²³

The Arabian chief's duties were many and heavy: assistance of his own people in peril; revenge of outrages by aliens; the rendering of justice. Day and night he must be guarding the interests of his people, and in particular must make the rounds of the encampment at night. He must not be overbearing but hospitable and kind.¹²⁴

Homer¹²⁵ is very clear upon the advantages of concentration of power and responsibility: "Not good is the rule of many; let *one* be ruler, *one* be king, to whom the son of Kronos has given it." The Homeric king was preëminently a war-chief; and the possession of physical and mental power was indispensable. He must secure victory without and peace and discipline within. He was the preserver of the *themistes*, or mores, "the guardian of those social customs and guarantees which the experience of preceding generations had evolved as rules of proper living. . . . In war and peace the king was the guardian of the social bond and order. Also from the patriarchal organization of the family he took over into the state the function of head-sacrificer. . . . The position was one of power and also of duties and responsibilities; besides the care of the people and their interests, he supervised public works, entertained publicly, and, if he was a good king, took a fatherly interest in his subjects. The position was, of course, one of great honour and emolument, and to be king was great fortune; 'speedily one's house grows rich and himself more highly honoured.' . . . The value of the king to the people was the value of strength and discipline in times of violence."¹²⁶

In ancient Greece, as in old Germany, there were gentes with patriarchal "kings" over them—many of them in one district. If confederated for war or otherwise a chosen leader was set over them all. This was rational and expedient, not natural and necessary according to the blood-tradition. Odysseus was such a leader of gentes in Ithaca, and there was an intrigue to succeed him by marrying his supposed widow. On the larger scale Agamemnon was the chosen chief of the confederated kinglets warring on Troy.¹²⁷ But in considering the Homeric king at this time we are already advancing beyond the subject of mere tribal chieftainship.

\$156. Succession and Distinction.

WHILE generally in Australia patriarchal dignity alone is recognized, there are hereditary chiefs to be found.¹ "There is an impression among the aborigines that the second son of a chief is generally superior to his elder brother;

and, if proved to be so in fight, the latter gives up his claim as a matter of custom, and the tribe accepts the conqueror as its head."² In the New Hebrides and elsewhere in Melanesia, "there are no men distinguished by higher or sacred blood, none who have an official and political position which they inherit and transmit to their posterity"; but in some "Polynesian speaking communities, there are hereditary chiefs, who as children can succeed their fathers, and who alone possess the power of the *tapu*."³ In one region of New Guinea, "in the succession to chieftainship, an uncle acts for the child chief, though obliged to give all orders in his name."⁴ The Fiji institution of "Vasu" seems to have arisen "out of the natural reverence with which the subjects regarded the king's sister's son when he visited his uncle." Vasu [nephews] get gifts wherever they go; they bring them back and share them with the king, so that "the Vasu-right becomes an instrument in the king's hand for ruthlessly plundering the land."⁵ In this case, with relationship reckoned in the female line, the nephew is heir-apparent and is endowed with the fetish-quality. In San Cristoval, Solomons, descent is usually reckoned from the mother, but in the clan of the chiefs descent may be reckoned either from father or mother. All men of this clan are called by a term meaning literally "great man," while all men of other clans are "people of no importance."⁶ In southern Melanesia the person who succeeds is not the son but the sister's son.⁷

Among the Zulus, "the oldest son of the chief wife is the presumptive heir to the throne; if she has left no male issue the next brother of the dead chief, from the same ruling house, or the male issue of his chief wife succeed. Only in case there are no heirs at all from the original great house does the succession go over to the smaller houses."⁸ In Mashonaland the status-wife, whose son is to succeed to the exclusion of all other wives' children, is designated by special insignia which she transfers to the child when it is born.⁹ Among the Ovambo the succession goes to the son, or if there is none, to the daughter of the first wife.¹⁰ The king of Uganda, who is an absolute monarch, is chosen from the princes by the prime minister and chief guardian of the princes; he must be of the blood royal. The royal family traces its pedigree through the maternal clan, but the nation through the paternal.¹¹

When a king in Uganda dies, the three greatest dignitaries choose his successor from amongst his children, or if they cannot agree, they fight. A boy is always chosen, and his mother is regent, together with the three dignitaries, during his education. The king's brothers are imprisoned during his minority and at its end all but two or three of them are burned. The ones left continue the line.¹² The reigning sovereign of the Bahima, before death, announces who is to succeed him, but, should the chiefs have any special reason for disregarding the late king's wishes, another person is elected from among the princes. "The chief reason for setting aside the former king's selection is, dissolute life or evil temper; the choice of a successor is decided by his qualifications, and not by his seniority; when the chiefs differ about the selection, each party places its candidate at the head of a force, a battle ensues, and the war continues until one or other of the claimants is killed, when the conqueror takes

the throne."¹³ On the death of the Kavirondo chief his power descends upon the eldest son of his first wife, even though his second or third wife may have borne him a son before the son by the first wife was born.¹⁴ Among some East African tribes chieftainship is hereditary to children; failing them, to brothers; among other tribes, the nephew of the chief succeeds; if none, the chief's sister succeeds.¹⁵ In West Africa, the successor is appointed from among the king's sons. The eldest son is considered the next heir, but state-officers have the power of rejecting him and selecting one of the other children. There are here cases where succession is traced through females, "the heirs to the throne being the king's brothers in order of seniority, or failing these, a sister's son."¹⁶ A king's son expects to succeed, but there is no invariable rule; he may not take the position by force. "He must be chosen; but the choice is limited to the members of one family, in which it is hereditary."¹⁷

"Despite the enormous distance from Guinea to the Great Lakes of the Upper Nile, the political system is identical, and it is about the same as that of all the countries between"—namely, small, despotic, hereditary monarchies.¹⁸ The chieftainship of the Teda is hereditary, but not to the son. It goes to the oldest surviving member of the family.¹⁹ In one African case, the chief's eldest son, his first wife, and the principal personages must commit suicide on his elevation. This custom "prevents the consequences, often very baneful, of an hereditary monarchy. . . . The king is always elected and his son can never succeed him."²⁰ The Ainu show no traces of allegiance to a single ruler; each village has its own hereditary chief.²¹

In a number of the Polynesian groups the title passed automatically from a father to his eldest child, whether the child was a boy or a girl. This no doubt means that the succession went to the first-born by the chief's official wife, and not to the first child of any of his wives. In some places the first-born was regarded as especially sacred. In Samoa the rule of primogeniture was not strictly followed, though the authority and title always remained in the same family. The qualifications for succession were: personal characteristics, presence of a claim through descent or adoption, nomination through the testator's will or by the family, and public recognition. There were three families on Bowditch Island from which the king was selected, and they always chose an aged man, holding that a young man was a bad ruler and that mature age was essential to the office. On Easter Island it was the custom for the king, as soon as his eldest son married, to abdicate in the latter's favor, and become an ordinary individual, and as a consequence of this practice they often prevented the royal children from marrying before they had reached an advanced age.²²

Among the Tsimshian "when a chief dies, the chieftaincy devolves upon his younger brother, then upon his eldest nephew, and, if there is none, upon his niece. The chief's four counselors become the counselors of his successor. When a woman becomes a chief's successor, she also takes his name."²³ The office of head-man or tribal chief among the Salish bands was theoretically elective but practically hereditary. "It was this hereditary character of the chieftaincy

which gave rise to that threefold social division of chiefs, nobles, and base folk, which prevailed among the lower Salish tribes."²⁴ Among the American Indians generally, the chieftainship was usually hereditary in certain families of the community, although in some communities any person by virtue of the acquisition of wealth could proclaim himself a chief. Descent of blood, property, and official titles were generally traced through the mother.²⁵ Morgan²⁶ has explained the rules of succession especially among the eastern tribes: "When the Indian system of consanguinity is considered, it will be found that all the male members of a gens were either brothers to each other, own or collateral, uncles or nephews, own or collateral, or collateral grandfathers and grandsons. This will explain the succession of the office of sachem which passed from brother to brother, or from uncle to nephew, and very rarely from grandfather to grandson. The choice, which was by free suffrage of both males and females of adult age, usually fell upon a brother of the deceased sachem or upon one of the sons of a sister; an own brother, or the son of an own sister being most likely to be preferred. As between several brothers, own and collateral, on the one hand, and the sons of several sisters, own and collateral, on the other, there was no priority of right, for the reason that all the male members of the gens were equally eligible. To make a choice between them was the function of the elective principle."

Where ancient kings tried to consolidate their power by attaching able men to the throne, they still had to take account of the kinship bond by creating relationships and by adoption. To adopt even an adult, the breast was offered. So deeply does the kin-idea cut.²⁷ In Persia the project of making a noble king was given up, for "although the hero is favored by fortune and has an enlightened spirit, still the choice must fall upon a man of royal blood, who is in possession of memory of the past. With the army it is as with a ship, and the throne of the king is wind and sail for it. Every prince without consciousness of his position is unworthy of the chair of power; we must have a king whose star is victorious, upon whom the grace of God rests, and whose words radiate wisdom."²⁸ In Arabia the only accord in choosing a khalif was found in the case of an insignificant man. The six captains of Omar were to choose a khalif without delay. Their choice fell upon the eighty-year-old Othman, a feeble character, but of the Prophet's tribe and family. The khalifate passed speedily into an absolute, hereditary monarchy.²⁹ In a later day "Hungary appears, according to the strength of the parties, as an hereditary or an elective state; but the electors held, with a single exception, to the house of Arpad.³⁰ The old kin-criterion died a difficult death.

The custom of "tanistry," a system "under which the grown men of the tribe elect their own chief, generally choosing a successor before the ruling chief dies, and almost invariably electing his brother or nearest mature male relative," was preserved for a time in Europe because of the example of the Ottoman sultanate. In that office brother succeeded brother and all traces of election by the people, if it ever existed, were lost. "As followed by the Turks, the system of course excludes females, but it would probably have excluded them at all times, as its main object is to secure a military leader in the maturity

of life." In the house-community, an institution of South Slavonia and neighboring regions, the most important member is the house-chief. He is elected by the collective brotherhood, who choose "a member of the family connected with the common ancestor through descents of primogeniture. Its inclination would be to choose the eldest son of the last chief, but its veneration for age, and its sense of the value of experience as a means of success in the struggle for existence, lead it constantly to elect the next brother of the last administrator."³¹

Distinction. The lower class of the people in some of the South Sea Islands is under complete subjection to the different chiefs, particularly to the king. "If one of them should chance to meet him, he passes him in a bending posture, at the same time repeating a few words, which manifest his obedience"; he nevertheless would go half a mile out of the way to avoid the encounter. The king's wife has respect shown to her by other women.³² This deference to the ruler may be attributed in part to the belief that he is divine or that he is closely related to the gods. The sacred king in Fiji, for instance, seems to have been connected by office with the gods. "He was bound to uphold religion, and to maintain the custom of cannibalism. His person was peculiarly sacred. He never personally engaged in war. He alone could wear a turban during the drinking of kava. It was taboo to strangle his widow, though some of the widows of other men were always thus destroyed. It was taboo to cry or make lamentation on the occasion of his death. At his death alone was the conch-shell blown, this being a repetition of the ceremony annually practised on the supposed departure from earth of the Fijian Ceres."³³ In the Western Solomons the word which means chief in some places, in others means god. "A ceremony which in Rotuma was celebrated at the tombs of deceased sacred chiefs was in Eddystone of the Solomons performed at the shrines of the gods. The inference is that the Eddystone gods are chiefs and that the institution of divine kingship did once exist in those parts."³⁴ The etiquette to be observed when encountering the ruler is very strict. In one section, when the great chief comes from his house "no one dare walk about the village in an upright position. Everyone either walks in an abject, stooping position, or in some cases actually crawls on hands and knees, and no one speaks above a whisper when he is talking."³⁵ If the chief on another one of the islands is in his house, "a visitor who enters will kneel at the door and will move towards his superior on his hands and knees till he reaches him, when the pair touch noses in the customary manner. He then withdraws a pace or two and sits down cross-legged, no other position being allowed in the presence of a chief. The chief would then call out to his wife for food and the pair would talk while eating. When the talk is finished the visitor will ask permission to go and will leave on his hands and knees as he came without turning his back to his superior. If the chief is out of doors when he is visited the man who approaches him will kneel down at a few paces' distance and move towards him on hands and knees to salute him. . . . The sanctity of a chief seems too to be shown by the fact that no woman may go in his canoe which is known as a *tapu* canoe."³⁶

Grant³⁷ was once talking to a Mavenda chief in South Africa when the latter

had a severe cold; "his breathing was far from easy, and at short intervals he coughed and expectorated freely. Among the Zulu such discharge is invariably removed with a small broom made of grass, but on this occasion the hand of an attendant did duty for the broom, and two *incekus* (attendants) appeared to vie with each other as to who should first render the willing service of rubbing into the ground. During the act of coughing, every man present reverently bowed his head, noiselessly clapped his hands, and in a low tone of voice repeatedly uttered the expression, *Entowoo tobela*, meaning the *lion has done it.*" In court the king of Uganda sits in state upon a stool placed on a leopard-skin over which is spread a lion-skin; no one may step on the royal mat on pain of death. The second officer in the country is the keeper of the royal placenta; each new moon, in the evening, he has to carry this in state, wrapped in bark cloths, to the king. "On the birth of a prince the placenta is dried and preserved, placed in a pot which is made for its reception and sealed up." When a king dies the prime minister becomes the bearer of the jaw-bone which is called the "king" and which is placed with the placenta in the tomb. Directly the new king is elected he is placed upon a large stone on a high hill amid general rejoicing and feasting and is said to have "eaten Buganda." The king never walks anywhere outside his enclosure; he is carried on the shoulders of strong men who go at a quick trot with him.³⁸ The Ba-Yaka are ruled by one great chief who considers them all his slaves; on entering his presence all prostrate themselves and beat their breasts.³⁹ The insignia of office of the Wawanga chief of East Africa are the sacred spears, the leopard-skin cloak, and the copper bracelet. "Great importance is attached to this copper bracelet; by virtue of its possession alone does the king hold office." All sorts of superstitions have been woven round the king's copper bracelet by the common people, who regard it with the very greatest awe and reverence. One of these is to the effect that if the king wishes to cause the death of anyone, he can do so by striking together, at dead of night, this bracelet with another one he wears on the other wrist, pronouncing at the same time the person's name. The sacred spears are of a very great age, and several of them are of peculiar pattern and workmanship. The king has a prerogative to the tusks and tails of dead elephants, to all skins of leopards and lions, to the monopoly of sleeping on a lion-skin or wearing a leopard-skin cloak and of wearing certain stones and beads, to the skin and certain meat of the hippopotamus, and to all buffalo-skins, which last he gives to warriors to make shields. No one may sit on a stool or chair in his presence.⁴⁰

The cruelty of despots always seems to engender politeness. The freest nations are generally the rudest in manners. An Indian official once remarked to Sir Harry Johnston that the excessive, deep-seated, elaborate politeness of the natives of India was due to the two thousand years' "whacking" they had received from dynasty after dynasty of cruel despots. "So it has been in Uganda. The chiefs and people became fastidiously prudish on the subject of clothing, and regarded a nude man as an object of horror. They preferred in their language not to call a spade a spade, but to substitute for any plain noun dealing with sex or sexual intercourse the politest and vaguest of paraphrases. Yet the nation was profoundly immoral, and the dances in vogue even at the present day can be exceedingly indecent. But the race became, and remains, the politest

in Africa."⁴¹ In the Central African Lake region the mode of salutation is most elaborate. "An inferior in saluting a superior takes a piece of dried mud in his right hand; he first rubs his left arm above the elbow and his left side; then throwing the mud into his left hand, he in like manner rubs the right arm and side, all the time muttering away inquiries about their health. In making speeches the speaker always commences with the same salutation, and each time the chief's name is mentioned every one begins rubbing his breast with mud."⁴²

On the Congo, shooting-stars and comets are supposed to signify the death of a great chief.⁴³ A chief in the Niger Protectorate never allows a native below him in rank to have an umbrella open before him, so an inferior closes his umbrella on approaching a chief, while the chief keeps his umbrella open.⁴⁴ On the Loango Coast the king has six titles connecting him with six divisions of sacred symbols; and an iron bell is the emblem of royal dignity.⁴⁵ In northeast Africa the symbol of power consists of several rods overlaid with metal-work, which the sultan sends by his soldiers to those places where he intends to extend his dominion.⁴⁶ The chiefs of the Dinka and the kings of the Shilluk are regarded as beings almost divine, upon whose correct conduct the preservation, or at least the welfare, of their people depends. "In fact, they belong to that class of ruler to whom Professor Frazer applies the name Divine Kings, believed to incarnate the divine spirit, and who were periodically killed lest that spirit should suffer from its retention in an ageing body. Every Dinka high chief is killed in his old age, this being done at his own request with all ceremony and reverence. The Shilluk king was also slain by his subjects, nor was his death postponed until, in his old age, he felt that he had done all that he could for his people, but he was killed while still in vigorous middle age directly his wives complained that his generative faculties were weakening."⁴⁷

It is said that when a Genoese merchant in Tamerlane's camp declared that an act of Tamerlane was cruel, the latter was very angry, and asserted that he was not a man as other men, but sent by God for the destruction of the world.⁴⁸ The onerous life of semi-divine kings described by Frazer is led by several chiefs of northeast India.⁴⁹ In ancient India "every king is regarded as little short of a present god. In Manu's law-book a king is said to be created by drawing eternal particles from the essence of the eight guardian deities. . . . Again, he says, 'A king, even though a mere child, must not be treated with contempt, as if he were a mortal; he is a great divinity in human shape.'⁵⁰ In general, we are confining our examples to primitive peoples, but we may bring them into relief by citing cases like the above and also the Chinese and Japanese theories. "In China the emperor is the second being of the whole universe; nobody is above him but the God of Heaven, the highest deity of the Pantheon, of whom he is the only son and vice-regent on earth. As over all human beings, he also bears sway over all divinities; and even these stand in rank and position below a mandarin in his quality of imperial proxy."⁵¹ In Japan, "implicit obedience to the Mikado is required. It is admitted that he

may not always be good, but as his real character is that of a god, his authority is never to be disputed. It is a remarkable fact that never during the history of Japan have the people knowingly rebelled against or opposed the will of the Mikado. They have been misled at times by designing leaders, but in intent they have ever been faithful. The possession of the Mikado's person has always been a source of strength to either of the contending forces."⁵²

In Sumatra the orders of the sultan of Atjeh are first communicated to a woman who stays at his feet. She tells them to a eunuch, who transmits them to an officer, who, finally, proclaims them before the assembly.⁵³ In Celebes the sign of respect for rank is to take a garment from the shoulders and wind it loosely around the hips.⁵⁴ In Java "it is respectful to cover the head, instead of uncover it; to sit instead of stand. It is the very highest degree of respect to turn one's back upon a superior, and often presumption to confront him. It is the custom to sit cross-legged and on the ground. When an inferior addresses a superior, his obeisance consists in raising his hands, with the palms joined before his face, until the thumbs touch the nose. This he repeats at the end of every sentence, and if very courtly, at the conclusion of each clause. When equals meet, their salutation is cold and distant, but in the ordinary intercourse of life, a relative superiority or inferiority of condition is usually confessed, and a demonstration of it constantly takes place. If a son has been long absent from his father, he throws himself at his feet and kisses them. A demonstration of affection, less profound, would extend the embrace only to the knee, but a very obsequious courtier will sometimes take his monarch's foot and place it on his head. . . . An inferior never stands upright before a superior. If he stands at all, the body is always bent; if he sit, it is the same thing, and his eyes are fixed to the ground. When he advances and retires, he moves as if on all-fours, and crawls or creeps rather than walks. There is one mode of demonstrating affection and respect, particularly nauseous and indelicate. It consists in the superior's offering to the inferior the chewed refuse of the betel and areca preparation as a mark of great affection, which the latter swallows with much satisfaction."⁵⁵ When the Rajah of Lombok, Malay Archipelago, appears, all the people squat down upon the ground in respect, and every man riding gets down off his horse and squats. The highest seat is literally the place of honor and the sign of rank. "So unbending are the rules in this respect, that when an English carriage which the Rajah of Lombok had sent for arrived, it was found impossible to use it because the driver's seat was the highest, and it had to be kept as a show in its coach-house."⁵⁶

In Polynesia and Micronesia the presence of princes on earth is taken to be only an episode in the heavenly existence of god-born beings. A fate holds them here and they return only as souls. In Hawaii there was a peculiar court language, unknown to the people—or if it became known, the chiefs altered it. In Tahiti words which were holy, because they entered into the names of chiefs, must be replaced by others. There was no crime for the blood-royal. Flattery overpowered the infantile minds of the chiefs so that they came to believe all that was said of them.⁵⁷ The Samoans had two entrances to the spirit-world,

one for chiefs and the other for common people. The dignity of chiefs was here too recognized by a court language, and their rank was distinguished by special words regarding their presence and speech. The people either squatted or stooped in the presence of chiefs.⁵⁸ The practice of killing the king once prevailed in Niue, and there resulted an unwillingness to take office. Turner⁵⁹ thinks the usage was due to the belief that the kings caused the fruit to grow; in times of scarcity the angry people killed them. On another island, the king was charged with the special duty of uttering prayers so as to keep away the evil spirits that might injure the land.⁶⁰ The Maori chief was looked upon as the counterpart of the gods. "He was the representative, the resting place, of the gods in this world. Also, he was extremely *tapu*, so much so that he could not keep himself clean. His head could not be washed, or his hair dressed, because of this intense state of *tapu*. Hence his hair became matted and dirt-laden."⁶¹ The chief in Kushai, in the Caroline Islands, seemed to be an absolute ruler "and was treated by the people with a degree of subjection that I met nowhere else. In the presence of the exalted pair speech must be only low; the people approached with humble demeanor and crawled almost on their knees up the steps of the veranda where they set down baskets of food and other tribute. With exception of the chiefs and their kinsmen everybody must work for the ruler, who gives land only as a loan for which return in kind is given."⁶² The chiefs let their beards grow for the sake of respect; their subjects heard their orders with lowered eyes and obeyed blindly.⁶³

In Ponapé "so great respect is accorded the king that no one goes to his house except the two or three principal chiefs, and they sit down inside the house, but near the door and on the ground; the rest of the tribe come no nearer than its threshold, remaining outside. The women, when they pass before the king's house, do so bending over and if they are in the field when he goes by, they squat on one side or the other of the path he follows." At the great annual festivals the wives of the chiefs are not allowed to be present because it was forbidden the lower classes, under penalty of death, to see them.⁶⁴ The first chief of Nukuoro was raised to be a god and his soul is honored in the form of a stone on the public square.⁶⁵ The ruler of Tonga is a priest-king. He must marry the daughter of his brother, who is civil governor. When she has had one or two children she is taken away from him. Her son becomes the next chief and her daughter's dignity is very great. "Her rank is too high for her to marry any mortal, but she may have a family, and in case of the birth of a daughter, this child becomes the *Tomaha*, who rises higher than her mother in rank and is nearer the gods. Everyone approaches her with gifts and homage. Her grandfather will bring his offerings and sit down before her. Sick people come to her for cure."⁶⁶

The omission of the American Indians, with the exception of the advanced groups of Maya, Aztecs, and Incas, from this account of subservience to the chief and belief in the divinity of kings, is noteworthy. In Homer the divine right of kings is recognized at times. The king not only is leader in war and the first in the council, but also represents his people before the gods. At the

feast of the Achæan council before setting out for the first battle of the Iliad, Agamemnon offers the prayer for the sacrifice, as the head of the public family, and at the making of the truce for a single combat, he prays to the gods and cuts the throats of the lambs.⁶⁷ Among the ancient Hebrews the difference between judge and king was that between an elected official and a ruler appointed by God. While the right of the latter was divine, he felt himself to be the son of God, appointed to be first among men, and ruled under the divinity whose interpreter was the priest. The king united in himself the highest priestly dignity, while the judge had only two royal functions: that of chief officer in times of peace, and in war that of commander-in-chief. As the kingship became weaker, the influence of the priests on legislation and the administration of justice became greater until both were completely in their hands.⁶⁸ In ancient Sweden the King at Upsala is called by the bards "the keeper of the holy altar"; in fact, the sacrifices at Upsala were the foundation of the claim of that district to give a king to all Sweden.⁶⁹ With a genuine civilization equal in degree to that of their kindred in Britain and Scandinavia, the Germans of continental Europe found themselves called upon to live up to the elaborate civilization of the Roman Empire. They broke down under the strain. "Just as a party of savages will disport themselves in the garments of a shipwrecked crew, so the Merovingian and Karolingian kings and officials decked themselves with the titles, prerogatives, and documents of the Imperial State. No doubt the wisest of them, such as Charles the Great, had a deliberate policy in so doing. But the majority seem to have been swayed simply by vanity, or ambition, or admiration."⁷⁰

Revenue. Taxation among the Bawenda of South Africa does not mean a contribution towards the good government of the country for the benefit of the people. It is rather a contribution toward the maintenance of the chief's household and position, either by way of a bribe or a fine, as the case may be. "The Mowenda dare not eat and he dare not drink unless he has first given his share to the chief. . . . The chief's subjects have to assist in building and repairing his houses, they have to work his gardens and to assist in harvesting. He receives part of the value recovered by one party from the other, and all the fines paid. The chief takes the greatest share of all confiscated property. . . . Any case laid before the chief has to be accompanied with a present, in order to find a hearing. This present is given *o woula khoro* (to open the gate). When the matter has been settled, the one who wins the case has to thank the chief again with a present, *o walela khoro* (to shut the gate)."⁷¹ In South Africa, as elsewhere,⁷² the chief owns the land and exacts tribute for its use. In many places he can demand work from his subjects.⁷³ The Marutse chief sends his men into the woods to seek honey; all belongs to him and death is the penalty for diverting any.⁷⁴ The taxes due to the supreme chief among the Ba-Yaka are collected by the great man in person, who goes the round of the villages.⁷⁵ The Baganda king, on the other hand, has tax-collectors whom he sends out into all parts of the country to gather in the annual revenues; "the office of collector

is highly prized, being a most lucrative one owing to the bribes the man receives; the king's favourites usually secure them." Another prerogative of this king is to get a percentage of the children born to the women he gives in marriage to his retainers. "A mother who does not wish her girl to be taken into the royal harem, makes a scar on her forehead or face, by burning her to disqualify her; because no woman with a scar can become the wife of a king."⁷⁶

The right of a Polynesian chief or other head of a group to tribute in kind or first-fruits was generally enforced, even by raiding the subjects if necessary. In some instances there is evidence that what he receives is, in theory at least, an offering to the gods, handed to him as high priest. On the other hand, there is evidence of a widespread practice whereby chiefs are supplied in a more or less irregular and unsystematic way with food, and in some cases with other goods also. In the Marquesas the kings of districts had the right, in a fruitful season, to one-fourth of the produce of the lands of their subjects, and in other seasons a portion according to circumstances. In the island of Niue there were no taxes beyond the obligation to provide feasts for the councils and occasionally to carry food to the king or to the chiefs of villages. The subjects of a Society Island chief had to supply him with food and other things, while he had the power of confiscation over them. Pritchard says it was a maxim among the Samoans that a chief could not steal; he was merely regarded as taking anything he wanted from his people, and his own immediate followers would be rather flattered than otherwise to think that anything they possessed was coveted by him.⁷⁷

Taxes in the modern sense were unknown to the Homeric Greeks. Though the king received gifts as tribute from his subjects, these gifts were not fixed and definite. Money payments could not be expected at a time when trade was barter; and no fixed ratio, as a tenth of the produce of flocks or fields, was determined for tribute; more than occasional presents, however, are implied in the words of Agamemnon, who offers to Achilles, if he will return to the work of battle, seven well-built cities in which dwell men who "will honor him as a god with gifts, and under his sceptre will pay delightful dues." The king could call upon his subjects for service in war; for the expedition against Troy each household was expected to furnish at least one warrior. If the king went on the foray in person he had a right to his ordinary share of the booty, as well as to his special gift of honor, which was set aside before the general division of the spoil. He had also an apparent right to an invitation to all feasts made by his subjects.⁷⁸ Herodotus⁷⁹ says that down to the time of Darius, the Persians paid no regular taxes, but brought gifts to the king; while we read that the children of Belial brought to Saul "no presents," that is, they did not recognize his authority.⁸⁰

§157. Women as Rulers.

THE king of Uganda had a co-regent in his sister, and his mother was royal in a secondary degree. A female ruler south of Lake Albert, who had lost control of her chiefs and had very little authority, passed for a witch and might not

be seen, but received sitting behind a bark curtain. Her chief minister was an ugly old woman. Stuhlmann,¹ who reports these cases, doubts whether she exists and thinks a ventriloquist impersonates her. He tells also how the wife of a Latuka chief succeeds him if he dies childless. If she marries again, her second husband has no share in power nor do her children by him; the heir is her first husband's brother. In one of these equatorial states a unique dignitary is an unmarried woman who decides the selection of the new chief and has her own court and tributary territories. There are two states and two forms of government woven together. She has her man on whom she hangs all the decorations, and this "husband" is designated as a woman. Other tribes have the same tradition as these peoples, about how the kingdom was founded by a hunter who came from abroad and won the love of the ruling queen.² Nachtigal³ found a female ruler in the Sudan. In Madagascar the Hova queen's husband is her prime minister. Three queens succeeded each other with only a short reign of one man between.⁴ In the Maldive Islands a queen once ruled in place of her brother who had been deposed for misconduct. Her husband really governed, but entirely in her name.⁵

In one district of Borneo the most influential persons were two old women who had long had the power in their hands; they dressed in men's clothes, took sword and spear in hand, commanding the people in time of war, and working as hard as any of them. A female rajah occasionally appears in the Archipelago; in one case a "colossal woman" whose husband was relegated to insignificance.⁶ There were four successive queens in the seventeenth century, in Atjeh, one of the most turbulent states in the Archipelago. "The spirit and the prudence of most of these queens, the policy with which they knew how to hold in equilibrium the parties of jealous and envious nobles, together with the influence of several powerful ministers, seem above all to have rendered that epoch of about sixty years the most peaceful in the annals of Atjeh." The Dutch found a similarly well-governed realm in the hands of a queen, on the east coast of the Malay Peninsula.⁷ Celebes is "not the only country of the Archipelago in which women are raised to sovereign authority. There is hardly a country of it in which women have not at one period or another of their history sat on the throne; and it may be said that the practice is most frequent where the government is most turbulent."⁸

In Samoa "every larger community and every political unit possesses a 'taupou,' a maid, as representative, with special rights and duties. She always belongs to the highest family-group of the district or community and remains under strict oversight; her reputation is blameless and must be so so long as she remains in 'office and dignity,' . . . Almost more than in the male representatives of noble families there is incorporated in the taupons the dignity of position, of pride in ancestry with female descent. . . . In general the taupou represents a noble kin-group; she may therefore be ruler over a whole district. Under her then are many others of her kind, of less noble blood." In almost every village there rules a village maid, carefully supervised by older dames. The taupou "along with the first chiefs passes upon public affairs, and above

¹ *Mit Emin*, 189, 252, 789; in *Globus*, LXXXVIII, 337, is an account of a visit to this person, who had become the tool of the stronger party in the state.

all upon the female members of her district of authority."⁹ In Micronesia there is a social division of the women parallel to that of the men, so that the women form a special state. In the Pelew group they have a queen of their own, with female chiefs about her. These maintain order among the women and judge them without interference from the men. The system seems to have arisen because the men were so strictly organized by themselves. The women have the right to claim particular taxes with which to celebrate feasts. The title of chief descends from one sister to the next younger. The wife of the king is therefore never the queen of the women, since marriages in the same family are forbidden. In order that the male and female rulers may never be combined or interfere in their spheres, the chief may not marry the daughter of a chief.¹⁰

"Women in the position of chief were not so rare, among the Indians, as has been thought. The first Spaniards on Haiti found such a phenomenon there, de Soto in Georgia, the Pilgrim fathers in New England, the French among the Natchez, and Juan Rodríguez among the Californians in the Monterey region. Later no more was heard of such female chiefs so that it seems almost as if in this matter too a change had come about after the entrance of the Europeans, as indeed in so many other customs, usages, and conceptions of the New World natives."¹¹ Newport¹² met a "queen" in Virginia with "rather more majesty" than Powhatan, to whom she was subordinate; she is presented as in full authority over her people. Drake¹³ describes two squaw sachems, but without any explanations. One of the tribes of the Carolinas is said to have been ruled by two female chiefs, who held dignified court, with a retinue of young men and women.¹⁴ Much has been made of the political influence of the Iroquois women, but they very seldom became actual chiefs. "Among Iroquois tribes the titles to the chiefships belonged to the women of certain clans in the tribe and not to the men, although men were chosen by the women to exercise the rights and privileges and to perform the duties pertaining to these chiefships." A number of women have filled federal chieftainships, and "these women chieftains have approximately the same rights, privileges, and immunities as the men chiefs, but exercise them fully only in emergencies; they, too, maintain the institutions of society and government among the women." In common with the other tribes of the Iroquoian linguistic stock, the Tuscarora traced the descent of blood through the line of the mother, and made the civil and official military chieftainships hereditary in certain clans over which the woman chiefs and the elder women presided.¹⁵ In the early days of the Massachusetts colonies the widow of a certain Nipmuc chief assumed the chieftaincy and was known as the squaw-sachem of the Nipmuc.¹⁶ Among the Siouans, "women are never acknowledged as chiefs, nor have they anything to say in the council."¹⁷ Among the Haida, "one old dame, who could in appearance and ugliness have shamed Macbeth's witches, was greatly venerated . . . and was importuned at all times to enter their houses and make herself at home. When she condescended to enter their houses there was a special assembly. The children were quieted, and all was dignified. This woman had more authority than any chief. She was a chieftainess, and was descended

from a long line of kings of the ages long gone past. She and her husband formerly ruled Queen Charlotte Islands."¹⁸

A case is mentioned of an old Makusi widow who ruled over an entire settlement, and another case, also in Guiana, where the chief's sister acted for him during his absence.¹⁹ Among the Carib tribes the position of chief is open to women;²⁰ a female chief has been found in Brazil;²¹ and a case where the chief judges the men and his wife the women.²² In Peru, before the Incas, women held the chieftainship to the exclusion of men.²³ The inhabitants of Grand Canary were for a long time divided into ten tribes, but during the fourteenth century these were united under the control of one woman.²⁴

§159. Checks on Monarchy.

AMONG the Bawenda of South Africa the power of the chief is limited by the unwritten law of old customs, and by the council and the witch-doctors. "No law can be made by the chief unless it has been sanctioned by the councillors above mentioned. However, all the honour of ruling is left strictly to the chief, even although the order or decision given may be altogether against his will."¹ A definite aristocratic class is not uncommon among African tribes. "In Upare the village headmen and the chiefs are always of this class. The position and powers of the chief are rather just what he can make them. . . . The real power of the land lies with the elders, who are consulted in all matters. His judicial power the chief shares with the elders and other men distinguished by their intelligence and eloquence. But the council thus formed is little respected by the more powerful individuals, and it is said that in former times it was frequently overawed by the number of armed followers brought by each party, and the proceedings often ended with a free fight in which the chief himself might not be spared."² The council of elders was more in the nature of a court of arbitration than of decision. The despotism of the king of Uganda is restricted by the right of asylum to the sacred hills, of which each district has one or more. "Earls and chiefs are frequently deposed or plundered by the king for petty offences, or for becoming too rich, or for making too great a display of wealth; if a chief gets any warning or an idea that he is going to be plundered he removes his cattle and property to one of the sacred hills in the district where they are safe even against the raids of the king; . . . if the person succeeds in reaching the place with his property before the party sent to loot arrives, his goods are secure; after a few days' residence on the hill, when the king's wrath has abated, he is able to return home. Sometimes people are seized by the king and put to death, the property confiscated, and all the family enslaved; if the latter are able to escape to one of the hills they are safe, and members of the clan then see to their future welfare."³ The Kabyle village assembly attends to all that concerns the general interests of the community, even the most intimate matters of private life. Its often passionate action is counterpoised by its respect for usages consecrated by time. Age,

position, birth, and personal valor are qualities fitting one to conduct public affairs.⁴

No people in the world are said to be so apathetic as those of Central Asia in the face of any fate whatever which befalls them. They have been trained to this by long submission to despotism and arbitrary abuse. This is why Russian rule was popular; it guaranteed them against any other tyranny.⁵ Although the Kuki-Lushai clans are really democratic, they have in them the germs of a monarchical system; "a Lushai chief before our occupation was an autocrat, from whose orders there was no appeal, but if he exceeded the limits set by custom, or was uniformly cruel and unjust, his followers soon deserted him for more tactful rulers."⁶ In Bengal the "long-houses have each its chief, but with a council of notables. All is discussed there and the decisions proclaimed outside by young men exactly as with the Redskins.⁷ The East Indian chiefs do not stand alone. "Beside them there are always the elders of the families and with them the whole people whom the chiefs must consult in important cases. No arrangement may be made without the agreement of the elders and the consent of the whole people. In the essence of the matter the government is thus not of one head but of many; it is not monarchical but democratic. The chief, the *rajah*, is in the popular assembly only *primus inter pares*. . . . Every male inhabitant who is head of a kingroup has the right to speak and vote." Oratory is highly esteemed.⁸

Nowhere in Polynesia and Micronesia, however ferocious the despotism, is an intermediary between prince and people wanting; but the relation between ruler and intermediary often amounts to a secret union. In Polynesia the prince is the lord and priest of his people, but not always their military leader. Hence the government is not always simple, and we find a military leader with a nominal king behind him, as in Japan. The nobility also limit the king, while the greatest limitation comes from the council-meeting, in many parts called *fono*. There were several types of councils or assemblies, including a village, a district, or even a whole island. A village *fono* was composed of the chief, the orators, and the heads of families; all affairs of the village came before this body, and from its decision there was no appeal. Nothing was too great or too small for its attention, which would even be given to such matters as an alleged encroachment by a man on a widow's yam-patch or rudeness to a visitor. A great *fono*, that is the council meeting of a district or division or of the whole island, was a more ceremonious affair: it was held for the discussion of weighty matters affecting the whole area which it represented, dealing, among other things, with the appointment and installation of chiefs, and the declaring of war and making of peace. Either the *fono* or a council meeting of some sort was very common in Polynesia, and besides this great check on the powers of the chiefs and kings there was always the restraining influence of custom, while the personal character of the executive was also a factor to be considered. He would be a very bold chief who dared to act in direct opposition to the advice of the heads of families and other influential people.⁹ In Micronesia the chief is half a despotic ruler and half president of an oligarchic republic,

9 Williamson, *Cent. Polyn.*, I, 438; II, 441-482, 483-485, 489, 490, 492, 493, 494, 495-496; III, 100-101, 111-112, 114-115, 117, 119, 120, 121-122, 124, 125-126, 129-131, 132-133, 135-136.

and must be popular. The king treated commerce and the manufacture of money as monopolies, both of which he could abuse to his personal gain.¹⁰ In the Carolines, the priest is the real leader of the council, for all decisions depend upon his revelations.¹¹

As in many another social form, so in the matter of checks on monarchy, the evidence given unpremeditatedly in Homer is copious and typical. The king was the highest power in the government, but he cared for his popularity and did not obstinately oppose the will of the people. In fact, he would make a great personal sacrifice rather than incur the people's censure. "The popular assembly, as a means of taking the sense of public opinion, became a distinctive mark of civilisation. . . . The assembly was closely connected with, if not dependent upon, the kingship; its absence was a proof of anarchy, and in Ithaca coincided with the absence of the king; its renewal, as indicative of a reinstatement of law and order, was hailed with joy by the old and wise. The *agorē*, we find, was primarily a meeting for the discussion of questions affecting the *dēmos*, a gathering which apparently any one (probably of kingly rank) could summon; indeed sometimes the people called the king to assembly. The actual summoning was done by heralds. The ordinary assembly was composed of two parties, the people and the *gerontes*, and among the latter sat the king upon a special seat. It can hardly be said, in a modern sense, that the king presided over the assembly; speakers addressed him, or the people, or both, and the right to speak was conferred by the transfer of the royal sceptre, which was handed by a herald to the one desiring to speak. The assembly was held in a regular place which derived its name from that fact; the head-men sometimes sat upon 'polished stones,' and the place was evidently the most frequented part of the community, resembling the mediaeval *Roland* or *Mal*. The assemblies were regularly convened early in the morning.

"As has been said, matters of public interest were the general business of the assembly; the approving or discouraging of the king's projects. On the whole, the assembly seems to have had little or no power of initiative. Telemachus brought his own private need before an assembly, and urged the people to repress the Suitors; a discussion then ensued between the speaker and several of the Suitors concerning the re-marriage of the former's mother. All the people pitied Telemachus, and some were eager to coerce the lawless men, but the superior power and organization of the latter prevented such action. This assembly was evidently an irregular one. We read of another gathering called by the relatives of the dead Suitors to consider plans for taking vengeance, but it also was hurried and irregular. There is no adequate example of the assembly in time of peace, possibly because of the general state of disintegration of government in the Odyssey period, due to long absence of the rulers. War-assemblies, however, are quite numerous in the *Iliad*; and since they were not essentially unlike those of peace, a clearer idea of the latter can be gained by studying the councils of war. The conditions of war, it must be remembered, would tend, on the one hand, to draw the lines of discipline closer and to limit popular privilege, and, on the other hand, to make the head-king more dependent upon a small circle of advisors, the heads of the various contingents. That is, the centre of gravity of the system lay distinctly in the *boulē*, or council of chiefs, an organisation which does not appear to have been clearly

differentiated in time of peace, and which does not occur among the Trojans in any developed form.

"The king's council was convoked in times of great need, and before it the ruler laid his perplexities and asked advice. The deliberations were usually accompanied by a feast, and the calling of such a council might be suggested by a sub-chief. The proceedings of the council were devoid of ceremony, except that the speaker stood while addressing the company. It was the king's duty to listen to good advice, though he was not compelled to take it; the *ruling* was the king's affair. Speech in the council was very free; the chieftains often severely blamed the king, who took the reproaches with humility when he had made costly mistakes. The council was not convened on all occasions, but was very much respected by the king, and always summoned when he was in distress. In general it preceded the popular assembly, and prepared the matter which was to come before it, the king depending upon the co-operation of the counsellors, men of maturity and experience, in order to influence the people as he wished. There is, however, no evidence to show that the council was more than advisory in its function.

"The popular assembly or *agorē* was a frequent gathering, perhaps a periodical one. As in the town, so in the camp, the general assembly was held in a fixed place—by the ships of the head-king, though separate nations had their assembling-places and public altars by their own ships. The assembly was convoked early in the morning by the king or by some chief, generally through the agency of 'clear-voiced' heralds, who summoned the people by shouting. Sometimes the chief himself did this summoning; in times of danger, the heralds and king went about quietly, summoning the men by name. The people gathered with tremendous outcry, and were restrained by heralds into a proper silence. The person who had convened the assembly then arose and explained the matter in hand, after which the question was open for discussion. Permission to speak was symbolised by the holding of a sceptre, probably that of the house of Atreus, and the speeches were very frank. In general, only the chiefs spoke, differing often from the king, and sometimes reproaching him severely before the whole people; it was *themis* to differ with the king in assembly, and he must not be angry. Only occasionally did the king restrict speech or flatly disregard advice; in general he felt bound to respect the wish of the people. Oratory was greatly admired in the assembly, and the effective style was that where words came 'thick and fast.' The counsel of the experienced and aged was most respected; a young man would sometimes urge his nobility of birth as an excuse for his speaking, in council as well as in assembly. The assembly was dismissed by the rising of the king or convoker, though sometimes the people rushed off under impulse.

"The relation of the king and the assembly as governing powers has been indicated in general lines; the assembly was a means of gauging popular feeling, to which a sensible king was prone to conform his action. The sentiment of the assembly was indicated by the silence of disapproval or the acclamations of approval. The popular attitude was the attitude of the '*Tis*' who, in an unofficial manner, communicated his views to his neighbour; the popular mind was awake and prone to express its feelings, and the consensus of many unofficial expressions of opinion constituted the approval or disapproval referred to. The common man might speak in assembly, but the one example of such a practice tends to prove it an exception, and brands it with a certain disapprobation.

The people might split into factions, however, and follow diverse plans and leaders; in general they were, in the assembly, subjected to a discipline and education whose value was well known to themselves. The assembly was an 'ennobler of men,' and though the humblest of the Greeks (*e.g.*, pilots) did not often come to the assembly, they took an interest in the society's vital doings; they were not mere slaves. Before them the king was sometimes forced to humble himself, and upon the people's expression of approval or disapproval regarding a course of action submitted to them, the king was glad to set his stamp of executive assent. Appeals were addressed not only to the king and sub-chiefs, but also to the people; the people had a share in the decision of the larger questions, for the king could not utterly disregard their evident wishes; the smaller questions were confided to the king alone.

"There are two fairly complete descriptions of assemblies and their action in Homer; though they are taken from war-times, the condition of peace can easily be deduced by slight modifications. Both should be studied in detail to gain a clear view of the relations of king and people. Here is no space for even a summary of what is so readily accessible in full, but certain general considerations emerge which may be mentioned. The power of the Trojan assembly convoked in Iliad VII (845-379) appears to have been very limited; proceedings were irregular and undignified and arrived at no result; no assent or disapproval were shown, and the people merely obeyed. There appears to have been no discipline, for one man could defy the will of all those who were day by day suffering and dying in expiation of his evil actions. This instance tends to prove the weaker organisation of the Trojans, and, as far as it goes, supports the theory that Paris was the oldest son and presumptive heir to the Trojan throne. In the Trojan assembly the same question of restitution had often appeared before, and Paris had maintained his position by bribes; such unjust and irregular acts were those which Zeus severely punished.

"The finest example of the relation of king, nobles, and people lies in the complication of plot which forms the introduction to the Iliad. The whole of this story is exceedingly instructive to the social scientist; a few among many points may be selected for special mention. The king, it seems, was not forcibly restrained by the assembly, nobles, or people from courses of action sure to bring calamity; his sin was expiated, without complaint, by the community. Discipline was such that private feelings and ends were subordinated to collective ends, except in the case of the blackest injustice. The king, however, was jealous of great and powerful sub-chiefs and disposed to prove his superiority by an abuse of power entrusted to him. The sub-chief, on the other hand, was jealous of the ascendancy of a man inferior in strength and bravery to himself, envious of his riches and prerogatives; the king could not, however, force this sub-chief to serve in war if he wished to retire. He was quite willing to dispense with a personality greater in the people's eyes than his own, with little thought of the consequences. By the sequel, *i.e.*, the ruling of the gods, the king's actions were judged, but not by the assembly or council; the king was *the* power, even in a confederation apparently of peers. But there were limits beyond which he could not go and still preserve the sacredness and inviolability of his person. In this episode the superiority of the king over his inferiors is set forth in the case of Calchas; in times of violence a common man was not safe unless he was under the protection of some one who possessed power to defend him. Dependence was better than freedom. If the power of

the chief of a confederation was so strong over his sub-chiefs and people, it must be supposed that a like relation obtained upon a smaller scale. The rule of the king was a matter of force, and its perpetuation a matter of the maintenance of real power; tyranny can be supported if the tyrant can enforce order. Council and assembly were means of assuring such predominance."¹²

The Homeric case is typical of many, though it is more highly developed than that of most savage tribes and less differentiated in its organization than that of the real state. It is a fair parallel to that of the ancient Germans, where likewise the warrior-body and the assembly were one.¹³ Standing midway between the undeveloped and the highly developed forms, it becomes, by reason of the relatively full evidence concerning it, justly representative of the relations between barbaric kings and their peoples. Particularly does it exhibit the various agencies for controlling the one-man power, from the unorganized checks existing in the mores and in tradition up to real institutional forms such as the council and assembly.

§161. Secret Societies.

THE more distinctly religious types of secret societies will be considered first. These societies are very common in West Africa, and in northern Cameroons are said to spring up "like mushrooms after a spring rain. Unfortunately they also disappear again just as fast, without being rescued to science." Strangely enough, they do not occur on the Gold Coast. Frobenius,¹ whose work teems with cases, thinks they belong to the West African culture-area and are relics of an older "Malayo-Negrito" system.

A number of authors furnish details concerning the African societies. "Every West African tribe has a secret society—two, in fact, one for men, and one for women. Every free man has to pass through the secret society of his tribe." But there are no mixed societies. "Those that I have mentioned . . . are all male, and women are utterly forbidden to participate in the rites or become acquainted with their secrets, for one of the chief duties of these societies is to keep the women in order. . . . A man who attempts to penetrate the female mysteries would be as surely killed as a woman who might attempt to investigate the male mysteries." Other societies "are practically murder societies, and their practices usually include cannibalism. . . . In the Calabar district I was informed by natives that there was a society of which the last entered member has to provide, for the entertainment of the other members, the body of a relative of his own, and sacrificial cannibalism is always breaking out, or perhaps I should say being discovered, by the white authorities in the Niger Delta." There existed a terrorizing society called the "Human Leopards, because when seizing their victims for sacrifice they covered themselves with leopard skins, and imitating the roars of the leopard, they sprang upon their victim, plunging at the same time two three-pronged forks into each side of the throat. . . . Sometimes, instead of the three-pronged forks, there are fixed in the paws of the leopard-skin sharp-pointed cutting knives, the skin being made into a sort of glove into which the hand of the human leopard fits. In

¹² Keller, *Hom. Soc.*, 259-268 (where copious references to the text are cited).

¹ *Masken*, 75 (quoted), 95, 243.

one skin I saw . . . this was most ingeniously done. The knives were shaped like the leopard's claws, curved, sharp-pointed, and with cutting edges underneath. . . . In the districts I know where human leopardism occurs . . . the victims are killed to provide human flesh for certain secret societies who eat it as one of their rites.² Lots are drawn to determine upon the member who "has to provide a victim who can be taken without fear of discovery. So important is this part of it, that they often fix on wife or child as involving the least possible risk. The murderers are then told off, and, dressed in leopard skins, they hide themselves in the thick bush, from which they leap out on the unsuspecting woman or child, digging into their necks a horrible little instrument with three pointed blades, specially made so that the wound they inflict should exactly resemble the claws of a leopard."³

The members of the Jevhe society are under taboo with respect to certain foods, actions, and usages; also with respect to rain-water from roofs and, at times, brandy.⁴ Secret societies are general among the Yorubas and exist, under the same names, among negroes of Yoruba descent in the Bahamas. The members of one of them "meet every fifth market-day and pay their subscriptions, each member in turn taking the whole sum contributed at a meeting." Their method of reckoning market-days results in a sort of seventeen-day cycle. "These clubs or societies are so common that the seventeen-day period has become a kind of auxiliary measure of time."⁵ It is reported that if a member of one of the secret societies "feels his death approaching, the rest are in the pleasant situation of having to kill and eat him, so that he may, so to speak, live on in his fraternity brothers."⁶ On the lower Congo the initiation includes circumcision. The members of the society form a sort of free-masonry possessing certain pass-words or signs. The ceremonies last for six months and are repeated as the novice attains higher grades. They do not bathe during the six months. They are taught a new language by the medicine-man, which seems to be quite different from the ordinary tongue and is not taught to females. During the initiation-period they are sustained at the expense of the community. When the society is on the road its coming is announced by a sort of drumming noise, and all those who have not been initiated must clear out of the drum.⁷

Secret societies occur in China; otherwise they are not so numerous in Asia.⁸ The religion on the island of Ponapé was in charge of chiefs who formed an hereditary society to which other selected persons were admitted upon qualifications—knowledge of the peculiar language of the society, of its customs, ceremonies, and prayers. The outward sign of membership was long hair which was never cut but only singed off. This was done to all members except the two chief ones when any member died. There was an annual festival, a consecration of all new canoes, and a visit to a big sea-serpent alleged to be on a certain island.⁹

There is great variety in the nature and purpose of American societies. Some are military in character, others appear to be merely convivial. Many are connected with health, possessing certain therapeutic knowledge which is obtained

only by initiation. There were two classes of societies among the Omaha: social and secret. "Membership in the social class was open to those able to perform the acts required for eligibility. To this class belong the warrior societies as well as those for social purposes only. The secret societies dealt with mysteries and membership was generally attained by virtue of a dream or vision. Some of these secret societies had knowledge of medicines, roots, and plants used in healing; others were noted for their occult and shamanistic proceedings and furnish the only examples of such practices in the tribe. There were no societies composed exclusively of women."¹⁰ The right to a position in some of the secret organizations might be acquired for one's self "by killing a person of some foreign tribe and taking his paraphernalia, or for one's son by marrying the daughter of him who possessed it." Cannibalism sometimes plays a part; among the Tsimshian there existed a Cannibal Society. Initiation, accompanied by ordeals, was usual. "At the time of initiation the novice was supposed to be carried away for a season by the spirit which came to him, and after his return he usually went through the different houses in the town accompanied by other members of the society who had been initiated previously. In case his spirit were a violent one, he might break up boxes, canoes, etc., which the giver of the feast had to replace." Among the Zuni, one of the ordeals to which an initiate into the Priesthood of the Bow was subjected was to sit naked for hours on a large ant-hill, his flesh exposed to the torment of myriads of ants. When introduced into one of the Omaha societies, one was shot in the Adam's apple by something said to be taken from the head of an otter. A person initiated into the Chippewa and Menominee society was "shot" with a medicine bag and immediately fell on his face. On the northwest coast, the secret society spirit or the guardian spirit of the shaman also made himself felt by causing a candidate to fall on his face. During the ceremony among the Hidatsa, devotees ran arrows through the muscles of different parts of their bodies, while the special ordeal of a Cheyenne society was to walk with bare feet on hot coals. Those initiated into the mysteries of the sacred trumpet in Guiana were subjected to flagellations, fastings, and other painful exercises.¹¹

In some parts of America the clans are secret unions with initiation by the medicine-man for both men and women. The medicine which each clan uses is its bond and is a secret from all others.¹² This is really a secret, religiously bound kin-group. "The tendency of the Iroquois to superstitious beliefs is especially exemplified in their notion of the existence of a race of supernatural beings, whom they call False-faces. . . . The False-faces are believed to be evil spirits or demons without bodies, arms or limbs, simply faces and those of the most hideous description . . . and possessed of a look so frightful and demoniacal as to paralyze all who behold them. They are supposed to have power to send plagues and pestilence among men, as well as to devour their bodies when found, for which reasons they were held in the highest terror. . . . Upon this belief was founded a regular secret organization, called the False-face band, members of which can now be found in every Iroquois village . . . where the old modes of life are still preserved. This society has a species of initiation, and regular forms, ceremonies, and dances. . . . If any one dreamed he was a False-face . . . it was only necessary to signify his dream to the

¹⁰ Fletcher and LaFlesche, in BAE, XXVII, 133, 459 (quoted).

¹¹ Boas, in BAE, XXXI, 546-547; Swanton,

¹² Schoolcraft, *Hist. Ind.*, II, 171.

proper person, and give a feast, to be at once initiated; and so any one dreaming that he had ceased to be a False-face, had but to make known his dream and give a similar entertainment to effect his exodus. In no other way could a membership be acquired or surrendered." Members wore hideous masks when appearing in character. They were all males save one, who was the mistress of the band and called the "Keener of the False-faces"; she "not only had charge of the regalia of the band, but was the only organ of communication with the members, for their names continued unknown. The prime motive in the establishment of this organization was to propitiate those demons called False-faces, and among other good results to arrest pestilence and disease."¹³ Thus public service was one of the objects of even so strictly religious an organization. There were two secret societies among the Lenape: one, called the Witches, was composed of twelve malevolent conjurors, all holders of the "bad medicine," while the other, comprising twelve benevolent shamans, was known as the Masks, and was quite similar to the False-face company of the Iroquois. Both had stated meetings and rites.¹⁴

The Dakotas had "medicine-lodges" and religious unions with secret rites which Schoolcraft called "clans."¹⁵ On occasion "a council is held by the head-men of the order, who appoint to act as soldiers ten members of the order, who . . . erect a three-foot barricade . . . preserve order, wait upon the dancers, prevent spectators from leaning upon the barricade, and attend to a large cauldron of meat and wild turnips cooking over a fire." A novice is given secret instructions, stripped and painted black from head to foot, except for a small red spot between the shoulders. He is exhorted to remain good so that his medicine shall be strong and to give a feast once a year, and receives the holy claw or stone. The medicine-man transfers to him the spirit from his medicine-bag, at which the candidate falls upon the ground. The priest resuscitates him, he gets a medicine-bag, and is a recognized member of the order. "Dead Indians, men and women, are initiated into this order, through the same performance over a lock of hair of the deceased. . . . They say the spirit by this initiation is set on the right road, straight to his or her destination." The living candidate has to participate in a dance, "and as these dances are given, even in mid-winter, many degrees below zero, one can readily imagine the agony the candidates must undergo, clothed only in a coat of paint. It is generally supposed that the members of the order have secrets and signs, but the penalty is so sure and swift that no exposures have ever been made. Well-known instances have occurred where indiscretions of members have been punished by their mysterious disappearance, attributed to the medicine-men."¹⁶ The Osages have secret societies which keep their myths secret.¹⁷

"Since the advent of the Paiute messiah, 'Jack Wilson,' a new society has been organized, designated as the 'Dreamers' society'; it is a remote imitation of the ghost-dance, a craze of which many discontented and belligerent young men of various tribes took advantage to further their own designs. When a child who has been set apart to be dedicated to the Ojibwa Ghost Society dies before reaching the proper age of initiation, there is a feast at the mourner's wigwam, with dishes set apart for the dead, and the chief mourner is initiated

¹⁷ Dorsey, in BAE, VI, 377, 396.

as a substitute for the deceased. The Ojibwa have a society of medicine-men of four classes. "Frequently the collecting of skins, peltries, and other goods that have to be purchased involves a candidate hopelessly in debt. So great is the desire, however, on the part of some Indians to become acknowledged medicine men that they will assume obligations which may take years of hunting or work to liquidate. If they should finally fail in this, their relatives are expected to assume the responsibility." The Menomini Grand Medicine Society consists of men, women, and a few boys and girls. Initiation may be accomplished through adoption by a member to fill a vacancy caused by death, or by submitting proofs of eligibility and paying the necessary presents and fees. Before initiation the candidate "is taught the mysteries of the remedies known to his instructor. Each remedy must be paid for separately, since no two preparations, roots, or other substances are classed together as one. Furthermore, the knowledge relating to different remedies is possessed by different medicine men, each of whom will dispose of the properties and uses thereof for a consideration only." At a service for the benefit of a shade of a dead member who had been allowed to return and be present at the meeting, a spirit is quoted as saying: "Whenever you are in trouble, place some tobacco aside for me, and when the odor of your smoke ascends I shall help you." One of the ways to show regret for unmindfulness of the injunctions and precepts taught through the ritual is to give a ball game. Such a game is given sometimes when a member of the family is sick; "this offering being equivalent to giving to the poor." A feast must go with it, like the bread with the circus in Rome.¹⁸

Boas¹⁹ goes into considerable technical detail concerning the secret societies of the Kwakiutl Indians, remarking on "the wide distribution of secret societies and the general similarity of the underlying principle all over North America. . . . I believe the source of the ritual, as well as of the legends which are connected with it, must be looked for in the advantages and the prerogatives which the membership of secret societies gives." Men were led by desire for these to acquire membership in existing societies or, where these were not sufficient, to create new ones. "Of course I do not mean to say that the Indian invented traditions consciously and intentionally, but that the desire excited his fancy and his whole state of mind, and that in this manner, after appropriate fasting, the opportunity was given for hallucinations, the material for which was necessarily taken from the existing ideas, or from the ideas of neighboring tribes. . . . It is easily understood how the exciting aspect of the ceremonial of the cannibal society caused a young man who had gone fasting to believe that he saw in his hallucinations the same spirit under new conditions, and to tell of his experience after his return. As the notion had become established that the spirit, after having been seen, had a tendency to reappear to the descendants, an opportunity was given for the formation of a new place in the secret society." Boas thinks "the origin of the secret societies has a close connection with warfare."

The Zuni child, becoming a member of the society at a tender age, is led to believe the impersonators of the gods are the gods themselves. Initiation is accompanied by whipping. The priest lectures the boys, imparting some of the secrets of the order; and the boys are told that betrayal will be punished by decapitation with a stone knife. Initiates get masks which are their personal

¹⁸ Hoffman, in BAE, VII, 164; Hoffman, in BAE, XIV, 63, 67, 68, 69, 77, 78, 127.

¹⁹ In USNM, 1895, 660 ff.

property and are buried with their owners so as to accompany them to the other world. "When a man dons a mask his body becomes the abiding-place of the spirit of the god and he is worshiped as such."²⁰

The Pueblo *kivas*, or ceremonial chambers, with altars and fetishes displayed in them, were built in good part "by religious societies, which still hold their stated observances in them, and in Oraibi several still bear the names of the societies using them. A society always celebrates in a particular kiva, but none of these kivas are now preserved exclusively for religious purposes; they are all places of social resort for the men, especially during the winter, when they occupy themselves with the arts common among them. The same kiva thus serves as a temple during a sacred feast, at other times as a council house for the discussion of public affairs. It is also used as a workshop by the industrious and as a lounging place by the idle. . . . The kiva is usually spoken of as being the home of the organization which maintains it. Different kivas are not used in common by all the inhabitants. Every man has a membership in some particular one, and he frequents that one only. . . . In each kiva there is a . . . kiva chief, and he controls to a great extent all matters pertaining to the kiva and its membership. This office or trust is hereditary and passes from uncle to nephew through the female line—that is, on the death of a kiva chief the eldest son of his eldest sister succeeds him. . . . But the kiva chief is not necessarily chief of the society; in fact usually he is but an ordinary member. . . . A kiva may belong either to a society, a group of gentes, or an individual."²¹ The Moki have a secret society, but they would not tell what it was for.²²

A discussion of Melanesian secret societies, adapted in the main from Rivers,²³ may serve to introduce the topic of the regulative functions of such organizations. There is a close resemblance between the Duk-Duk society of the Bismarck Archipelago and the Tamate societies of the Banks Islands. "Both are societies consisting of initiated men meeting secretly in the bush and wearing masks, especially when their members come into relation with the uninitiated. The belief that the members represent the ghosts of the dead is almost certainly common to both, and both possess the power of protecting private property by means of taboo." Closely connected with the belief that the members of the societies are ghosts is the frequent occurrence, in the ritual of initiation, of features which point to this process as being symbolic of death and re-birth. "Thus, in Melanesia, a candidate, who leaves his family in order to be initiated, is mourned for as if he were dead, and there are frequent features of the ritual which point to its being in a large measure a symbolization of death." In addition to the features which bring these associations definitely into the category of religious groupings, there are other features of a political kind. Thus, "wherever these organizations are found in Melanesia, there is nothing which can properly be called chieftainship, the place of the chiefs being taken by men of high rank in the organization. Or, these men of high rank may be regarded as chiefs, in which case the rank of chief is not hereditary, but is attained by a process of successive initiations. Since men only attain this rank by a lengthy process, the rulers are necessarily old men, thus producing the mode of government which has been called a gerontocracy. In

Melanesia, at any rate, there is a close association between this form of government and the existence of graded organizations entered by initiation." The economic significance of these organizations is evidenced by the fact that almost the only function of shell-money and money of other kinds is in connection with these societies, in the payments which accompany initiation and the attainment of higher ranks. Another economic function of the organizations, at least in the Banks Islands, is that they form the means by which the right to individual property is acquired; in opposition to the general communistic practices, each society has a badge by means of which property is protected from all except other members of the same group. Webster²⁴ has endeavored to show that secret societies in Melanesia and elsewhere have arisen through a special development of totemic clans. To this hypothesis Rivers makes an addition designed to explain the fundamental feature of the societies, viz., their secrecy: that Melanesian secret societies embody the religious cults of immigrants who, coming in small numbers among an alien people, practised their religion in secret, and only gradually admitted the indigenous people to participation in their rites. Secrecy, then, is due to the need felt by the immigrants for the practice of their totemic rites away from the alien population among which they found themselves. The extreme development of secret societies, as in the southern islands of the Melanesian Archipelago, seems to be connected with the decline of totemism as a social institution: the formation of bodies which enroll their members from all parts of the tribe, irrespective of clan-ties, must contribute to the disintegration of the clan-structure.

There is hardly a feature of the associations of Melanesia which is not reproduced in one or other of the societies of Africa, while there are certain African features which do not occur, or are exceptional, in Melanesia. Thus among the Ibo, there is in some cases a connection with occupation, the societies resembling guilds. It is noteworthy, in relation to the position of smiths elsewhere in Africa, that the highest grade among the Ibo is named after the blacksmiths.²⁵ Frobenius²⁶ adverts to the Melanesian societies in connection with the African. We shall follow his cases to begin with. In relation to the Melanesian societies he cites the fasting-period, which extends to a hundred days, and the renunciation of bathing which accompanies it. The candidate is thus spiritualized and re-born, getting a new name. Grades of spiritualization are attainable, the highest receiving honor as to the gods; but rising in the scale costs heavily. The more strictly regulative features of the African organizations, though bound up with religious notions, are indicated in the following examples.

In Loango the secret society attends to the matter of rain and also serves the king as a force to execute his will. It is particularly efficient in collecting debts or wreaking destruction on the property of the debtor. Sometimes the king is president of the local society; and regularly the societies terrify women and children and keep them in order. "The land remains, as it were, in a permanent state of siege, which is necessary by reason of the preponderant number of slaves and women." The recurrent "Egbo-days" are days of martial law, on which the traditional life is suspended in favor of general repression. "As soon as an Egbo-day is announced, slaves, women, and children flee in all directions,"

²⁴ In JAI, XLI, 507-508; Rivers, *Melan. Soc.*, II, 222.

²⁵ Rivers, *Soc. Org.*, 126 ff.

²⁶ *Masken*, 251 ff.; 57, 60, 85 ff., 93 ff.; 103 ff., 114 ff., 133, 135, 138 ff., 145, 227, 232.

seeking to avoid the whip which the emissary of the society plies with little scruple. The Order of the Free Egbo started in certain market-places, it is reported, as a sort of House for the mutual guarantee of merchants' interests, "and later won the political significance of a Vehm, by drawing into its power the whole police-function of Calabar and the Cameroons." But "the Egbo laws aim only at the weal of its own members, in comparison with which the general well-being is not considered. The Egbo-tribunal must be well paid for rectifying injuries; sometimes people prefer to sell themselves in slavery to some powerful chief. "Like all exclusive societies, the Egbo will not willingly sacrifice the preferential rights of its members in favor of humbler people. What they have they hold tightly to. . . . Women, if they have not powerful fathers and brothers, must put up with the most humiliating treatment from their husbands. The only law which the society ever promulgated for the protection of slaves was given at the instance of foreigners."

Among the Yorubas the "Egungun" is regarded "as a sort of supernatural inquisitor who appears from time to time to investigate the general domestic régime of the people, especially that of the women, and to requite punishable actions. Although it is generally known that Egungun is only a selected man, yet it is believed among the people that to touch him is to invite death." Thus is the matter of private order attended to by an alleged daimon connected with the dead ancestors. The Ogboni society sends out a masked "Oro," who "is the public police-force, if one may so express it." His approach is heralded by the hum of the whirr-stick, at the sound of which all women must retire to their apartments. No one of them may see the bull-roarer itself. "The whole of Yoruba-land is ruled by this society or this authority organized in society form. Criminals condemned to death are given over . . . to the Oro." It is thought that Oro, "who is now only the guardian of the public order, as Egungun is of the private, was originally the spirit that directed the education of the boys"; he seems to be the spirit of the ancestors.

The Jevhe is another of the West African societies. It has a sort of cloister, and its fetishes, kept in a brandy-chest, are so-called "lightning-stones"; there is also an altar, blood-besprinkled and decorated with white chicken-feathers. Sacred implements, preserved in the dark interior of this holy place are two drums and an iron called "gongo." Members can lead an unrestrained life within the temple; and all the rights of the outside world are extinguished as regards one who treads the holy ground. "The believer may demand back no debt, the man no wife, the parents no child. While they lose all their rights in favor of the members of the Jevhe-association, there accrue to them, on the other hand, a mass of the most extensive duties, which they must fulfill, not alone to the members of their families residing in the cloister, but also to the rest of the Jevhe-members." Men deep in debt may be brought by their relatives to the capital and, at the chief's command, be struck dead or buried alive. Such debtors flee, if they can, into the Jevhe-sanctuary, and the priest announces that Jevhe has taken them. If the creditors dare then to press their demands, the debt having been, so to speak, outlawed by the god, they are likely to have to pay to the society the exact amount of the indebtedness. Men also enter voluntarily in the hope of getting a wife. The novice eats with the priest and a common member, called an "older dog," a brew of white chicken's blood and meal, and then enters into all the secrets. Girls can be entered by appeal to the priest. A female candidate is spirited away to the cloister; she goes

through an initiation, including the shaving of the whole body, and gets a new name. She may not leave to get water or wood until the priest is sure that she has lost all feelings of affection for family and friends; but "after the completion of her education she may leave the cloister and go back to her people." So may the married woman return to her husband; but she remains more closely attached to the Jevhe institution than to anything outside. She must often return and attend to the duties of cleaning and getting wood and water for the cloister. If this results in strife with her husband, the latter is fined about a hundred marks [about twenty-five dollars], the sum being doubled and tripled if he does not pay up at once.

These Jevhe-associates, along with other duties, practice espionage. Priests and chief are hand in glove; the chief helps out the society and is well paid for it, and the priests can go their own way undisturbed by him. Creditors too can make use of the offices of the society. If they cannot collect, after repeated efforts, they take whiskey to the priests and ask aid. If the gifts of intoxicant are large enough, the brother of the debtor—not the man himself—is seized. Then the debtor is under obligation to buy his brother off, at a total cost represented by the amount of the debt, the cost of the whiskey, and the compensation of the abductors of the brother. It is to be noted that the society is ready to espouse either side of a debt-controversy that redounds to its profit; but the net result is some kind of a definitive settlement of extreme and long-drawn-out controversies.

In Senegambia, to continue with the lists of Frobenius, the chief of the secret society, who prescribes laws, lives in the forest and is always unknown to those who do not know his mysteries. In case of debts or thefts, complaint is made to him by offerings to a wooden fetish and the discharge of a flintlock at its feet. In Sierra Leone there are five districts each of which has its own authority and special government, but all are under a common secret society, with typical initiation, masks, tattoo-marks, and ceremonies. The chapters of this fraternity are the local tribunals and the chief chapter the general one. The former keep peace between the strongest families, compose local quarrels, and may also end wars between the districts. The general tribunal ends wars and punishes by death the spilling of a drop of blood after its proclamation is rendered. The guilty district is sentenced to a four-days' pillage, half of the product of which goes to the plaintiff-district and half to the general tribunal, which shares its part with the pillagers. If any family becomes too powerful the great tribunal sentences it to a nocturnal pillage by masked warriors. If the heads of the family resist, they are killed or spirited away, to be judged in the forest-depths, and almost always to disappear forever.

There is, in parts of West Africa, a special attempt at the safeguarding of husbands' rights, which seems not uncalled for in these regions of much intercommunication and trade. Women are stripped and severely chastised, at the instance of a monster called "Mumbo-Jumbo," for quarreling and other unseemly conduct. Masked men keep guard of the public order. Circumcision of novices is widely practised. Most of the African masked societies have also the function of joke-making and trick-playing. "Not only to become satisfactory husbands, but also good citizens, do the youths visit the solitude of the forest. The group of those thus educated together then readily takes on the character and significance of politically organized bodies. The uninitiated are "unclean,

unholy, know-nothings, unintelligent, have nothing to say in any assemblies, and must take shame to be present at any councils."

"Thus there sound forth in the several melodies of the African secret societies all the motives of social life. In Egbo the despotism and hierarchy of the merchant is suppressed. The Purrah sets itself against the little-state system. The Mumbo-Jumbo drives coquettish women before him. The Belli educates good husbands, citizens, and soldiers. . . . In Jevhe is presented a memorial of the hateful transitional form which comes out where the Christian and European philosophy forces the savage to deceit, because he can not renounce his fathers' customs and views and yet can no longer attach value to his own ways. Of no one of these currents can it be said that it gave life to the secret societies. Only the direction of the orders, already in full, powerful development, was influenced. . . . That rude, primeval force, the spirit-world, was bridled and trained until, as a driving factor in the state-machine, it attained a field of activity rich in effectiveness and widely-branching."

So much for Frobenius. We turn now to other African examples and to cases from other parts of the world. Among the Fan the secret society gradually became legal and by force of circumstances one of the most vital organizations of the tribe.²⁷ The principal elders of the Akamba tribes, who form in fact the government of the country, are mostly old men who have attained to the higher degrees.²⁸ In Loango masked persons appear as executioners of the arbitrary and violent orders of the chief; but there is a secret, hereditary vigilance-organization which enforces the payment of debts, sending its agents to seize property on complaint of a creditor.²⁹ Unpopular persons are fallen upon and flogged with the sacred whip.³⁰ In Togo there is a society, of which Klose³¹ gives a long account, which practises oppression, extortion, licentiousness, and terrorism. The Nigerian Idem is "a body of men formed for the purpose of governing the clan, household, or family to which they belong." The head of the house is always president. Its evil character is largely exaggerated.³² Andree³³ collects other African examples.

In China, "the many secret associations existing among the people are mostly of a political character, but have creeds like religious sects. . . . They are traceable to the system of clans, which, giving the people at once the habit and spirit for associations, are easily made use of by clever men, for their own purposes of opposition to government." The people naturally connect some religious rites with their opposition and cabals in order to more securely bind their members together.³⁴ An illustration is given by the so-called "Boxers," who taught that proper initiation into mysteries would render its members invulnerable. They pretended to prove this by experiment: "several intelligent Chinese have told me that they had themselves seen advanced members of the society strike different parts of their bodies with sharp knives and swords with no more effect upon the skin than is produced by the wind." Death is easily explicable; in one case it was discovered that several Boxers who were killed "had broken the rules of the society by eating certain proscribed articles of food. In this way their death but strengthened the faith of those remaining. It was proposed at first to use no fire-arms in the extermination of foreigners,

but to trust to the sword alone. Great reliance was placed on certain calisthenic exercises and posturings which were expected to hypnotize or terrify the enemy."³⁵

The *kongsi*, or Chinese republic, which formerly existed in the western part of Borneo, was closely related to the secret societies. The Chinese went to that distant, unknown land knowing that they would be received with open arms and helped on. They migrated in groups, chiefly of family-members and village mates. The term *kongsi* is applied to great corporations and commercial houses, but as the term for a political body means "union for the object of managing the *res publica*."³⁶ Among the Alfurs of Ceram there is a union having the alleged purpose of warding off foreign control, but it has become an institution whose most important purpose is to smooth over quarrels without the intervention of the government. Every member has a cross tattooed on his breast.³⁷

The order of the Arreoi, on Tahiti, Raratonga, Nukuhiva, Hawaii, and the Ladrões, was in part religious, but also social. In the end it was only a means of living in vice and luxury, but originally it carried purity of color to the extreme. It was advantageous to the ruling class, and consisted of a voluntary union of warriors of the superior race, who agreed to let no children of theirs live; only the offspring of the highest group in it survived in order to perpetuate the race in its highest purity. As they lived on the subjugated race, whose surplus was limited, this holding down of numbers maintained their power. In Hawaii, the practice of infanticide had reduced the number of females in the society to one-third that of the males; hence the men were forced to take women of the lower race, and, as their children were killed, polyandry ensued. The society was dissolved about 1800 by the king, Pomare II. On the Society Islands this union was attributed to divine foundation. There were seven grades of tattooing, but all were united in close comradeship and their hospitality to one another had no limit. They did not labor; their land was cultivated by slaves, and their souls taken by the gods to paradise.³⁸

Among the Dakotas, "the circling crow dance, also called the straw or grass dance, is controlled by three men, the most influential of the tribe, who wear a peculiar insignia, a tunic of crow and eagle feathers attached to a belt ornamented with beads and quills; over the small of the back project two sticks several inches long; at the ends are jingling bells, every motion of the wearer causing the sticks to vibrate and the bells to jingle. These tunics are held sacred, and no profane hand allowed to touch them. . . . Stewards are appointed to collect provisions, which are rarely refused. When sufficient is collected to last several days, the three leading men are notified, who, calling the lodge, make arrangements for the dance. The crier then goes through the camp announcing when and where the dance will be held. . . . Seating themselves upon the ground, wrapped in their blankets up to the eyes, the drummers open the ball, the dancers throw their blankets aside, and springing to their feet brandish their tomahawks or knives with violent gestures and an occasional whoop, chant and dance for a few moments, resume their blankets and their seats, leaving one in the ring, who, fiercely gesturing, and wildly waving

³⁸ Webster, *Secret Soc.*, 164 ff.; Lippert, *Kgchite.*, I, 212, 214; Ratzel, *Vhde.*, II, 195; Cook, *First Voy.*, in *Pinkerton, Coll.*, XI, 520.

a tomahawk or knife, will brag unmercifully over some exploit in war or chase; again all jump up, dance and yell. A repetition of the same performances is gone through with again and again for several days or until the provisions are consumed. They will imitate animals, taking raw meat or a fish, snarl, growl, and snap over it, tearing it with their teeth like the wild beast they are so well imitating. . . . A question of importance once decided, the head chief of the band will be called in, whether a member of the lodge or not, and he must perform the mission they have intrusted him with, and as their influence is largely kept up through these orders the chiefs are glad of these commissions. There are no signs or passwords, and with the exception of the skunk-skin garter, elaborately ornamented with beads, there is nothing to designate the members from the outside world. Though this order is of late date, it is the most powerful among the Indians. . . . There are no ceremonies of initiation; they generally give a horse, starting him off with a whip, for any one who chooses to catch him. The order is a charitable one. An old woman called on the order, stated her poverty; immediately the crier was sent around the camp, and in a few hours the members were all present, as they will drop any work or pleasure when called. The leader stated the cause of the meeting; the result was flour and pork, thirteen blankets, calico, fine cloth, and skins. Another instance: An Indian, wishing to build a house, invited the order to a feast; as he was not a member one stated his wants. After the feast the building was soon completed. Though a charitable and social society, it is one very much feared; and there exist lodges among all the different tribes and bands throughout the great northwest."³⁹

Boas⁴⁰ describes the so-called winter ceremonial of the Kwakiutl Indians. All the officers of the ceremonial and their names "derive their origin from a myth telling how the animals held their first winter ceremonial." At the time of marriage, a bride's father "has promised to transfer his membership in one of the secret societies to one of his son-in-law's children. When a son of the latter has reached the age of 10 or 12 years, or even earlier, he is initiated in one of the lower secret societies," through which he must pass to become a member of the higher ones. The celebration of this initiation is exceedingly expensive and the three principal chiefs of the tribe investigate the debts and property of the man and his father-in-law beforehand, to be sure the expenses can be met. Permission is given if the result is promising, and there is a meeting of all the chiefs to ratify. "At this meeting, the man who gives the dance notifies his father-in-law that he desires to have the blankets which he paid for his wife returned, and that he wants to have the box containing his father-in-law's dance." Notification is made to the tribe to prepare for the ceremony; "in particular, they are asked to clean themselves and to refrain from intercourse with women." The ceremony itself is a presentation of the amount of property to be transferred.

In California a secret society existed in one of the tribes, the membership of which, "in conversation with their white acquaintances, make no secret of the fact that it is designed simply to keep the women in due subjection." One of their number impersonates the devil, being painted in alternate stripes of red and black, spirally. He is so masked by a hanging chaplet that he is not recognizable, and rushes out with pranks and capers and dreadful whoops while the

³⁹ Beckwith, in *Smithson. Rep.*, 1886, pt. I, 248, 249.

⁴⁰ Kwakiutl, USNM, 1895, 500-502.

assembly hall he has just left resounds with diabolical yells. He carries in his hand a sprig of poison-oak, with which, dipping it in water, he sprinkles the faces of the squaws as he pirouettes about them; "whereat they scream with terror, fall prostrate upon the earth, and hide their faces." Other "devil-dances" are practised by these Indian tribes to the same end of terrorizing the women; and an old chief in the end preaches to them on feminine obedience, industry, and chastity. They kill the women of their conquered enemies because thus they think to kill out the other tribes.⁴¹

Military and age-societies were frequent among the Indians. There were the progressive age-societies of the Plains and the permanent warrior-system of the Forest, by which latter a man, a woman, or a child performing a brave deed, automatically became a warrior for life. "The soldiers' lodge was erected in every band or tribal camp, and there the qualified braves resided with the chief."⁴² The organizations of the Crows were, apart from their military character, essentially social associations similar to the four bodies of the present day, which join in the performance of the Grass Dance on certain occasions and otherwise have the functions of clubs and mutual-benefit brotherhoods.⁴³ Among the Cheyennes the soldier-bands included a large number, but not all, of the able-bodied and ambitious men of the tribe, from youth to old age. "They were the organized military force of the camp, and acted as its police force. To them was intrusted the enforcement of the orders of the chiefs. Since, in the Indian camp, public opinion was the ruling force, and since the soldiers constituted a majority of the bravest and most influential men in the tribe, the soldier bands were often consulted by the chiefs on important matters relating to peace or war. Sometimes one or more of these societies, acting unitedly, might force the tribe to adopt some certain course of action that it was not generally desired to take, or might even oblige some priest or important man to perform an act that he felt to be wrong or to threaten harm to the tribe."⁴⁴

§162. Clubs.

THE secret society and the club are institutions of the same general type, though each has a number of special features which warrant separate treatment. "Where membership of the group is limited to male persons, it is natural to find that the associations are closely connected with the institution of the men's house, that is, a house common to men, in which the men of the community, or the initiated men, dwell, eat and sleep. . . . In some cases all the men sleep in the common-house, while more frequently only the bachelors sleep there, the married men sleeping in their own houses with their wives and families."¹ The men's house is a common feature in Melanesia. In every village of the Banks Islands there is a building called the *gamal*, which is used by men only, "and it is in this building only that men sleep and take their food." Each man sleeps and eats either in the compartment of his own rank or in one belonging to a rank lower than his own. The *gamal* is also the general meeting-place in the village.² Among a number of other Melanesian peoples such club-houses are common, serving as meeting-places for the men of the

local group, as halls to receive and entertain chiefs and strangers on official business, and in general as club-houses in the fullest sense of the term. They are always tabooed to women.³

"In all Melanesian groups it is the rule that there is in every village a building of public character, where the men eat and spend their time, the young men sleep, strangers are entertained; where as in the Solomon Islands the canoes are kept; where images are seen, and from which women are generally excluded. . . . But these are not club-houses, as are the *gamal* houses of the *Suge*, which serve indeed to a considerable extent for public purposes, because almost every man is a member of the club, but are in fact the homes of a society in which every one has his place according to his rank in the society. . . . Nothing is known of the origin of the club. It is not connected with the secret societies of the ghosts, and is not a secret society of the same kind. The club-house is in the open, and every one, except when new members are admitted, can see what is going on, though women are most strictly excluded. It is a social, not at all a religious institution. The giving of feasts advanced the rank of the society-member, and he gave prizes and otherwise exhibited his liberality. "It was a great thing for a man to have a large assemblage at his feast, and a great satisfaction to his enemy to prevent it; each would therefore use charms to further his purpose." A place in the society was in old times valued for the advantages it carried with it after death. According to a native, "the reason for *Suge* is this, that hereafter when a man comes to die, his soul may remain in happiness in that place Panoi; but if any one should die who has not killed a pig, his soul will just stay on a tree, for ever on it like a flying fox. . . . Consequently, on the birth of a son a man's first care was to give a pig in his name to make a beginning of *Suge* for him. . . . Among children even, one whose father had not given a pig for his admission would be despised; and when a man had killed his pigs properly afterwards on his own account his position in society was secured." He could adorn himself with their tusks, which were like the insignia of degrees taken in modern secret societies. "Age has nothing to do with entrance into the society, or with rising in the ranks; it is merely a matter of giving pigs and mats, which serve for money. . . . The higher ranks of the *Suge* give much power and authority, because those who have reached them can always keep back those who wish to rise, and the goodwill of each one of them has to be secured." Discipline is severe; anyone who should intrude into a division above his own would be clubbed or shot. To get the pigs and mats which advance one in the social scale he must have *mana*, or inherent virtue; and the chief, being at the top, is an almost godlike repository of that supernatural quality.⁴

The Nanga of Fiji is thought to be allied to the general Melanesian type of men's club; only here a young man may marry prior to initiation. The men, married and unmarried, assemble in their house in the evenings and sing.⁵ The *fel* of the Mortlock people "is a hotel, a work-shop, a place for keeping the big canoes, a play-ground for the children, a place for the holding of all assemblies. . . . All state-business is transacted in this house, all visits received here; chiefly, however, it serves as a sleeping-place for those young

⁴ Codrington, *Melanesians*, 102, 103, 110 ff., 299.

⁵ Fison, in JAI, XIV, 30; Crawley, in JAI, XXIV, 231; Weld, in PSM, XLVIII, 231.

male members who are not yet married or are separated temporarily from their wives. In consequence of the small population, as well as of the custom that the men marry away from home, the number of sleepers in the 'fel' is only a limited one."⁶ The council-hall of the Maori was also a guest-house and village sleeping-house.⁷

The Point Barrow Eskimo have a house that will accommodate sixty, which is used in summer as a general lounging-place or club-room by the men. "Those who have carpentering and similar work to do bring it there and others come simply to lounge and gossip and hear the latest news, as the hunters when they come in generally repair to the club-room as soon as they have put away their equipments."⁸ Around Bering Strait the *kashim* is the center of religious and social life for men. The unmarried sleep there always and so do the married except occasionally. Men work there, and the entertainment of guests, the shaman's exercises, the old men's tales, and dances find their place there. Women are excluded at times. Men are naked in the *kashim* and also bathe there.⁹ The *kashim* of Alaska corresponds in some respects to the *estufa* of the southwestern Indians. "In villages untouched by white men the males, when not at work, all congregate in the *kashim* to sleep and while away the time, leaving the native houses in the possession of the women, who carry food to their lords and masters in the *kashim*, but enter at no other times except for certain dances." The location and identity of the *kashim* is not readily revealed, and the entrance is subterranean and somewhat tortuous.¹⁰

The California Indians have the men's house, which "is club-room, council-house, dormitory, sudatory, and medical examination room all in one, and is devoted exclusively to masculine occupation. . . . No squaw may enter on penalty of death except when undergoing her examination for the degree of M.D." There are always enough of these assembly-chambers in each village to furnish sleeping-room for all the adult males. Elsewhere women may enter only on festival days.¹¹ In Colombia the men spend their free time in such club-rooms.¹² The Shingu Indians had their flute-house which no woman might enter and which was used only for feasts, not work; other tribes did all the regular labor in making weapons and utensils, in the men's house. The central point of the existence of the Bororo is the house of the men. Here a noisy, uproarious life is carried on night and day, so that the family huts appear to be only the residence of the women and children. The men, as a united body, with especial reference to the hunting, are called Aroe. In the house of the men there is almost constant singing about topics which excite either joy or sorrow. When they are going on a hunt, instead of sleeping and resting they sing all night. "This tribe makes the impression upon us of a great male chorus of hunters, the members of which bind themselves not to marry before they are forty years old, but to live together in their club houses." The older ones, who have families, possess offices and dignities, and can therefore spend but little time in their houses. In the house of the men, where they were spinning, two would suddenly rise and have a wrestling match. There were always some who were idling, and although women were not generally present, there would be one or two pairs of lovers, to whom the others paid no attention.¹³

The bachelors' house is a conspicuous building where it occurs, and in it live all the young men of the village from the age of puberty until marriage; on a platform before it the young men sit and smoke.¹⁴ In some cases only the small boys sleep in the bachelors' quarters, the older unmarried youths having apparently broken away from them. "The Zawlbuk is a large hall, with a huge hearth in the centre and a sleeping platform at the far end. The front wall stops about three feet short of the ground, and to enter the building you have to stoop under this, and then climb over a barrier of equal height placed a few feet further in. This building is the sleeping place of the young men of the village, and of any strangers who stop there the night. It is also a sort of general meeting house. The boys of the village have to keep up a sufficient supply of firewood for the Zawlbuk fire."¹⁵ The barriers to entrance strikingly resemble those of the Eskimo *kashim*. One tribe requires the young men to sleep apart until a year after marriage. The bachelors' hall is similar to that of the Melanese and the Malays, having the double purpose of guard-house and dormitory for the young men; in front "is a raised platform as a look-out, commanding an extensive view of all approaches, where a Naga is always kept on duty as a sentry," and there is a large hollowed tree-trunk for sounding the alarm or for use on grand occasions. Trophies are kept here, and it is used as a council-hall.¹⁶

The Malay bachelors' barracks generally stand on piles and have the usual purposes above mentioned.¹⁷ The Sea Dyaks ornament their private houses with heads and other trophies, but the Land Dyaks display them in the bachelors' quarters. These buildings are entered by a trap-door in the floor. The head-house is "a circular building attached to most Dyak villages, and serving as a lodging for strangers, the place for trade, the sleeping room of the unmarried youths, and the general council chamber."¹⁸ In Sumatra, from initiation to marriage, "the youths may not any longer sleep in the parental house, except in times of severe illness, but must spend the nights from sunset to sunrise in the village temple. . . . Into this village temple thus there come together every evening all the circumcized but unmarried males out of the village, while there also free lodging is offered to persons who are passing through." If the barracks are not big enough, a part of the bachelors are quartered in a sort of council-house near by. These places are tabooed to females. Where the village government is lax the men's house is the scene of cock-fights and vice.¹⁹ In Ceram a youth puts on at puberty the bark-girdle, is given a place in the joint-house of the bachelors, and must take a head as soon as possible.²⁰

In Formosa the bachelors' house is a sort of temple, ornamented with skulls of enemies and the pig-tails of the Chinese whom they have slain.²¹ In the Loyalty Islands the bachelors' house is occupied by those not betrothed in infancy, or whose wives-to-be have died or been taken from them. They lead a club-life in common, and under polygyny are doomed to celibacy.²² There is a men's assembly-house in Micronesia much on the plan of those described above; they "have nothing to do with religious purposes, for which the mis-

sionaries would have been so glad to use them, but serve only for public affairs and festivities and for the reception and sleeping-accommodation of strangers and bachelors."²³

The unmarried men among the Atharaka, and those whose children are not yet circumcized, cannot sleep in the villages unless they are sick. In each settlement, therefore, the young men build for themselves one hut, generally hidden in a thicket close to the settlement. "Standing in the middle it gives one the impression of a circular saloon with berths all round. These huts are never occupied during the day, and I have never found any signs of habitation, except a fire. . . . The uncircumcized boys also build similar huts. These, however, are smaller and generally much closer to the settlement. The occupants sleep on the ground, there being no bedstead or similar contrivance."²⁴

As among the Zulus, so with the Masai, the warrior is not allowed by the elders to marry until he is about thirty years old, has accumulated some property, or so distinguished himself as to merit an early retirement. He arranges by gifts for girls too young to conceive, whom he takes off to the warriors' village or settlement. "If by chance a girl remains with a warrior and conceives by him, no undue fuss is made, though he may probably have to support his child, and may make up his mind eventually to marry the girl. . . . The young girls who live in the warriors' settlements have as agreeable a time of it as can be provided in Masai society. They are supplied with food; the mothers of the young men do all the cooking, and the girls themselves spend their time in dancing, singing, adorning themselves, and making love. . . . After a woman is married—that is to say, is regularly bought by her husband—she is supposed to remain faithful to him."²⁵ A similar situation is found in Brazil, where a girl is forcibly taken to the men's house, that is, the large festival-house in the center of the village, and painted ornately. She is not married afterwards to any one husband, but all the men of the community occupy the place of father to her children. The whole institution arises from the predominance of the elders, who also receive the gifts that have been given to the girl.²⁶

Not infrequently these houses are found to serve a distinctly educational purpose. In Liberia the girls in such houses learn to sing and dance, to tell tales, cook, attend to all kinds of domestic tasks, and knit nets. The author²⁷ calls the institution an "education-station." Among the Masai "the boys and girls up to a certain age live with their parents. . . . At the age of twelve the girls, and from twelve to fourteen the boys, are sent from the married men's kraal to one in which there are only young unmarried men and women." Peal²⁸ cites this case as a parallel to the *morong* of India; into the latter, as has been noted in another connection, when it is composed of girls only, no married woman may enter. Whether or not the young men and women are segregated in different *morongs*, "there is complete and recognized sexual liberty." The author knows of a single village where there was one girls' *morong*, and none for the young men. The institution of the maidens' sleeping-hall prevails among some Dravidians; "probably too much has been made of the custom in relation to sexual intercourse." In the larger villages of the Gilbert Islands there are men's houses, and "I learned besides of several assembly-houses for women . . . in which the females and the children were occupied, chiefly with weaving

mats; and on the Marshall Islands the young women were shut up nights. In the central Carolines there are special women's houses, especially for females who are in their periods but also for women and children in general.²⁹ Among the Bororo Indians, "as soon as the children have been weaned, which generally does not take place before the fifth or even seventh year, they enter the *Bahito* (men's house) and only occasionally visit their parents. This *Bahito* is a public school where the children are taught spinning, weaving, the manufacture of weapons, and above all singing, upon perfection in which is centred the ambition of all those who wish to become chieftains."³⁰

§163. Initiation-Ceremonies.

Howitt refers in a number of places to the Australian initiation-ceremonies. A knowledge of a great spirit, the sanctioner of social traditions, is given the boys at initiation; no women or children know of him, and his awful name is held secret. "The old men, referring to offenses against propriety and morality, say: 'If you do anything like that when you go back, you will be killed,'—that is, either by magic or direct violence. The things thus forbidden include disrespect towards old men, interference with unprotected women or the wives of other men, 'and those offenses for which, it is said, the Cities of the Plain were destroyed by celestial fire.'" Among the Kurnai the novices, with their blankets drawn closely over their heads, knelt in a row. Then sixteen men emerged, one after the other from the scrub some distance off, each whirling a bull-roarer. When the noise stopped, the novices were required to stand looking upward and the blankets were pulled off. Their gaze was directed from the sky to the performers on the bull-roarer. "Two old men now ran from one novice to the other saying earnestly, 'You must never tell this. You must not tell your mother, nor your sister, nor any one who is not Jeraeil.' The old head man then impressively revealed to the novices the ancestral beliefs." The Kurnai rules of conduct are as follows: "1. To listen to and obey the old men. 2. To share everything they have with their friends. 3. To live peaceably with their friends. 4. Not to interfere with girls or married women. 5. To obey the food restrictions until they are released from them by the old men." Among the Dieri, "in giving notice of the intention to 'make some young men,' the messenger takes a handful of charcoal and places a piece in the mouth of each person present without saying a word. This is fully understood to mean the 'making of young men.'" "In one part of Queensland the sound of the bull-roarer is said to be the noise made by the wizards in swallowing the boys and bringing them up again as young men."

"The community is divided into two exogamic sections, neither of which can by itself initiate its youths. At the age of puberty the boy is taken from his mother and the assembled women by the initiated men—that is, by the local organization. He undergoes certain ceremonies which are partly personal to himself, as circumcision, or the extraction of a tooth, and partly instructive, as by his being taught the ancestral laws which govern the relations of the sexes and the general morality of the tribe. . . . Some parts of the ceremonies are symbolical, as when the youth is invested with the 'belt of manhood,' or where his mother does some act signifying the termination of her maternal

control over him." The taboo on eating covers certain animals that are more nutritious than those permitted, and some that are more plentiful. Thus for a period up to a year he is placed on a sort of fast and thrown on his own resources. When the elders are satisfied with his fitness to rank with the men, he is recalled, and after a further probation is permitted to acquire a wife after the mode approved by the tribe. If he does that before getting the sanction of the local organization, he is put to death. He can now attend the general assembly of men, but may not yet speak during council.²

In another tribe, the young men having suffered the deep horizontal cuts above referred to, "a spray of blood is injected from the arms of several chiefs, on to the man's body, until his whole frame is covered with blood. This blood must not be rubbed off, but must wear off, and he cannot appear, nor can he be seen by women, children, or uncircumcized boys."³ Among the Narrinyeri when the youths' beards have grown a sufficient length they are initiated. They are seized by night and carried off, the women resisting, or pretending to, by pulling at the captives and hurling firebrands. Then the men comb or tear out their matted hair with the point of a spear and pluck out a great part of their moustaches and beards by the roots. For three days and nights the initiates may not eat or sleep, are subjected to many discomforts, and for six months must go naked or nearly so. This condition lasts until their beards have been pulled out three times and each time have grown again to the length of about two inches. Everything they own becomes tabooed to woman's touch. They may not marry until the initiation is over, and any violation of the customs is punished by the old men with death. Again, there is a ceremonial of death and resurrection. The boy is laid on the ground and entirely covered with dust; then, in an almost stifled condition, is raised up by the ears. Later he receives the name which he inherits from father and mother and also a secret name, and is introduced to the rude mysteries. The Australian, while he is a boy, "lives under strict control; his food is regulated by the men, not as to quantity but as to quality. There are various kinds of meat which he must not eat; he cannot enter into any argument in camp; his opinion on any question is never asked, and he never thinks of giving it; he is not expected to engage in fights; and he is not supposed to fall in love with any of the young women. He is, in fact, a nonentity; but when he has gone through the initiatory process of being made a young man, he takes his proper place amongst the members of the tribe. He carries his war implements about with him, and has his share in aboriginal politics. He may now look upon a woman with eyes of love, and, if he be brave enough, seek a wife for himself."⁴

Mathews⁵ somewhat emphasizes the disgusting and obscene phases of Australian initiations, which are, however, not fairly representative of initiations in general and are not reproduced here. The instructions given to the youths "are repeated every evening while the initiation lasts, and really form the principal part of it. The youth is to consider himself responsible for the good of the tribe, its ancient traditions, and its elders."⁶ "There are four social stages for each individual, male or female, to be initiated into, and it may be years before all these ceremonials and corresponding grades are reached and

passed. . . . Before any individual can reach the next higher social stage than that of which he is a member, he must himself pass through all the duties of assisting in the initiating of others into the same rank as himself, until, by reason of his age, he comes to be the leader, chief director, or master of the ceremonies appertaining to his own degree: this coveted distinction having been once attained, he may be admitted into the next rank or degree at the first opportunity which presents itself. Sometimes there will be as many as three or four men accepted into the accorded rank all at the same time. It may be years, even up to old age, before all the social stages are reached."⁷

Of initiation in New South Wales we are told that "among all the tribes of this colony and most of those of others, the knocking out of one or two upper teeth is the sign that it has been performed. When the tooth is knocked out, a loud humming noise is heard. This is made by an instrument of flat wood with serrated edges, having a hole at one end, to which a string is attached." This is the whirr-stick or bull-roarer.⁸ It is stated that the throwing of a boy into the air and catching him is supposed to be beneficial to his growth.⁹ With few exceptions, circumcision is one of the attendant mutilations during the Australian initiation.¹⁰ In Tasmania, the boys were given over to the old women, "who cut them on the thighs, shoulders, and muscles of the breast with stone-cutting implements, and thus raised cicatrices."¹¹

The Australian case is quite complete, and there is a great deal of the same sort of practice in Melanesia. In New Guinea there is a circumcision-festival every ten years; the boys are secluded in the forest for five months, there is a sacred whistle which, like the bull-roarer, is tabooed to the women, and the boys are awakened as if to a resurrection. They are interned in the so-called "Asa-house" and fast for the next month, neither drinking water nor bathing; they must not be seen by a woman's eye. Circumcision was formerly accomplished with an obsidian knife, but later with a splinter of glass. A tremendous feast, for which much food is saved up by all, winds up the ceremony. The boys appear then, wearing each his new girdle of bark and other ornamentation proper to his new condition, and gaily painted. There is a procession, headed and brought up in the rear by drummers.¹² "In England more or less the same thing happens when a girl 'comes out.' She is then supposed to be on a footing with 'grown-ups' and this is practically what happens to the youth of British New Guinea. From the day of his 'coming-out' he occupies his hours in pleasure-seeking and has a good time generally; this goes on for a certain period and then he sallies forth alone into the bush to make his drum. This drum-making is the most serious part of his 'coming-out,' and is conducted with a deal of formality and ceremony which is quaintly mixed with superstition. . . . The making of this musical instrument is an arduous task; it is hewn out from a solid block of wood by means of the crudest instruments, the hollow centre is made by burning it out with cinders of red-hot wood. . . . Many . . . curious superstitions relating to the eating of certain foods are attached to this operation; for instance, . . . if he drinks fresh water it will quench the fire with which he is trying to hollow out his drum, and other things too numerous to mention will happen if equally trifling details are not adhered to; but ; ro-

vided he comes through this important time without any calamities, and completes his drum to his own satisfaction, he steps forth from his seclusion to conquer the heart of a maiden."¹³

Up to ten or twelve years of age, the boys wear no covering of any sort. Then, on an appointed day, a boy is washed, smeared with coconut-oil, endowed with a loin-band, and decorated with all the family jewelry, such as boars' tusks and shells. He may eat no boiled food for ten days, but may stave off starvation by roasting a single banana now and then, eating only the center of it, and throwing away the extremities.¹⁴ At fourteen to sixteen, again, a boy gets bow and arrow, but before getting them he must remain eight to ten days in deep silence. He and an old man, who is his preceptor, if they go abroad, walk with heads down and looking neither to right nor left. Women must get out of their way.¹⁵ Schmidt¹⁶ gives a detailed account, on information derived from a native youth at a Catholic mission, of the secret ceremonies practised at initiation by the Karesau Islanders of the then German New Guinea.

The broad features of initiation in New Guinea appear to be: a complete rupture from the old asexual life of childhood, a clan-rite of integration with the mountain-god, an intermediate stage, the explanation of the bull-roarer, the tribal warrior-festival, and a clan or tribal introduction to the god of the sea. The whole ceremony, which is regarded with absolute terror by the uninitiated, is a sort of schooling as well as a means of attaining social status, for it is on the faithful following-out of the instruction received by initiates that the social and moral welfare of the tribe depends.¹⁷ "Instruction is given to the lads, both of a moral nature and relating to the ordinary occupations of life. The moral code runs something after this fashion:—It is wrong to steal. It is wrong to commit adultery, for if you do you will die quickly. It is wrong to beat your wife; if you do, other people will say you are like a dog. . . . In addition to these instructions given to the boys in the initiation house, the lads were told, 'Now you have seen the Spirit and you are fully a man. To prove yourself you must kill a man,' thus making a murder a social requirement."¹⁸ Among the natives of the Papuan Gulf the boys receive "such information as is calculated to equip them for all the duties and obligations of citizens and worthy members of their tribe. From their guardian they receive all kinds of advice respecting their duty to their tribe; this must always take the first place in all their actions; the enemies of the tribe must be the enemy of the individual initiate; it will be to the best interests of the tribe that it should be so. In selecting a wife, the first thing to be considered is the interests of the tribe, whether she is likely to bear healthy children. . . . Whatever serves the highest interests of the tribe is justifiable. . . . Their conception of right and wrong is governed by what public opinion requires in order that the tribe may maintain its position among other tribes."¹⁹

Codrington²⁰ says that "there is not known in these Islands of Melanesia any initiation or 'making of young men': there is only the entrance into the

various societies;" but Seligmann²¹ mentions a case among the Roro-speaking tribes and another among the southern Massim, while in Fiji there is a ceremony which amounts to the reception of boys at puberty into the assembly of the men. Fison²² describes it in some detail. "Every full-born male is by birth a member of the community, but he is not a *man* until he has been received into the Nanga, and even then he does not attain full membership until he has attended two of its celebrations, one of which is that at which he was initiated." The effect of this regulation is to keep him on probation for two years at least. "There are always a number of youths who are growing to the proper age, and the length of the interval depends upon the decision of the elders." The Nanga is a sacred place where any initiated man may find ancestral spirits for worship, offerings, prayer, or appeals. "Strictly speaking, the Nanga is the Stone Enclosure, but the word seems to be used for the ceremony of initiation also. . . . The heads of the novices are clean shaved and present a curious appearance, owing to the remarkable shapes, the heads being narrowed by lateral pressure during infancy." The climax for the novices is where, "following their leader, the old Vere with the graven staff, their eyes on the ground that they may tread exactly in his footsteps, they go to the Great Nanga as on the former occasions. When they arrive at the Great Nanga they find it deserted. The procession stops, and there is dead silence. Suddenly from the forest a harsh scream of many parrots breaks forth, and then there is a mysterious booming sound. The old Vere now moves slowly forward and leads the young men for the first time into the Nanga tambutambu. Near the outer entrance, his back to the Temple, sits the chief priest regarding them with a fixed stare, and between him and them lie a row of dead men, covered with blood, their bodies apparently cut open and their entrails protruding. The Vere steps over them, one by one, and the youths follow until they stand in a row before the high priest, their 'souls drying up' under his glare. Suddenly he blurts out a great yell, the dead men start to their feet, and run down to the river to cleanse themselves from the blood, etc., with which they are besmeared. These are the Vere with some of the Vunilolo matua, who represent the departed ancestors on the occasion, the blood and entrails being those of many pigs. The parrot screams and other hideous sounds were made by hidden performers, the roaring sound having been made by blowing into a bamboo trumpet, the mouth of which is partly immersed in water." This trumpet is the equivalent of the Australian bull-roarer; to sound it for sport would be impious. The next day the women, with hair dyed a reddish color, and strangely decorated, are allowed to crawl on hands and knees through the Great Nanga into the Nanga tambutambu (tabootaboo). "The chief priest dips his hands in the Sacred Bowl (filled with water) and offers a prayer for the mothers and their children. This is called the *vuluvulu* (hand-washing) of the women, the priest's action being vicarious on their behalf. When the prayer is over, the women return the way they came, crawling over certain earth mounds in the Nanga, which have been prepared for the occasion. As the women retire, they chant a song called the *Ruerue*. When they emerge from the Nanga, the men, hitherto concealed, rush upon them with a yell and an indescribable scene ensues. Accounts differ as to what takes place, but all informants agree that the men and women address each other in the vilest language, using expressions

21 *Melanesians*, 258, 260-261, 495-497.

22 In JAI, XIV, 15, 19, 20, 21 ff., 26; Fro-

benius, *Masken*, 251; Andree, *Eth. Parallelen*, 198.

which would be violently resented on ordinary occasions, and that from the time of the women's coming to the Nanga to the close of the ceremonies very great license prevails."

Circumcision is regarded in Fiji as cleansing and purifying, and "no man can expect to be respected unless he undergoes the operation;"²³ in New Caledonia it came "when the youth's whiskers reached the hair of his head."²⁴ In the New Britain group, "when a number of young men have arrived at the age of 15 or 16 years, a great feast is prepared, to which their relatives are invited. . . . The ceremony over, the young man must go into the bush and hide from his female relatives for from three to six months." If by accident he meets a female relative he gives her something that he happens to have in his possession, and which must then be redeemed by his friends. "This seems to be a sort of compensation of his having met her, it being regarded as an act to his shame . . . and he is supposed to be in disgrace until it is accomplished."²⁵

In the Torres Straits Islands the lads, on arrival at manhood, were taken to the sacred meeting-place for men, located in the bush, and painted all over. They were washed daily and fresh color put on. Each wore a sort of mat-tent over him which completely hid him when sitting, and exposed only the legs when walking. "For a month the boys were kept in their peripatetic prisons, spending all day in silent darkness"; no female may see them and even their fathers might not visit them. Death was the penalty for infringing such regulations. During this period of retirement they were instructed in the customs, morals, and lore of the tribe: "You no steal" was one of the injunctions. The boy must not first propose marriage, but must wait for the lady to ask him. Two mates must not marry each other's sisters, lest they be ashamed by-and-by. "Look after mother and father, never mind if you and your wife have to go without." At the end of the probation the boys were thoroughly cleaned up, oiled all over, decorated, and anointed with "girl medicine," a sort of love-charm. For three months more the boy stayed with his uncle or brother-in-law, not his father. "It seems that the character of various girls was made known to the boys during their initiation, that they might be forewarned."²⁶

The Kaffirs "render an especial attention to the boys at the time of puberty: when this period approaches, neighboring communities join and give over their boys of the same age to an older man who is chosen specially for the office, and they withdraw under his supervision into the wilderness." This mentor circumcises the boys and teaches them the usages, instruction which Fritsch²⁷ calls "academic studies." They stay in seclusion for over six months, then burn their huts, are newly washed and clothed, and return. Those who are initiated together form a kind of brotherhood and in fighting constitute a section of the army under the command of the chief's son who went through the ceremony with them. The boys are schooled in men's duties and are formally whipped, generally by their nearest relations, while kneeling.²⁸ Part of the ceremony is the use of white clay to daub the boys' bodies; they must steal all the meat they get and are punished for clumsiness; there is much violent dancing and running; and the initiates are kept sleepless. Many die under the ordeal. In the end they get the skin cloak, red paint, and arms, and are preached at; they

are told to obey the chief and use their weapons at his command against even their mothers. Much sexual license is permitted.²⁹

The maintenance of circumcision-lodges prevails in many parts of South Africa: in Cape Colony, the Transvaal, Rhodesia, and Bechuanaland. It existed at one time among the Zulus, but was prohibited by Chaka, against the advice of his councillors, at the time he successfully amalgamated the scattered Zulu tribes. These lodges, more commonly called schools, a term probably adopted since the advent among them of missionaries, are convened in some secluded spot where the cold at night is intense. "The cold is calculated, with other hardships, such as whipping and privations, to harden the physique of the young fellows attending, and to make them manly." Native public opinion drives many to submit to the rites. "They are jeered at if they refuse, and are treated to ridicule, such as the following expressions: 'You are a woman,' 'Your eyes are unopened,' and perhaps the still greater taunt, 'You will not please the women, who prefer circumcised men'; and it is generally said at the conclusion of the lodges, that the newly circumcised are greatly favoured by the women." When deaths take place under seclusion, the dead are quietly buried with no mourning; the deceased is looked upon as having simply disappeared; often the mother is not told until the period of seclusion is over.³⁰ While undergoing the rites considerable time is spent in instilling into the youthful mind sound principles for future guidance, the oldest of the chief's councillors usually acting as instructors. The boys are warned against certain wrongs and vicious habits, and encouraged to be faithful and loyal subjects to their chief, and good husbands and fathers. They are shown all the sacred things, or fetishes, of the tribe and made acquainted with their meaning and use, which, however, they are forbidden under heavy penalty to disclose to any outsiders; they are also drilled in the full range of etiquette of intercourse with their superiors and chiefs. "They are taught to be brave in war, cunning in stealing, and true to their special form of heathenism, i.e., to their ancestors. They are taught to bear pain without showing it, and are thus practised in self-restraint." A good part of the instruction given is in the form of proverbs, that is, of long-tested folk-wisdom. "The chief subject used in the proverbs is mankind itself in all its stages. . . . The lessons given are: to be prudent, to be diligent and careful, to avoid evil-doing, to help the needful, to cry with the one who is crying, to honour the last will of the deceased, and so on. Much use is made of proverbs in daily life, and if a stranger cites one or other, the Mowenda gets quite excited and finishes it as soon as he has heard only the beginning."³¹

Brown³² disputes the claim that the circumcision-ceremonies are schools of self-restraint, morality, reverence for elders, and obedience to law. The "initiated man is the prey of the woman, as the woman of the man. This surely disposes of the claim to the teaching of self-restraint. Obedience to law is not taught to the initiated, nor do the songs contain much, if anything, to encourage law-keeping." They announce that "the law has an ending, or comes to an end, if it doesn't it can be left behind. Persistent refusal to abide by the law conquers eventually, and constant breakings of it will wear it out. . . . There

is no teaching of law, none of the righteousness of people, nor any teaching of veneration. There are many teachings that praise wickedness, the honouring of concubinage, and one's uncle and strangers. There is much teaching regarding the cattle, and to steal, but none that holds up law as that by which communities live and prosper. In its place is reverence for antiquity, aversion to change, conformity to traditional custom, and the completeness of Bechuana manhood and womanhood as embodied in the circumcision rites. But there must be no change. As things were in the days of long ago, so they are to-day, so they must remain." This author seems to lack understanding, as well as a command of his own tongue, and to condemn savage ways from some lofty coign of superiority.

The steps toward the gate of manhood are many and difficult among the Bantu. Perhaps the most prominent feature of the initiation-ceremonies after the act of circumcision is the application of the switch. The Bechuana novice is made to lie down with face to the ground and body stretched out, and is then well thrashed, being reminded the while of the faults of his childhood; some who have greatly misbehaved are so severely punished that they die under the chastisement. The ordeal is "to teach them, to develop them, to ensure that there shall be no rebelling against the ancient ways, or walking in strange paths. In short, it is to bring them to the full heritage of their birthright."³³ The headman of the village tells the Bageshu boys about their customs, history, marriage-usages, and impresses upon them the necessity of being brave to fight the battles for the tribe. In some cases, "youths shrink from the operation [of circumcision] and go on from year to year postponing it. They may find some women who agree to become their wives and they may have families, but they can never claim to be full members of the clan, nor may they wear the dress peculiar to those who are full members."³⁴

Circumcision is a regular ceremony among most of the tribes of Central and East Africa, and in some cases is the only one of importance; no reason, however, is assigned for the custom and its origin is unknown. With hardly an exception, no uncircumcized man or woman might marry. There are certain natural grades, if they may be so termed, through which a native can expect to pass during his life; these compose a system of graduated initiation commencing when a child is circumcized; after the stages of the circumcision-rites are finished he becomes a full-fledged warrior; a little later a young married man; and when he has circumcized children he enters upon the various grades of the council. The initiation-ceremonies may well be regarded as the opening chapter in the tribal life of the individual, a life every event of which is marked by the performance of some rite. At the present time, among some of these tribes, there is a tendency for the rites to be performed at an earlier and earlier age so that the youths may benefit by the instruction given at the ceremonies before they come under missionary influence and lose the ties of tribal custom. One of the chief features of the initiation-ceremonies is the teaching of morals, of what in the native's mind constitutes right and wrong; bravery, justice, keeping one's wife in subjection, respect for riches, and good manners in the presence of superiors are some of the matters emphasized. One authority on these tribes, having in mind the rites symbolical of the entrance upon a

new era in the life of the candidates, thinks that "the confirmation ceremony of the Christian church is in all probability an adopted relic of the initiation ceremonies handed down from ancient times."³⁵

The stages of development to full manhood, among the Nigerian head-hunters, seem to be (a) circumcision, (b) initiation, (c) scarification, (d) the taking of a head if possible, (e) marriage, and (f) the shaving of the head.³⁶ In West Africa, "the boy, if he belongs to a tribe that goes in for tattooing, is tattooed, and is handed over to instructors in the societies' secrets and formulae. He lives, with the other boys of his tribe undergoing initiation, usually under the rule of several instructors, and for the space of one year. He lives always in the forest, and is naked and smeared with clay. The boys are exercised so as to become inured to hardship; in some districts they make raids so as to perfect themselves in this useful accomplishment. They always take a new name, and are supposed by the initiation process to become new beings in the magic wood, and on their return to their village at the end of their course, they pretend to have entirely forgotten their life before they entered the wood; but this pretence is not kept up beyond the period of festivities given to welcome them home. They all learn, to a certain extent, a new language, a secret language only understood by the initiated."³⁷ In West Africa a boy must die to the mother-tribe and be born again to the father-tribe; the rite at puberty symbolizes this.³⁸ Frobenius³⁹ refers to initiation, chiefly in connection with the secret societies; only a limited number go through it, he says, at least through all grades. The medicine-man takes them into the forest and gives them a dose that robs them of consciousness. Circumcision takes place at this time. "They allow the young men 'for the alleviation of their pains' during this time to rob a hen-house or to steal an ox from a poor Fulbe herder, in order to keep themselves in spirits. The laws would at another occasion strictly take notice of this deed." But no murdering may be done. It is a great crime to have sexual relations before circumcision. The injunctions given to the initiates are enforced with heavy whips plied by men in fearful masks. In Senegambia much plundering and other violence is done under cover of the masks, which indicate membership among the politically mature men.⁴⁰ In other places young men test each other's endurance by duels with hippopotamus-hide whips, suffering severely, but with no whimpering.⁴¹ Sacrifices and markings with blood and fat, together with feasts, are Northeast African puberty-ceremonies accompanying the circumcision.⁴² In the course of numerous travels, Trilles⁴³ never saw a Fan who was not circumcised, and asserts that circumcision has been observed over the whole world, in the most diverse races, generally being part of the ceremonies of initiation, "which unite most intimately the young man to his tribe, to his god or gods." He agrees with those authors who regard the practice as, in origin, never hygienic but essentially religious. After mentioning cases of circumcision in the Sudan, Seligmann⁴⁴ cites from Strabo, who

wrote two thousand years ago, certain historical evidence as to its antiquity. He says the practice is widespread among the Arabs and in Syria, is absent in North Africa among the Berbers, though the Tuaregs are said to circumcise, and is found in the French Sudan, in Sierra Leone, Benin, Akra, Old Calabar, and Loango. It was not originally Mohammedan or Arabic.

In ancient India there was a beard-ceremony for a youth of sixteen to eighteen, shortly before his marriage. In later times the ten- or twelve-year-old boy is simply invested with a garland of shells.⁴⁵ Among certain Tibetans the boy of fifteen is initiated by torture under the eyes of the chiefs and lamas. If he shows pain he is abused and scorned until he commits suicide; if not, he is subjected to the hunger-ordeal. Those who come through are given weapons and must prove their prowess as hunters and warriors.⁴⁶ The Chinese youth was "capped," that is, ceremoniously presented with three caps, when he was twenty.⁴⁷

In Borneo, "the women often prove the courage and endurance of the youngsters by placing a lighted ball of tinder on the arm, and letting it burn into the skin. The marks thus produced run along the forearm from the wrist in a straight line, and are much valued by the young men as so many proofs of their power of endurance."⁴⁸ Among the Alfurs of Buru circumcision is performed on boys and girls of eight to ten years, but Wilken⁴⁹ says it has no religious character and is accompanied by no usages. Tattoo in the Society Islands was probably a mark of puberty,⁵⁰ while in Samoa until a young man was tattooed he was considered in his minority; "he could not think of marriage, and he was constantly exposed to taunts and ridicule, as being poor and of low birth, and as having no right to speak in the society of men. But as soon as he was tattooed he passed into his majority, and considered himself entitled to the respect and privileges of mature years. When a youth, therefore, reached the age of sixteen, he and his friends were all anxiety that he should be tattooed."⁵¹ In the Gilbert Islands, "from the moment of weaning, a boy was regarded as a potential warrior, and from first to last the ceremonies which he underwent were performed with that idea predominating." At five he was taken by his father and, after being washed with fresh water in a bowl of wood as a sign that his infancy was done, he was set apart from his mother and sisters, forbidden the fellowship of all girls of his age, and obliged to sleep thereafter only beside boys and men. At eight his diet began to be strictly regulated, and when about twenty or twenty-five he was put through a series of trying ordeals, all of which had to be borne without a murmur.⁵² In the initiation of the eldest son of the Maori head-chief, "the young chief is urged to sleep, and the priest watches for omens. . . . If an arm or a leg jerk inwards it indicates luck, but if it jerk outwards, the lad cannot be taught." But there are no special puberty-ceremonies except in the case of this one youth, who has to know the secrets of priestcraft and witchcraft.⁵³

There are comparatively few cases of thoroughgoing initiation, thus far, outside of the black races; but when we come to America we find another classic

ground for the custom. Even in Greenland there are exchanges of blows to test endurance; "one beat the other with all his might unceasingly on the back, whereby the loser was he who first got tired either of giving or receiving the blows."⁵⁴ "Husquenawing" was "an ordeal to which certain promising young Virginia Indians were submitted, upon reaching the age of virility, as an initiation into a new state of life, that of manhood, and for the purpose of rendering them oblivious to every event of the preceding state of adolescence, and of preparing their mind for the reception of new impressions." They went into the woods under a custodian and were dosed with medicines that made them delirious; thereafter they were supposed to forget that they had ever been boys. "Huskanawed" is a local expression used of a person who looks as if he had been subjected to the action of an emetic. The initiates were supposed to have a "new body."⁵⁵

According to Donaldson's⁵⁶ account, the Mandan initiation was held at the rallying-point of the whole nation, a religious center called the "big canoe," at a time indicated by the full expansion of the willow leaves. Then appears from the distance the "first or only man," impressively painted with white clay and carrying a large pipe, and enters the medicine-lodge. "During the first night of this strange character in the village, no one could tell where he slept; and every person, both old and young, and dogs, and all living things, were kept within doors, and dead silence reigned everywhere." The next day about fifty young men appeared as candidates. They were addressed in the medicine-lodge by the "first man" and an old medicine-man was appointed master of ceremonies; then the former marched away, after promising to return the next year. Thereafter for four days and nights the young men were watched by the medicine-man, who lay by the fire, with the medicine-pipe, crying to the Great Spirit, and were not allowed to eat, drink, or sleep. Catlin was allowed to enter the lodge because he had painted a full-length of the medicine-man which had so astonished him that he credited the artist with high skill in magic and mysteries. Various articles of extreme sanctity whose nature and use "could not be told" appeared in the lodge; liberal offers to buy them were firmly refused. Among them were four sacks of water which "had been contained therein ever since the settling down of the waters!"

Outside there occurred during these four days the buffalo-dance, or bull-dance, which was necessary in order that they might have bison-meat during the season. Then the evil spirit, personated by a man painted coal-black came rushing in from the distance and was held still and immovable by being confronted with the medicine pipe—a fetish competent to check and disarm him. It is noticeable that this spirit had turned his attention chiefly to the women, who had fled in terror before him. All applauded his defeat at the hand of the medicine-man, "and all eyes gazed upon him; of chiefs and of warriors, matrons, and even of their tender-aged and timid daughters, whose education had taught them to receive the moral of these scenes without the shock of impropriety that would have startled a more fastidious and consequently sensual-thinking people." Finally the evil spirit was teased and tantalized by the women, and was at length driven from the village with sticks and stones, to the deep satisfaction of all. He had come to disturb their worship. Since he had been ejected, they could turn to the chief task of the time: the initiation.

⁵⁴ Fries, *Grönland*, 116, note.

⁵⁵ Gerard, in AA, IX, 93-94.

⁵⁶ In *Smithson. Rep.*, 1885, pt. II, 352 ff.; Matthews, in USNM, 1890, 606 ff.

The inside of the medicine-lodge came now to present a sort of shambles, for the "cutting scene" was next staged. It is described, after Catlin's sketch and in awkward English, as follows. "Around the sides of the lodge are seen, still reclining, . . . a part of the group, whilst others of them have passed the ordeal of self-tortures, and have been removed out of the lodge; and others still are seen in the very act of submitting to them, which were inflicted in the following manner: After having removed the *sanctissimus sanctorum*, or little scaffold, of which I before spoke, and having removed also the buffalo and human skulls from the floor, and attached them to the posts of the lodge, and two men having taken their positions near the middle of the lodge, for the purpose of inflicting the tortures, the one with the scalping-knife, and the other with the bunch of splits [splints] . . . in his hand, one at a time of the young fellows, already emaciated with fasting and thirsting and waking for nearly four days and nights, advanced from the side of the lodge and placed himself on his hands and feet, or otherwise, as best suited for the performance of the operation, where he submitted to the cruelties in the following manner: An inch or more of the flesh on each shoulder or each breast was taken up between the thumb and finger by the man who held the knife in his right hand, and the knife, which had been ground sharp on both edges, and then hacked and notched with the blade of another, to make it produce as much pain as possible, was forced through the flesh below the fingers, and being withdrawn, was followed with a splint or skewer from the other, who held a bunch of such in his left hand, and was ready to force them through the wound.

"There were then two cords lowered down from the top of the lodge (by men who were placed on the lodge outside for the purpose), which were fastened to these splints or skewers, and they instantly began to haul him up; he was thus raised until his body was suspended from the ground, where he rested until the knife and a splint were passed through the flesh or integuments in a similar manner on each arm below the shoulder (over the *brachialis externus*), below the elbow (over the *extensor carpi radialis*), on the thighs (over the *vastus externus*), and below the knees (over the *peroneus*).

"In some instances they remained in a reclining position on the ground until this painful operation is finished, which was performed in all instances exactly on the same parts of the body and limbs, and which in its progress occupied some five or six minutes.

"Each one was then instantly raised with the cords until the weight of his body was suspended by them, and then, while the blood was streaming down their limbs, the bystanders hung upon the splints each man's appropriate shield, bow and quiver, &c.; and in many instances the skull of a buffalo, with the horns on it, was attached to each lower arm and each lower leg, for the purpose probably of preventing by their great weight the struggling which might otherwise have taken place to their disadvantage whilst they were hung up.

"When these things were all adjusted each one was raised higher by the cords, until those weights all swung clear from the ground, leaving his feet, in most cases, some 6 or 8 feet above the ground. In this plight they at once became appalling and frightful to look at—the flesh to support the weight of their bodies, with the additional weights which were attached to them, was raised 7 or 8 inches by the skewers, and their heads sunk forward on the breasts,

or thrown backwards, in a much more frightful condition, according to the way in which they were hung up.

"The unflinching fortitude with which every one of them bore this part of the torture surpassed credulity; each one, as the knife was passed through his flesh, sustained an unchangeable countenance; and several of them, seeing me making sketches, beckoned me to look at their faces, which I watched all through this horrid operation without being able to detect anything but the pleasantest smiles as they looked me in the eye, while I could hear the knife rip through the flesh and feel enough of it myself to start involuntary and uncontrollable tears over my cheeks.

"When raised to the condition above described, and completely suspended by the cords, the sanguinary hands through which he had just passed turned back to perform a similar operation on another who was ready, and each one in his turn passed into the charge of others, who instantly introduced him to a new and improved stage of their refinements in cruelty.

"Surrounded by imps and demons as they appear—a dozen or more—who seem to be concerting and devising means for his exquisite agony, gather around him, when one of the number advances toward him in a sneering manner and commences turning him around with a pole which he brings in his hand for the purpose. This is done in a gentle manner at first, but gradually increased, when the brave fellow, whose proud spirit can control its agony no longer, burst out in the most lamentable and heartrending cries that the human voice is capable of producing, crying forth a prayer to the Great Spirit to support and protect him in this dreadful trial, and continually repeating his confidence in his protection. In this condition he is continued to be turned faster and faster, and there is no hope of escape from it, nor chance for the slightest relief, until by fainting his voice falters and his struggling ceases, and he hangs apparently a still and lifeless corpse. When he is by turning gradually brought to this condition, which is generally done within ten or fifteen minutes, there is a close scrutiny passed upon him among his tormentors, who are checking and holding each other back as long as the least struggling or tremor can be discovered, lest he should be removed before he is (as they term it) 'entirely dead.'

"When brought to this alarming and most frightful condition, and the turning has gradually ceased, as his voice and his strength have given out, leaving him to hang entirely still and apparently lifeless, when his tongue is distended from his mouth, and his medicine-bag, which he has affectionately and superstitiously clung to with his left hand, has dropped to the ground, the signal is given to the men on top of the lodge by gently striking the cord with the pole below, when they very gradually and carefully lower him to the ground.

"In this helpless condition he lies like a loathsome corpse to look at, though in the keeping (as they call it) of the Great Spirit, whom he trusts will protect him and enable him to get up and walk away. As soon as he is lowered to the ground thus, one of the bystanders advances and pulls out the two splints or pins from the breasts and shoulders, thereby disengaging him from the cords by which he has been hung up, but leaving all the others with their weights, &c., hanging to his flesh.

"In this condition he lies for six or eight minutes, until he gets strength to rise and move himself, for no one is allowed to assist or offer him aid, as he is here enjoying the most valued privilege which a Mandan can boast of, that of 'trusting his life to the keeping of the Great Spirit' in this time of extreme peril.

"As soon as he is seen to get strength enough to rise on his hands and feet and drag his body around the lodge, he crawls, with the weights still hanging to his body, to another part of the lodge, where there is another Indian sitting with a hatchet in his hand and a dried buffalo skull before him; and here, in the most earnest and humble manner, by holding up the little finger of his left hand to the Great Spirit, he expresses to him in a speech of a few words his willingness to give it as a sacrifice, when he lays it on the dried buffalo skull, when the other chops it off near the hand with a blow of the hatchet.

"Nearly all of the young men whom I saw passing this horrid ordeal gave, in the above manner, the little finger of the left hand; and I saw also several who immediately afterwards (and apparently with very little concern or emotion), with a similar speech, extended in the same way the forefinger of the same hand, and that, too, was struck off, leaving on the hand only the two middle fingers and the thumb, all which they deem absolutely essential for holding the bow, the only weapon for the left hand.

"One would think that this mutilation had thus been carried quite far enough; but I have since examined several of the head chiefs and dignitaries of the tribe, who have also given, in this manner, the little finger of the right hand, which is considered by them to be a much greater sacrifice than both of the others; and I have found also a number of their most famous men, who furnish me incontestable proof, by five or six corresponding scars on each arm, and each breast, and each leg, that they had so many times in their lives submitted to this almost incredible operation, which seems to be optional with them; and the oftener they volunteer to go through it the more famous they become in the estimation of their tribe.

"No bandages are applied to the fingers which have been amputated; no arteries taken up; nor is any attention whatever paid to them or the other wounds; but they are left (as they say) 'for the Great Spirit to cure, who will surely take good care of them.' It is a remarkable fact, which I learned from a close inspection of their wounds from day to day, that the bleeding is but very slight and soon ceases, probably from the fact of their extreme exhaustion and debility, caused by want of sustenance and sleep, which checks the natural circulation, and admirably at the same time prepares them to meet the severity of these tortures without the same degree of sensibility and pain which, under other circumstances, might result in inflammation and death.

"During the whole of the time of this cruel part of these most extraordinary inflictions the chiefs and dignitaries of the tribe are looking on, to decide who are the hardest and stoutest hearted—who can hang the longest by his flesh before he faints, and who will be soonest up, after he has been down—that they may know whom to appoint to lead a war party, or place at the most honorable and desperate post. The four old men are incessantly beating upon the sacks of water and singing the whole time, with their voices strained to the highest key, vaunting forth, for the encouragement of the young men, the power and efficacy of the medicine-pipe, which has disarmed the monster *O-kee-hee-de* (or Evil Spirit), and driven him from the village, and will be sure to protect them and watch over them through their present severe trial.

"As soon as six or eight had passed the ordeal as above described, they were led out of the lodge, with their weights hanging to their flesh, and dragging on the ground, to undergo another and a still more appalling mode of suffering, in the center of the village, and in presence of the whole nation, in the manner as follows:

"The signal for the commencement of this part of the cruelties was given by the old master of ceremonies, who again ran out as in the buffalo-dance, and leaning against the big canoe with his medicine-pipe in his hand began to cry. This was done several times in the afternoon, as often as there were six or eight who had passed the ordeal just described within the lodge, who were then taken out in the open area, in the presence of the whole village, with the buffalo skulls and other weights attached to their flesh and dragging on the ground. There were then in readiness and prepared for the purpose about twenty young men, selected of equal height and equal age, with their bodies chiefly naked, with beautiful (and similar) head-dresses of war eagles' quills on their heads, and a wreath made of willow boughs held in the hands between them, connecting them in a chain or circle, in which they ran around the big canoe with all possible speed, raising their voices in screams and yelps to the highest pitch that was possible, and keeping the curb or big canoe in the center as their nucleus. . . .

"Then were led forward the young men who were further to suffer, and being placed at equal distances apart and outside of the ring just described, each one was taken in charge by two athletic young men, fresh and strong, who stepped up to him, one on each side, and by wrapping a broad leather around his wrists without tying it, grasped it firm underneath the hand and stood prepared for what they call Eh-ke-nah-ka-nah-pick, the last race.

"This the spectator looking on would suppose was most correctly named, for he would think it was the last race they could possibly run in this world. In this condition they stand pale and ghastly from abstinence and loss of blood, until all are prepared and the word is given, when all start and run around outside of the other ring, and each poor fellow, with his weights dragging on the ground, and his furious conductors by his side, who hurry him forward by the wrists, struggles in the desperate emulation to run longer without 'dying' (as they call it) than his comrades, who are fainting around him and sinking down, like himself, where their bodies are dragged with all possible speed, and often with their faces in the dirt. In the commencement of this dance or race they all start at a moderate pace, and their speed being gradually increased, the pain becomes so excruciating that their languid and exhausted frames give out, and they are dragged by their wrists until they are disengaged from the weights that were attached to their flesh, and this must be done by such violent force as to tear the flesh out with the splint, which (as they say) can never be pulled out endwise without greatly offending the Great Spirit and defeating the object for which they have thus far suffered. The splints or skewers which are put through the breast and the shoulders, take up a part of the pectoral or trapezius muscle, which is necessary for the support of the great weight of their bodies, and which, as I have before mentioned, are withdrawn as soon as he is lowered down; but all the others, on the legs and arms, seem to be very ingeniously passed through the flesh and integuments without taking up the muscle, and even these, to be broken out, require so strong and so violent a force that most of the poor fellows fainted under the operation, and when they were freed from the last of the buffalo skulls and other weights (which was often done by some of the bystanders throwing the weight of their bodies on to them as they were dragging on the ground) they were in every instance dropped by the persons who dragged them, and their bodies were left, appearing like nothing but a mangled and a loathsome corpse. At this strange and frightful juncture the two men who had dragged them fled

through the crowd and away upon the prairie, as if they were guilty of some enormous crime and were fleeing from summary vengeance.

"Each poor fellow having thus patiently and manfully endured the privations and tortures devised for him, and (in this last struggle with the most appalling effort) torn himself loose from them and his tormentors, he lies the second time in the 'keeping (as he terms it) of the Great Spirit,' to whom he issues his repeated prayers and intrusts his life, and in whom he reposes the most implicit confidence for his preservation and recovery. As an evidence of this, and of the high value which these youths set upon this privilege, there is no person, not a relation or a chief of the tribe, who is allowed, or who would dare to step forward to offer an aiding hand, even to save his life; for not only the rigid customs of the nation, and the pride of the individual who has intrusted his life to the keeping of the Great Spirit, would sternly reject such a tender; but their superstition, which is the strongest of all arguments in an Indian community, would alone hold all the tribe in fear and dread of interfering, when they consider they have so good a reason to believe that the Great Spirit has undertaken the special care and protection of his devoted worshippers.

"In this 'last race,' which was the struggle that finally closed their sufferings, each one was dragged until he fainted, and was thus left, looking more like the dead than the living; and thus each one laid, until, by the aid of the Great Spirit, he was in a few minutes seen gradually rising, and at last reeling and staggering like a drunken man through the crowd (which made way for him) to his wigwam, where his friends and relatives stood ready to take him into hand and restore him.

"In this frightful scene, as in the buffalo-dance, the whole nation was assembled as spectators, and all raised the most piercing and violent yells and screams they could possibly produce to drown the cries of the suffering ones, that no heart could even be touched with sympathy for them. I have mentioned before that six or eight of the young men were brought from the medicine-lodge at a time, and when they were thus passed through this shocking ordeal, the medicine-men and the chiefs returned to the interior, where as many more were soon prepared and underwent a similar treatment, and after that another batch and another, and so on until the whole number, some forty-five or fifty, had run in this sickening circle, and, by leaving their weights, had opened the flesh for honorable scars. I said 'all,' but there was one poor fellow though (and I shudder to tell it), who was dragged around and around the circle with the skull of an elk hanging to the flesh of one of his legs; several had jumped upon it, but to no effect, for the splint was under the sinew, which could not be broken. The dragging became every instant more and more furious, and the apprehensions for the poor fellow's life apparent by the piteous howl which was set up for him by the multitude around, and at last the medicine-man ran, with his medicine-pipe in his hand, and held them in check, when the body was dropped and left upon the ground with the skull yet hanging to it. The boy, who was an extremely interesting and fine-looking youth, soon recovered his senses and his strength, looking deliberately at his torn and bleeding limbs, and also with the most pleasant smile of defiance upon the misfortune which had now fallen to his peculiar lot, crawled through the crowd (instead of walking, which they are never again at liberty to do until the flesh is torn out and the article left) to the prairie, and over which, for the distance of half a

mile, to a sequestered spot, without any attendant, where he laid three days and three nights, yet longer, without food, and praying to the Great Spirit, until suppuration took place in the wound, and by the decaying of the flesh the weight was dropped, and the splint also, which he dare not extricate in another way. At the end of this he crawled back to the village on his hands and knees, being too much emaciated to walk, and begged for something to eat, which was at once given him, and he was soon restored to health.

"These extreme and difficult cases often occur, and I learn that in such instances the youth has it at his option to get rid of the weight that is left upon him in such way as he may choose, and some of those modes are far more extraordinary than the one which I have just named. Several of the traders, who have been for a number of years in the habit of seeing this part of the ceremony, have told me that two years since, when they were looking on, there was one whose flesh on the arms was so strong that the weights could not be left, and he dragged them with his body to the river by the side of the village, where he set a stake fast in the ground on the top of the bank, and fastening cords to it, he let himself half-way down a perpendicular wall of rock of twenty-five or thirty feet, where the weight of his body was suspended by the two cords attached to the flesh of his arms. In this awful condition he hung for several days, equidistant from the top of the rock and the deep water below, into which he at last dropped and saved himself by swimming ashore!"

Other initiation ceremonies, even among the Indians, seem to pale into comparative child's-play beside the foregoing. It must be understood that such thoroughgoing torture represents an extreme, and the vividness of this case should not be allowed unduly to color the impression of initiation-ceremonies as they occur about the world. Among other of the Siouans there is purification by fasting and the steam-bath, and finally armor is presented to the candidate. At that time the youth is told of some animal which must remain tabooed to him until he has slain numerous enemies, or for life.⁵⁷ At the age of seventeen or eighteen the young Comanche makes his first weapons, the shield from the hide of an old bison-bull killed with arrows, never with a gun.⁵⁸ The making of the labret perhaps took its rise "in the early custom of submitting the boy at puberty to a trial of his resolution and manly endurance, previous to his admission as a member of the community. . . . Tattooing is primarily a test of fortitude, besides, by its fashion, indelibly indicating the individual's particular commune in which his rights might be exercised."⁵⁹ In southern Alaska, when the nose and ears are pierced, there is a potlatch and a new name is given; similarly when the young are tattooed.⁶⁰ Throughout the eastern and central region of the United States the boy, when about fifteen years of age, made solitary fast and vigil to obtain communication with the medicine-spirit which was to be his protector through life; then, after the initiatory ordeal to which, in some tribes, he was subjected, the youth was competent to take his place as a man among the warriors.⁶¹ Among the Zuñi "every male child must receive involuntary initiation at the age of four or five years and voluntary initiation at ten or twelve years into the society of the Kok-ko, in order to be admitted after death into the Great Dance-house."

One of their non-kinship relations, described in terms of father and child, is that between the initiate and him who initiates.⁶²

Among the tribes of northern South America the boys must bear wounds on breast and arms without betraying their pain before they can join the ranks of the men. If they cannot do so, they receive tests later on.⁶³ Elsewhere both boys and girls are subjected by the medicine-man to the bites of infuriated ants; if they cry out they are not admitted to the feasts of the elders. Scourging each other to show heroism and as an act of love is practised by both sexes. Circumcision of boys at the age of nine, followed by a month of solitude in the forest, is found; they get a new plant or animal name on the occasion, and a boy's mother becomes a stranger to him after initiation. He must also show that he can draw the bow, and then he may marry.⁶⁴ When the Jibaro boy reaches the age of puberty and is to be received among the full-grown men, he is obliged among other things to take a narcotic drink which has the power of awakening within him peculiar visions and hallucinations; these are ascribed to certain spirits, "the old ones." Only the youth who has seen these spirits in the dream and has been spoken to by them can expect to become a valiant and successful warrior, to kill many enemies, and to secure long life.⁶⁵

In Peru, there was "a festival intended to signalize the arrival of young men at manhood, in which there was a sort of communion consisting of bread kneaded by the young virgins of the sun with the blood of victims. The same communion was noted at another festival occurring during September of each year."⁶⁶ The sons of the Incas were not confirmed as such until tested and their ears bored. Ear-rings were the sign of the Inca tie.⁶⁷ Among the Fuegians, "when boys and girls come to the years of virility they undergo a kind of discipline and teaching, which generally begins in the spring. This is done to make them quiet and good. The discipline of the girl is easy and brief, conducted in the common wigwam by her parents. She has to abstain from certain kinds of food, and has to behave herself very quietly, and to listen very attentively to the injunctions of her parents. After this she is shortly given in marriage. . . . The lads of about thirteen years of age are considered fit for this discipline. They are taken by their fathers away from their mothers and sisters, to a wigwam set apart for superstitious practices, which is out of sight of the dwelling wigwams. It is called Ceena. Here the lads are made to work hard in gathering fuel, they are kept on short allowance, when they go out to do anything some one is sent to watch them. They are dealt with very strictly, and this is done to make them obedient and docile. They are also here initiated into the superstitions of their sires, which they are strictly charged not to divulge to any female. They here see the cheats imposed on the young children and women . . . and they have to make themselves bloody with their own blood. They are also taught by their fathers not to steal, not be quick to take offence, not to be too much given to jealousy, to marry not young women who would desert them, and cannot take good care of their canoes, and supply them well with fish, etc., but to marry oldish women, who will be steady

and are well accustomed to all their duties. The lads often become very thin during this discipline, which lasts for several years, after which they are allowed to marry, and are then considered men. During the time the father and son is at Ceena, which is from a few days to about two weeks, neither father nor son sees any female; food is sent them by the women, through some man or other, daily. The ceremonies here conducted are to impose upon the women, to effect which the men make large conical masks of bark which completely cover the head; they also paint their bodies peculiarly, and when all is ready they rush out of the Ceena, and dance and jump about as nimbly as they can in view of the women, who look upon them as beings from another world. But sometimes when they are dancing the mask falls off through their tumbling down, and then the women laugh tremendously in derision."⁶⁸

There are a number of cases of initiation-ceremonies, usually at puberty, for girls. Where circumcision is a regular tribal practice it is not uncommon for the girls as well as the boys to be subjected to it. In South Africa the girls, before being taken into the tribe as marriageable, must "undergo a strict instruction in their future duties which is conducted just as secretly as that of the boys and lasts several weeks." They too are toughened by being deprived of sleep.⁶⁹ The time of the ceremony is one of license for women and of considerable irregularity in the mores.⁷⁰ The girls are not sent to the circumcision-lodge or school, but receive their schooling from some old woman of rank on the banks of a river. "They are driven into deep water and kept there during the pleasure of the instructress, however cold it may be, till everything is done according to their particular rites."⁷¹ In West Africa, along with the initiation of the boys, "the same removal from home and instruction from initiated members is also observed with the girls. However, in their case, it is not always a forest grove they are secluded in, sometimes it is done in huts." Again, "the girls go into a magic wood until they are married. Should they have to leave the wood for any temporary reason, they must smear themselves with white clay. A similar custom holds good in Okyon, Calabar district, where, should a girl have to leave the fattening-house, she must be covered with white clay. I believe this fattening-house custom in Calabar is not only for fattening up the women to improve their appearance, but an initiatory custom as well, although the main intention is now, undoubtedly, fattening, and the girl is constantly fed with fat-producing foods."⁷² The Togo girl, arriving at maturity, has her head covered and is baptized thrice upon the head, as a sign that all uncleanness has left her. She goes about later in a condition of highly decorated undress, visiting all the people and thanking them.⁷³

Among the Nairs "social puberty differs considerably in point of time from physiological puberty. It is a matter of great importance that the former should precede the latter. Any family in which a girl attains her physiological puberty . . . before she had attained her social puberty, is socially outside the pale."⁷⁴ In the Shan states a girl is not allowed to don the skirt without going through certain ceremonies, consisting in part of submitting to being

pinched.⁷⁵ In Samoa there are prayers for the girl's health and happiness at the time of puberty.⁷⁶

Numerous ceremonies must be observed when girls among the Tsimshian and Kwakiutl reach maturity. "When about thirteen or fourteen years old, they begin to practice fasting, eating in the afternoon only, as a very severe fasting is prescribed at the time when they reach maturity. It is believed that if they have any food in their stomachs at this time, they will have bad luck in all the future. They must remain alone and unseen in their room or in a hut for ten days, and abstain from food and drink." If a girl desires a certain number of sons when married, the same number of men chew her food for her; if she desires daughters, that office is performed by women. At the end of the fast she is covered with mats and held over a fire in order that her children may be healthy.⁷⁷ Among the Salish tribes the period of the seclusion of a girl upon reaching the age of puberty was a month and a half. She was under certain taboos or restrictions in the matter of food. "These restrictions had a twofold purpose. First, to prevent her from becoming a greedy and sensual woman, and second, because of the 'bad medicine' or the malign influence she was supposed to exercise at this time upon animals by reason of her condition. A menstruating woman was a thing of abhorrence in the eyes of the Indian, and imparted misfortune and ill-luck to the opposite sex in many ways." The occasion of seclusion was taken advantage of by the elders to instruct girls in the several duties and responsibilities of womanhood. To teach them industrious habits, the girls were employed in plucking the needles from a fir branch one at a time, in picking yarn, and in spinning.⁷⁸ A Cheyenne girl was forced to sit up for long periods to prevent her from becoming lazy, and among the Haida she had to sleep on a flat rock with a bag of gravel or something similar for a pillow. If she ate too much, it was thought that she would be greedy in later life; if she talked too much, that she would become garrulous; if she laughed, that she would become too much inclined to hilarity. A Shuswap girl would climb trees and break off their tips in order to become strong, and play with gambling sticks that her future husband might be a successful gamester; a Hupa girl must not tell a lie during this time or she would become forever untruthful; elsewhere, she was laid upon green herbs caused to steam by means of a fire underneath, thereafter covered with blankets and left for four days and nights, while dancing and feasting went on about her to drive away the evil spirits. While this "roasting of the girls" ceremony is being performed, symbolic acts take place, such as throwing seeds over them that they might be prolific, and scattering property among the onlookers that they might be generous.⁷⁹ One of the Apache communities had a custom, when a girl arrived at puberty, of having the other young girls lightly tread on her back as she lay face downward, the ceremony being followed by a dance, while in another tribe the girl goes about a mile from home, where she lives in isolation for a year under the care of a relative of her betrothed; during this period fresh meat is tabooed, for otherwise game would become scarce during the ensuing year.⁸⁰

In one California tribe "the puberty dance is celebrated as follows: For nine

days the male relatives of the girl dance all night, but her female relatives do not join in the dancing, only in the singing. The girl eats no meat, and remains apart and blindfolded all this time. During the tenth night she is in the house, but keeps close in a corner. The finishing stroke of the ceremony is participated in by two old women and two young men, her relatives, the young men having around their heads leather bands thickly set with sea-lion's teeth—a ferocious looking head-dress consecrated especially to this ceremony. These five persons are in a row, the girl in the center, the two young men standing on either side of her and the two old women squatting on the outside. The girl goes forward a few steps and then backward. She does this ten times, chanting and throwing her hands up to her shoulders. The last time she runs forward and gives a leap; then the ceremony is ended." A second ceremony is thus described: "First, as a preparation for this festivity, the maiden is compelled to abstain rigidly from animal food for three days, and to allowance herself on acorn porridge. During this time she is banished from camp, living alone in a distant booth, and it is death to any person to touch or even to approach her. At the expiration of the three days she partakes of a sacred broth or porridge, called *khlu*, prepared as follows from buckeyes: the buckeyes are roasted underground a considerable time to extract the poison, then boiled to a pulp in small sand-pools with hot stones. The eating of this prepares her for subsequent participation in the dance, and consecrates her to the duties of womanhood. . . . In conclusion, the chief takes the maiden by the hand and together they dance down the line, the company singing songs improvised for the occasion. . . . Sometimes the songs are grossly obscene. Every Indian utters such sentiments as he chooses in his song, though strange to say, they keep perfect time. The women utter nothing impure on these occasions."⁸¹

Such ceremonies are rather mild; but the South American tribes used to put the girls through ordeals fit to compare with those endured by the boys. To try the fortitude of their maidens, one Amazonian tribe hangs them up in a net to the roof of a hut, exposed to continual smoke, where they fast as long as they can possibly bear it.⁸² Among the Caribs, first the girl's hair was burned off, then she was gashed by the medicine-man with an animal's tooth on the back and pepper rubbed into the wounds. She must not betray any feeling during the operation. There followed three days without food or drink or any speaking, and then a month in a hammock without other sustenance than uncooked roots, cassava-bread, and water. At the end of the month these operations were repeated and only after the third month was the ordeal over.⁸³

§164. Social Distinctions.

THE Teda of the Sahara are divided into nobles and people, with princes at the head. Several chiefs have had extended authority; "but this was always based more upon the personal characteristics of the head-chief than in his official position, which is in itself neither very influential nor remunerative." The princes preside over the assembly of the nobles where questions of public policy are ventilated and decided. "The common people has no rights, but also no duties. Taxes are unknown to them; but their lot, by reason of the poverty of the country, is despite this no enviable one." Except in favored

⁸³ Schomburgk, *Brit.-Guiana*, II, 431.

spots they are almost wholly given over to the mercy of the nobility which is as numerous as it is poor and covetous. "In the western part of the country, where almost no agriculture can succeed, every third man is a noble—really a nobleman in rags and devoured by hunger, but on that account no less proud of his high origin, and not less arrogant and exacting."¹ "Unlike the other races of the Welle, aristocracy of family is recognized among the Mang-bettou. Between the chief and the people are a race of freed men, who do not engage in manual labor of any kind. From the term freed men it must not be inferred that the people below them are slaves; they are equally free, but are without the hereditary rank of the so-called freed men, who are generally relations of the chief or in some way connected with him. Thus, a chief may receive an application for porters, and may have sixty or seventy men around him, not one of whom he can lend. 'These men do not work,' is his answer, implying that they would not so demean themselves. The distinction of caste is carried out in war; the so-called free men carry spear and shield, while the lower orders are armed with bow and arrow only."²

The pure-blooded Bahima are a sort of aristocracy or ruling caste in several parts of Uganda, and even furnish dynasties of kings. There are four classes, including slaves, peasants, and two ranks of dignitaries. The peasants are by far the most numerous and constitute the army. The second rank of dignitaries is not hereditary, and peasants rise into it, their sons becoming peasants again; these second-class dignitaries are rulers of provinces under the first class. Elsewhere are found two classes, the free, noble, lighter-colored and the subjects.³ The Wasove people of East Africa are divided into five classes of which the first two are the issue of male and female members of the chief's family respectively; the third are the head-men; the last two are the peasants and strangers.⁴

Among the warrior-tribes of the Somali and Galla the entire people is divided into warriors and non-warriors. The former do not marry. The Masai have a middle class, who marry and go to war only occasionally. The warriors have four sub-classes and the non-warriors three. There are also the possessors and the possessionless, though in lesser number than elsewhere on the continent. The chief gathers the exceptional persons about him and gives them land, and from among them he selects his dignitaries.⁵ Madagascar shows three classes: nobles, citizens, and slaves. They may not, with few exceptions, intermarry, nor may the clans into which they are subdivided.⁶ Among the Tuareg the serfs tend the flocks, cultivate the oases, and fight under their masters; they are attached to the soil and may not be sold separately. Between the nobles and serfs is a superior class, the caste of smiths; they are charged with the making and repairing of weapons and enjoy much consideration. Professions are hereditary from father to son.⁷ Slaves among the Oromo are not circumcised, the practice being a mark of distinction between free and unfree,⁸ and recalling the similar significance of tattoo, as when Herodotus⁹ states of the Thracians that "to be punctured they thought a mark of nobility, to have no punctures, that of being basely born."

"All the Ostiaks are equal among themselves; even the so-called Ostiak princes are not distinguished from the rest. The rich enjoy, as everywhere, a special respect on account of their possessions. The laborers of the rich, however, stand upon an equality with them. They sleep, eat, and dwell all together."¹⁰ The Kirghiz have two classes, called the white bone and the black bone; the former are chiefs of families and magistrates, and are supposed to be the descendants of Genghis Khan. The black bone includes the rest who have no clear proofs of such descent.¹¹ Of the Cherkes it is reported that "the chiefs and nobles have no other business than war, robbery, and hunting. . . . The subjects or peasants, who render blind obedience to the chiefs and nobles, inherit their station; but they are not sold."¹² Tibet shows three classes: the priestly rulers, the warriors, and the peasants—the last pillaged by the first and second but pious to excess. India is the land of caste; the development of which it affords a classic extreme is reserved for a later connection. In China appears the nobility of letters; scholars, trained mainly in mnemonic exercises, and tested by competitive examination, held office, were too proud to work, and tended, at least in the upper strata, to become parasitic.¹³ The civil authorities regularly outranked the military. The military mandarin was actually debarred from the performance of religious ritual, while that privilege was accorded as of right to civil officials. This literary nobility is an odd twist in the mores. "One of the curses of Korea is the privileged class of *yang-bans* or nobles, who must not work for their living, though it is no disgrace to be supported by their relations, and who often live on the clandestine industry of their wives in sewing and laundry work. A *yang-ban* carries nothing for himself, not even his pipe. *Yang-ban* students do not even carry their books from their studies to the classroom. Custom insists that when a member of this class travels he takes as many attendants with him as he can muster. He is supported on his led horse, and supreme helplessness is the conventional requirement. His servants browbeat and bully the people and take their fowls and eggs without payment."¹⁴

In the Indian Archipelago there is no absence of rank and position, and "almost nowhere is found the idyllic equality of which some dream." Not only is there the difference between free and slave but there exists a sort of nobility or aristocracy composed of those stocks favored by fortune and position, among whom the chiefs and other officials and their families take first place.¹⁵ Although nothing is mentioned as to scales of rank below that of chiefs in Easter Island, except a reference to slaves, class-distinctions were pronounced among others of the Polynesian group, the most common social divisions being chiefs, middle classes, and common people, not to mention some who might be called slaves. In Samoa, next after the ruling class came the heads of families, who were the chiefs' councillors, then the body of citizens, while the lower classes were "men of the land," that is, workers without political rights and war-captives whose condition was little if any better than that of slaves. In Tonga there existed a group of honorable attendants on chiefs, their companions and councillors; the bulk of the people were peasants, and below them were persons who had forfeited their liberty by crime or had been taken cap-

tive in war. The class next after the king, in the Hervey Islands, was that of governors of districts; after these came the landholders and finally the tenants. There was not such inequality of rank as in Tahiti; caste did not exist as a system, yet each grade had its distinct position in society.¹⁶

On the island of Yap there is a class that is treated by the rest of the natives as a people under the yoke and fundamentally diverse of origin. A woman might lose all honors and rights of membership in her social rank or group by marrying a man of a lower rank.¹⁷ In the Marshall Islands there were four classes: chiefs; sons of chiefs, generally very rich and influential; people with property; those without property and enfeoffed only with land.¹⁸ In Ponapé the three classes are nobility, chiefs, and people, the last paying great respect to their superiors.¹⁹ In the Pelew group, the nobles' wives receive especial respect; "woe to the native who unsummoned and otherwise than in the most humble, bent posture should approach such a woman," though she may at that very moment be arranging by signs an assignation with him.²⁰ In New Zealand "a curious point was that the son was greater than his father, because he was the result of two great people coming together, while his father was only one great person." The child held rank both by father and mother; "from his birth the Ariki was the greatest person in his little world, till his own son was born." Class-distinctions were made at the ritual feasts when food for different ranks was prepared in different ovens.²¹

The rank-system of the Northwest Indians is very remarkable; in connection with it especially "are found well defined, narrow bounds within which the sense for the acquisition of property can act, since property can be amassed only to be distributed at certain festivals or even to be deliberately destroyed for the purpose of gaining repute and rank."²² Self-destitution for the sake of public recognition has been noted in the case of the potlatch.²³ Among the Tinné of Alaska, "the social organization seems to be divided into the following classes: Tyones, skillies (near relatives of a Tyone), shamans, or medicine men, and vassals of varying degrees of servitude. In all assemblies seats are rigidly assigned according to rank." Vassals are found at the beck and call of masters. A member of the master-class, fourteen or fifteen years of age, sitting within a few feet of the river, orders a six-foot vassal to bring him water. These menials are used for all kinds of work, and are under all possible control of their masters, but corporal punishment is not observable. The threat of deprivation of food or shelter, in their poverty-stricken position, would doubtless command obedience.²⁴ Among the Tsimshian "class prejudice was very strong," and all marriages had to take place among members of the same social rank.²⁵

Among the Arapaho there was an organization called "warriors," of eight degrees or orders, including nearly all the men above the age of about seventeen. "Those who were not enrolled in some one of the . . . orders were held in but little respect, and were not allowed to take part in public ceremonies

or to accompany war expeditions. Each of the first six orders had its own peculiar dance, and the members of the principal warrior orders had also their peculiar staff or badge of rank." Seven priests constituted the highest order of the military and social organization among the Blackfeet, Sioux, Cheyenne, Kiowa, and probably all the prairie tribes except the Comanche. "The warrior organization of the Kiowa . . . consisted of six orders, each with its own dance, songs, and ceremonial dress."²⁰ This instance reveals the relation between the men's organizations and the general class-stratification.

§165. Caste.

THERE is little evidence of a real caste-system among undeveloped peoples; a few cases approaching that condition will be cited before approaching the classic example of India. In San Cristoval, Solomon Islands, there are two clans, called Atawa and Amwea, which alone of the clans have no totem; they have traditions of hostility to one another. No Atawa can be enslaved; this is the difference in status which strikes the native most, and about which all agree. Amwea men and women may be bound, sold, beaten, or subjected to indignities, but Atawa men and women never. Amwea members who commit crimes are severely punished where an Atawa who offends may only be scolded. There seems to be some race-distinction here, the invading Atawa being fairer than the dark Amwea people whom they found in possession.¹ For a man in Malekula, New Hebrides, caste is a very important thing. "Both religious life and social position are inextricably bound up with it; and as a man's caste depends upon the number of large tusk-pigs he has killed at the sacred ceremonies, tusk-pigs come to play a prominent part in each man's life." A child is born without caste and rises in rank as each large tusk-pig is killed by his father at one of the sacred ceremonies. The castes are six in number; very few people reach the fifth rank, which is that of the chiefs. "The men of each caste eat together. A woman may cook the food for men of rank, but she may not take it off the fire, nor must she touch it after it is cooked; neither can she eat of it, not even of the scraps which the men have left. Each caste has its own fire, and Mr. Paton relates that one evening he saw a woman who had cooked three meals for her husband and two sons of different rank lean back and declare that she was too tired to prepare anything for herself: she would eat nothing till the next day. If a man of lower caste eats of the food belonging to the caste above, all men belonging to the higher caste must kill a pig. A man of rank must not be touched on the head; if a man of lower rank touches one of higher caste on the head, trouble will ensue." As social position and finally chieftainship depend on caste, and caste depends on the number of pigs killed, this grading seems to become a strong incentive to thrift. "A chief's son, being the son of a man with many tusk-pigs, will probably rise in rank much more quickly than a poor man's son, but any man can acquire tusk-pigs through thrift and care."²

The Loucheux of Alaska are reported to have been divided into three castes, designated by names which seem to signify "fair," "partly swarthy," and "swarthy." Those of the first caste lived principally on fish, and those of the last by hunting. They occupied different districts, and marriage between

²⁰ Mooney, in BAE, XIV, 986, 989.

¹ Fox, in JAI, XLIX, 121-124, 129.

² Sebbelov, in AA, XV, 273 ff.

two individuals of the same caste was almost prohibited.³ "Rank and caste play an important part in every Thlinget community. . . . The high-caste family strenuously opposes the marriage of one of its number to one of a lower class." At feasts the people are given positions and goods according to rank and caste, and in public councils "it would be considered a shame for those of high-caste connections to listen to talk from those of a lower class."⁴

Coming now to India, we find the suggestions included in the foregoing cases, that a caste-system implies ethnic differentiation, further developed. Rivers⁵ thinks the existence of two divisions of the Toda people suggests some form of the institution of caste. Each division is endogamous, as is the caste, and each is divided into a number of exogamous septs resembling the gotras of a caste. There is, however, little restriction on social intercourse between the two divisions; they can eat together, and a member of one division can receive food from any member of another. He inclines to the view that the present organization of the Todas is due to the coalescence of two tribes or castes which came to the hills at different times.

The first trace of modern caste is found in Manu's Code; but even there one fails to see the present rigid caste-rules as to food, connubium, and intercourse. It may therefore be safely concluded that the primitive division of Indian people into Brahmins, Kshatriyas, Vaisyas, and Sudras was based upon their occupations, but at present does not denote definite ethnological groups. "Thus, founded originally on occupation, their later divisions and subdivisions have been according to the habitations, languages, manners, or migratory habits of the people, and sometimes even self-interest or vanity. But when the social position of a person was determined by merit and not by birth, when the son of a Brahmin was not a Brahmin, and each of the four primitive divisions of society was continually refreshed by the best blood of those who had the greatest aptitude for the work of the class he entered, qualified by a long apprenticeship or previous training, there was no isolation of one caste from another." There were mixed classes, "represented as having arisen from the mutual connubium of the higher castes with the lower."⁶

In India and Ceylon the oldest political form of society was the village-community; "in it a part of the members took over this sort of work, another that, useful for the persistence of the community, and so there were formed inside of it small groups in which the occupation of the father descended to the son. Therewith was developed within the groups a special esprit de corps under the pressure of which the lines of distinction between the several crafts became ever deeper. . . . A group of neighboring villages was served, for example, by its own smith, and it fell to no other smith to do any work for this region. . . . Within a community a certain moderate number of castes sufficed for all the needs of the whole; but when in the course of time an absolute monarchy united all the separate communities under one single rule, then the demands of the king and court, and later also those of Buddhism, which had attained great power, gave impulse to the formation of new social divisions. If new tasks were laid upon a caste, then the caste-spirit split off new groups that soon lost connection with their mother-caste." Thus the weaver-class took over the getting of cinnamon-bark and the palanquin-bearers became executioners.

5 Todas, 679-680, 691.

6 Nathubhai, in JASB, V, 78, 89; III, 393, 421.

"The several sub-divisions of artisans feel themselves to be separate castes, and neither intermarry nor participate in a common meal. . . . Every contact with a member of another class is avoided as far as possible; on two points above all are the caste-taboos inflexible: on the intermarriage and on the eating together of members of different castes. In both cases unmerciful expulsion from the caste would follow, and the person so punished would be a lost man. Even the shadow of a low-born person falling upon food makes it useless for the man of a higher order. Where the caste-prescriptions still persist almost unlimited in their old strictness, . . . even the breath or the remote presence of a man of lower caste renders unclean, and the segregation that the members of higher and lower castes observe toward each other must be maintained to the most painful degree; for the higher-born, detailed ceremonies of purification must ensue upon such proximity."⁷

The Nairs, who have been famous as a military aristocracy ever since Marco Polo travelled in Asia, come next to the Brahmins and Kshatriyas and have precedence over all other castes.⁸ It is said that they are not a caste or even a tribe but are rather a community including various elements: an aristocratic group, a group of Sudras or menials, including drummers, musicians, potters, funeral priests, and so on. "The Tarakans, a class of brokers, have become Nāyars within living memory, and there is another section only partially assimilated, the members of which are refused admittance into the tribal sanctuaries."⁹

"The very strongest, and perhaps also ugliest, of all possible roots of caste is sense of race, the caste of blood." Protection from fusion is almost an instinct. "Here we have the secret of rigid caste, for the only rigid caste is hereditary, and of hereditary caste the essential characteristic is the refusal of intermarriage." Heavy fines are necessary to buy back a position lost by infringement of rules, say, on a European trip; and the unscrupulous make use of these fines to ruin those who resist their power.¹⁰ As for the connection of caste with race, we may see "the evolution of a caste out of a tribe, one portion being still to a great measure in a primitive state, while the other section has been admitted within the circle of Hinduism." In cases cited by Risley¹¹ such tribes had been aboriginal habitants and rulers of their district. He thinks that the position an Indian caste holds in the orthodox scale of purity and rank is correlative with the nasal index; "it is scarcely a paradox to lay down as a law of the caste-organization in Eastern India, that a man's social status varies in inverse ratio to the width of his nose."¹² Sub-castes are always differentiating; in southern India there are the right-hand and the left-hand castes, of long standing. "The right hand castes, for instance, claim the prerogative of riding on horseback in processions, and of appearing with standards bearing certain devices, and of erecting twelve pillars to sustain their marriage booths, while the left hand castes may not have more than eleven pillars, nor use the standards and ensigns belonging to the right hand fraternity."¹³

Ridgeway¹⁴ believes that distinctions of race and class went together in Rome and that "the dissensions between Patricians and Plebeians were far

more deeply rooted than in a mere struggle between capital and labour. The excavations of Boni in the Roman Forum have since shown two different kinds of graves, the one, cremation, and the other inhumation burials. This most important archaeological fact taken in conjunction with the different kinds of marriage, the one Patrician, the other Plebeian, the different armature of the original First Classes, consisting wholly of Patricians, as compared with that of the other Classes, into which Plebeians were enrolled, as well as the fact that the three chief Flamines who must be Patricians ministered to Sabine deities, all combine to show that the Patricians were Sabines, the Plebeians the aboriginal population."

§166. Plutocracy.

MANY uncivilized people think that the common man after death is annihilated or goes to a region of gloom while men of noble blood descended from kings go to a realm of delights.¹ Allied with this is the notion that the wealthy fare better than the poor. Dyaks think the spirits pay far more heed to a rich man than to a poor vagabond.² In the New Hebrides it is believed that spirits rank in the other world according to the number of pigs they bring with them, that is, the number killed at their funerals.³ In Eskimo life, good food-winners are the greatest heroes and these are the ones who get to the abode of the blessed, although they must also avoid evil.⁴ It was believed in the Scandinavian mythology that souls ranked in Valhalla according to the wealth they brought with them. In the Eddas the leaders have gold and are generous with it, and the desire for it ranks as a motive with love of fighting. Gold is represented as the cause of good and evil; this had been learned from experience but observed evil effects had not led to any renunciation of wealth. These are typical examples of the projection of plutocratic ideas to the other world. Illustrations of the influence of wealth in society follow.

A man made himself king of the Basutos in 1815 by exchanging his cattle for women whom he gave to his adherents for wives. All their daughters were his for further operations.⁵ Such practice has been alluded to before and will appear again. In equatorial Africa, riches consist in having a great number of wives and slaves, whom the owners can compel to work as they please.⁶ We note once again that "ivory is everywhere an evil thing before which the quest for gold sinks into a parlor game."⁷ Among the Ba-Mbala drunkenness is a sign of wealth and is much respected.⁸ Property is uncommonly evenly divided among the Galla, but with neighboring peoples "only the greater or less wealth in cattle decides as to who may approach the prince and who may stay permanently near him. The chiefs of the several families . . . have a position in no way preferred in so far as they do not stand out through their wealth in herds." The Somal chief keeps in his intimate presence "men of his tribe who are noteworthy for intelligence, courage, experience, family connections, and, in consequence of this, also, for the most part, dis-

tinguished for wealth, counsels with them over important business, and listens to their advice before making weighty decisions."⁹

Yakut plutocrats give out horses to the poor for an annual rental; also the rich pay in wares which the employee must often sell at a loss, compelling the latter also to hire to the same employer for a year before receiving any payment. The rich are powerful in Yakut society and surpass the Russians in the exploitation of their fellows. It is a violation of etiquette at an entertainment to give a big piece of meat to a poor man and a little piece to a rich one. The contrary is the rule.¹⁰ While the Gilyaks have no aristocracy, the wealthy enjoy great prestige.¹¹ In Kafiristan "rich men give great feasts, qualifying themselves in this way for high social and religious rank in the tribe."¹² If Hindu descendants do not keep up sacrifices, the ancestral ghost may decline to a stage where he must go through life again. A man now poor is so because of faults in a former existence; he cannot pay for rites now by which to get a high place beyond. Hence he may stay base forever.¹³ Of Indian tribesmen it is reported that "there is nothing they will not do for money"; everything is accomplished by the rupee, which plays a greater rôle in India than the ruble in Russia.¹⁴

Wergeld is a plutocratic device. Malay misdemeanors are atoned for by payments and if they are not forthcoming, the culprit is enslaved. Debt-slavery, so flourishing in the Archipelago, is a prominent factor in forming class-strata.¹⁵ "On the Pelew Islands, just as in all the Malay states, money can atone for every punishment for every political, social, and religious transgression. Since no taxes exist the fines form the income of chiefs; they are their 'fountain.' . . . In social life everyone is forced by custom to take on expenses exactly corresponding to his position in the community. Everyone is responsible for his cousins, his children, and his clientage and must pay for them. . . . Family life can be founded . . . only upon the basis of money. . . . In illnesses finally the anger of the gods can be assuaged only by frequent payments to priests, seers, magicians, exorcists, and their ilk. Even the dead may not be buried unless first the sum set by usage is paid. The marvel is that with the existing limited supply of money the inhabitants are able to discharge these numerous payments, and it is therefore understandable that the demand for money and the eagerness to get it is inevitably very great. In order to meet this need of acquisition of money, Pelew Island custom has tried its own solution of the 'labor and capital' question, and since 'money' was presented as a 'conditio sine qua non' of societal existence, there has been an effort to regulate its circulation in the society. To this end belongs the idea of preventing an injurious centralization of money in the chiefs' possession by placing them upon a full equality with the people in the matter of penalization, and further in the most exact determination of the customary services owed by them to the people and the other chiefs, whereby the great expenditures saddled upon them bring the money down among the people. On the other hand, an exclusive accumulation of money . . . is made impossible by the provision that no one may live independently or produce exclusively for himself.

15 Marsden, *Sumatra*, 247; Wilken, *Vhde.*, 422; §§105, 106, of text.

He may not use things which he himself has made, but must sell them; on the other hand, he must buy and pay for that which is for his own use. Here again, in order to control exploitation and exceptional opportunity, the prices and payments are stable, that is, determined beforehand, unchangeable, and known to everyone. There appears, then, as the fundamental principle of the above indicated social laws, the greatest possible decentralization of society through a mathematically exact and detailed regimentation."¹⁶

This exceptional system is enlightening as representing a determined effort to withstand the power of unequally distributed wealth. It is more usual to find "dishonorable plutocrats" to whom wealth is virtue and poverty vice, and a situation where "the highest chief exploits the poorest man as much as he can." There is an "unexampled struggle, which stops at nothing, to get rich." An old chief, with one foot in the grave, sought magic to attain wealth; the ancient glass and stone money was boiled and the water poured over children's heads, or given them to drink, to make them get rich. Bribery cannot be withstood. A man tries to get a wife from a rich family so that for every fault of the wife he can collect from her parents; and a father wishes to marry his daughter to the son of a wealthy house, for then he can foster differences between her and her husband and collect fines from the latter's father, who goes security, as it were, for his son's actions. "The power of money appears, with this little people, much more unadorned than in our country; for the greater simplicity of all social relations and the necessity of maintaining the laws of the land through tradition in the highest possible degree of immutability cause the driving forces to stand forth much more sharply here."¹⁷

The Eskimo of Labrador think that the owl annoys by its hooting only those people who are too poor to have extra garments; when they hear it they hasten to hang out some unworn piece of clothing.¹⁸ Feasts are sometimes given by the Tlinkits to whitewash a disreputable character. "If a man has disgraced himself in the eyes of his people, he may give a generous feast, and no one after that is allowed to mention or talk about his dishonourable conduct. Giving a feast wipes out the stain, and the sinner may hold his head as high as ever."¹⁹ Standing in the Haida tribe depended more on the possession of property than on ability in war, "so that considerable interchange of goods took place and the people became sharp traders."²⁰ Wealth consisted principally of implements, wives, and slaves. As to the totem-poles of the northwest coast, "none but the wealthy can afford to erect these carved columns and the owner of one is thereby invested with so much the more respect and authority that he becomes as the head of the household a petty chief in the village."²¹ Among a people in Oregon, "no marriage is legal or binding unless preceded by the payment of money and that family is most aristocratic in which most money was paid for a wife. . . . So far is this shell-money aristocracy carried that the children of a woman for whom no money was paid are accounted no better than bastards."²² Of the Brazilian tribes it is stated: "It is astounding what differences there are amongst these wild people between rich and poor," that is, not between rich individuals and poor individuals, but between tribes that are comparatively well off and those that are in hard circumstances. The chief of one

of the poorest of the villages on the Shingu, speaking of other tribes, said that they were rich because they had stone axes.²³

Chinese ancestor-worship is said to owe its great strength to the fact that it is a system by which the living man expects to make the grave of his ancestor a fountain of material blessings, long life, property, and rank, to himself.²⁴ The Zoroastrian religion was in practice a grand system of operating on the good and evil elements (spirits) by the individual to further his own luck in material goods, wealth, and power. The sanctions of the Jewish religion were material: longevity, wealth, power. The Greek religion hinged in the large on the aleatory element in life. Democracy and plutocracy were the reigning forces, plutocracy being the power of those who had, democracy of those who had not. At Rome "property and honor, property and full citizen-rights, property and social prestige were identical. Property was the criterion by which the worth of an individual in the state was measured. Property was won by pains and diligence and so it was the touchstone of the community. The related peoples held the same view."²⁵ Mediæval religion, though theoretically it looked to the other world, was a system of ritual the strength of which lay in the guarantee of good fortune here. All the historical religions have fostered indiscriminate giving; Confucianism, Buddhism, Mohammedanism inculcate charity—as a duty for the benefit of the giver, however, not of the receiver. The mediæval church taught the same view. It was well to have riches to give, but it was also well to be poor. In fact, if a poor man had been lifted out of poverty, which in the ecclesiastical view was a higher state than wealth, he would have undergone religious harm. The result was that the care of the poor was both wasteful and inefficient.²⁶

§177. Retaliation.

Suicide. The Chuvash in Russia hang themselves at the gate or under the eaves of one on whom they wish to take vengeance. The Votyaks hang themselves on the premises of an enemy. This notion prevails widely in India and is explained by the belief that after death the ghost of the suicide can plague the one who drove him to this act. A modern Hindu threatens to commit suicide on the doorstep of a great man who has oppressed him and has refused to heed remonstrance. If he is not heeded, he executes the threat. Both believe that the ghost of the suicide will be an enemy of a very different caliber from the oppressed mortal being. Lasch,¹ from whom these cases are taken, suggests that this kind of suicide is a form of blood-revenge, in that the suicide causes blood-guilt to fall on his tormentor without incurring it for his family. The Hindus think that "one who rejects a suppliant and compels him to kill himself goes to hell." Hence a beggar coerces a giver by besieging his door and threatening to commit suicide there.² It is quite logical for those who think that ghosts have great power, to wish to become ghosts in order to attain ability to wreak vengeance. Among the Tlinkit "a man committed suicide simply to make trouble for one who offended him. According to native custom, if a person commits suicide because some one has offended him, or opposed a wish

of his, heavy damages or a life must be given to the tribe of the suicide by the tribe of the one giving the offence. So suicide is sometimes resorted to in order to harass and burden others. The threat of suicide is sometimes used as a bluff to get one's way."³ Slaves in Brazil commit suicide in order to do pecuniary harm to their owners by way of revenge.⁴ The hunger-strike is a modern parallel.

§178. Blood-Vengeance.

WHEN a death occurs in Melanesia the natives usually insist upon "taking payment," which applies not only in cases of murder but even under other circumstances, as when vengeance was sought on a man by his wife's relatives because she hung herself after quarrelling with her mother-in-law. Murder commonly leads to inter-tribal war, though hostilities may be averted if the murderer is given up. Vengeance is satisfied if one, anyone, of the offender's group is killed in battle, but as more were frequently killed, "battles such as these, instead of terminating a blood feud often started new ones, and in time might lead to a chronic state of enmity, punctuated by new murders and reprisals." In such warfare, not only was it meritorious to kill, but if possible prisoners taken were carried off to be tortured before they were eaten. "Such vengeance was looked upon as a duty, and to this feeling must be attributed the greater number of the murders of white traders that took place some fifteen to twenty years ago among the archipelagoes of the south-eastern extremity. Natives had been taken from many islands for the labour trade, and when they failed to return and no compensation was paid for their assumed deaths, these were avenged by the killing of the first stranger who gave himself into their keeping." Commonly prisoners would be tortured and killed only in such numbers that their deaths made the score even between their community and that of their captors.¹

The principle of like for like is literally applied by the Bageshu. "If a man kills one of another clan, the members of the clan seek out either the murderer, or, failing him, some one of his clan about the same age as the person killed, and put him to death. If they are able they get a son of the murderer and they will sometimes wait a number of years until a child grows up in order to kill him when he reaches the age of the man who was murdered."² Among the Bahima, "it is the positive duty of each member of the clan of a murdered man to seek out and bring to justice the guilty person; if ordinary means fail to trace the murderer they seek out a clever diviner, who, by his magical arts, is supposed not only to discover the perpetrator of the murder, but also his motives for the deed. Should the person accused be found, he is put upon his trial, and if he denies the deed he must go through various ordeals to prove his innocence; it is next to impossible to escape death, because the reputation of the diviner is at stake, and he cannot allow that he has made a mistake, unless the relatives of the accused make it worth his while to find some other scape-goat. Should a murderer escape, one of the clan is seized and put to death, unless the clan rises and rescues him; if the clan rises the case goes before the king for trial; the king invariably settles the matter by imposing a fine.

³ Jones, *Thlingets*, 218.

⁴ Tschudi, *Reisen in S. Am.*, II, 77.

¹ Seligmann, *Melanesians* (1910), 128-129 (quoted), 271-272, 566, note, 569 (quoted), 570;

Rivers, *Melan. Soc.*, I, 172; Murray, in *AAAS*, 1921, 179.

² Roscoe, in *JAI*, XXXIX, 194-195.

But more frequently the murderer or the person seized in his stead is put to death before the members of the clan have time to rise. In some cases of murder, the clan of the murdered man may refuse to accept the fine ordered by the king; they wait on in the hope of finding the murderer, or until they are powerful enough to fight the clan of the murderer and kill some one of it. Directly a case is settled either by fine or by a substitute being killed in his stead, the murderer can return, his clan will receive him, he may go home; even the relatives of the deceased will bear no ill will toward him."³ The old blood-feuds are still recognized by the Kavirondo, and a man may not eat with a person with whom his branch of the family has a blood-feud, or, it is believed, he will surely die within twenty-four hours. Group-responsibility among the Akamba is evidenced in the matter of compensation: all relatives of the murderer contribute their share and each member of the family to which the murdered man belongs receives a share of the compensation. The same people have a way of getting rid of an obnoxious person, one who kills people by witchcraft or poison, for example, and at the same time of avoiding compensation. If a number of persons have fallen victim to the machinations of the accused, the principal elder announces: "If one man kills the accused it means compensation, so we will do it all together and then no one will be able to say that any one man killed him." Then the people rush in a body at the accused and put him to death.⁴

Blood-revenge is known in the Congo, and often causes inter-village warfare; hostilities do not cease until a slave belonging to the village of the murderer is handed over to be eaten.⁵ The Dinkas accept compensation in cattle for homicide resulting from accident or sudden anger; if, however, the deceased has been waylaid and killed, compensation is not accepted and "the only remedy in this case is to wait until one of each family is killed; then the 'old people' can meet with better chance of arranging a 'peace sacrifice' and peace-making." After killing, the offender generally hides or goes to another tribe for shelter and his family try, if possible, to arrange a "peace." If, at the meeting, the family of the offender refuses the decision given by the "seniors" of the people, a blood-feud is instituted and killing by stealth goes on until peace is finally effected.⁶ Sir Charles Dundas⁷ explains in a significant statement why blood-revenge rather than compensation prevailed among the East Africans before its check by the British: "When questioned as to the penalty provided by their law for the taking of human life, natives invariably speak of compensation to be paid to the deceased's relatives. But we can imagine how ineffectual such a penalty would be among men who, even if not bloodthirsty, always have little control of their passions, and who have scant if any chance at all of finding redress other than by personal retaliation. Moreover, the amount of compensation is usually not so exorbitant that the average well-to-do man cannot easily pay it, and since it is mostly paid by the family or even the whole clan, it is in effect hardly a penalty at all on the evildoer himself. It may be said here that whenever we find native law seemingly lax or ineffectual to excess, it is to be suspected that we have either not got to the root of it or that there are underlying aspects of the law which are not apparent to us.

⁶ O'Sullivan, in JAI, XL, 189-190.

⁷ In JAI, LI, 236 (quoted), 237-238, 242.

So it is with the law of homicide, for the truth is that compensation or blood-money was formerly not the normal penalty for homicide, but rather it was a composition voluntarily accepted in lieu of blood revenge, which is now suppressed by us, and therefore not often spoken of by natives." In former days the rules prevailing here for inflicting vengeance varied considerably: in some cases, if the murderer could not be found, any member of his clan or locality could be killed; in others, near relatives only, or a brother only, or the murderer's wife, or his sister; again, the rule required only a male for a male, only a woman for a woman.

In northeastern Africa, one "may not rest until he has taken blood-vengeance, and in his fury he not seldom kills people who are known to be harmless, provided only they belong to the hostile tribe." Yet blood-guilt can be atoned for by blood-money paid to the relatives of the murdered person. Among the Somal "the family of the murderer may either pay blood-money, or deliver up the murderer, or do battle." What they do is determined by the circumstances of the deed or by the eminence of the man; and the amount of blood-money is likewise adjusted to the circumstances of victim and murderer. If the murderer cannot pay at once, he is delivered to and held captive by the relatives of the murdered, till his family can raise the sum. "Blood-money falls upon the nearest family-relations and never upon the tribe." The penalty is generally put very high, but there ensues dickering, and it is seldom paid in full. If there is a fight in which a number are killed, and then the blood-money is not paid within a proper time or is refused, the tribe demanding redress kills as many members of the one refusing it as the former lost in the fight. Out of this, inasmuch as excuses for delay generally follow, grow new rights to compensation. "That blood-revenge . . . is not dissolved by a money-penalty, without doubt has its basis in the dense population of the Galla region."⁸

Among the Kabyles the blood-debt is contracted by the family of one who has committed homicide in time of peace. It is satisfied only by the death of the designated victim; wounds, however severe, are not sufficient. It is a head for a head. It is of little importance that the victim perished by an act of imprudence, or in a conflagration, or at the moment of perpetrating a crime. A minor child or an idiot is not exempted from vengeance; nor is the owner of a vicious animal. The latter is regarded as the direct author of the death of anyone killed by the animal.⁹ In Egypt "the homicide, or any person descended from him, or from his great-grandfather's father, is killed by any of such relations of the person whom he has slain. In many instances, the blood-revenge is taken a century or more after the commission of the act which has occasioned it; when the feud for that time has lain dormant, and perhaps is remembered by scarcely more than one individual."¹⁰

Vengeance by blood was considered by the Koryak to be the duty of all blood-relatives, and not of single individuals. "A consanguineous group consisting of one or several families was also jointly responsible for a murder committed by one of its members, and in so far must be regarded as one juridical personality. We know that the old men often attempted to check the spread of blood-revenge. For this purpose ransom was resorted to." Com-

pensation in money is a secondary and a modern consideration, and among the Gilyak cannot always, even nowadays, replace the ancient duty of exacting blood-revenge for manslaughter. Vengeance is demanded, even against animals: "if a man is killed by a bear, he must be avenged by the death of the animal in question, or of another bear in its place." Religion reinforces the custom, for "the soul of an unavenged victim cannot go to the land of the dead, but must remain near the living, incarnated as a bird-avenger, . . . and finally crumbles into dust. . . . As the soul of a murdered man, like that of any other Gilyak, continues to exist only for three generations, so the obligation to take vengeance for his blood binds his fellow clansmen only till the third generation if the act of vengeance is not performed by a contemporary. Vengeance is never executed upon a woman, or upon the private property of the guilty person."¹¹ Among the Ossetes, "my cousin in the hundredth degree, who bears my name, is my near relative, and I am, under proper circumstances, under obligation to take or to demand blood-vengeance for him; but my mother's brother is not my relative, and if he is killed I cannot demand expiation for him." This community of blood "alone guarantees political protection and assures the independence of the individual." Mere wounds may be compensated by money, according to a scale set by an elected tribunal. The society takes over the less serious cases of infringement of rights, that is, while the most serious is still left to the primordial method of settlement. A more developed form is where a tribunal decides and all parties are under curse if they do not carry out its decisions. They know no laws, but only customary rights.¹² Blood-revenge is practised among a number of other tribes in Russia. Whether the manslaughter was intentional or not, one who has committed a homicide is bound to send to the family of the slain every month for three years a sheep for each person. In the fourth year he makes a bargain to discharge the obligation.¹³

In certain parts of India observers find "the chief social restraint in the system of blood feud, a system which seems to have penetrated the whole social structure." These communities are thoroughly imbued and actuated by the idea of kinship. "When any difference occurs between two men of the same village, which is rarely the case, each individual has his party who cling to him and take up his quarrel, not by any means from a sense of justice, but from relationship—and a civil war ensues. The result of this system Stewart found to be a reluctance to enter into quarrels which entailed consequences so disastrous, and hence a society 'living in general peace and honesty.' He compares the action of the law or revenge as an efficient deterrent among the clans of the Scotch Highlands some 150 years before the date of writing. The restraint of life governed by inexorable blood feuds was mitigated among these North Kachar Nagas by a quaint custom. At stated times, once or twice a year, the whole village adjourned to some convenient place, and a general *mêlée* took place, everyone fighting for his own band. No weapons were used, but severe bruises and scratches resulted, yet these never gave ground for a quarrel, 'whereas at other times the lifting of a hand would lead to a blood feud.' This excellent system afforded vent for private grudges."¹⁴ Again, "individual blood feuds were kept alive . . . by a custom by which men might be hired to carry on a quarrel, 'when the males of a family were wanting or unable to do so.' . . .

¹⁴ Godden, in *JAI*, XXVI, 174.

Murder admitted of no expiation, and instant death might be inflicted by the relatives of the murdered person, without reference to the council of elders, or even ten years after the deed the murderer might be surprised and killed; revenge for the death of a relative was considered 'a sacred duty never to be neglected or forgotten.'¹⁵ "The blood feud of the Naga, as with the Corsican 'vendetta,' is a thing to be handed down from generation to generation, an everlasting and baneful heirloom involving in its relentless course the brutal murders of helpless old men and women, innocent young girls and children, until, as often happens, mere family quarrels, generally about land or water, being taken up by their respective clansmen, break out into bitter civil wars which devastate whole villages."¹⁶ "It is difficult to determine the cause or causes which involve participation in blood-feud. It may be said, however, that blood-feud involves the rendering of assistance by others, and it commences, therefore, with the group to which an individual belongs. It is only through such assistance that the compensation, whether in blood, cash, women or kind, which must inevitably be demanded for wrong done, can be obtained. It follows that, where a quarrel ending in murder takes place between members of one family, a blood-feud does not necessarily arise, for no one will assist the murderer. . . . But ordinarily, if an individual of one group is killed by an individual of another group, it is at once incumbent on the group to which the murdered man belongs to take blood for blood. Thus, if the antagonists belong to different groups within the tribe, we have two internal groups engaged in blood-feud, . . . and . . . each is likely to be joined by other groups, until the whole tribe is engaged in a fratricidal struggle. Or, if the murdered man is of a different tribe to the murderer, the feud may be taken up by the whole of two tribes, each of which may again be joined by other tribes, so that a small spark soon sets a large conflagration ablaze. Nor is the feud composed until a reckoning of death for death has been made and compensation paid to the group in which the largest number has taken place."¹⁷

In old Japan, blood-revenge was recognized under cognizance of the authorities and with certain restrictions. The great warrior-statesman "Iyéyasu himself maintained it—exactng only that preliminary notice of an intended vendetta should be given in writing to the district criminal court. The text of his article on the subject is interesting:— . . . A person harbouring such vengeance shall give notice in writing to the criminal court; and although no check or hindrance may be offered to the carrying out of his design within the period allowed for that purpose, it is forbidden that the chastisement of an enemy be attended with riot. . . . Why the duty of vengeance was not confined to the circle of natural kinship is explicable, of course, by the peculiar organization of society. We have seen that the patriarchal family was a religious corporation; and that the family-bond was not the bond of natural affection, but the bond of the cult. . . . To strike one's natural parent was a crime punishable by death: to strike one's teacher was, before the law, an equal offence. This notion of the teacher's claim to filial reverence was of Chinese importation: an extension of the duty of filial piety to 'the father of the mind.' . . . A peculiar interest attaches to the Japanese vendetta in view of the fact that it conserved its religious character unchanged down to the present era. The *kataki-uchi* was essentially an act of propitiation, as is proved by the

¹⁵ Godden, in JAI, XXVII, 24, 25.

¹⁷ Risley, *Ethnol. Ind.*, I, 71.

rite with which it terminated,—the placing of the enemy's head upon the tomb of the person avenged, as an offering of atonement."¹⁸

The head-hunters keep a sort of reckoning in heads which amounts to a chronicle of blood-vengeance. Dyak wars arise out of quarrels dating from the days of their forefathers, and the reasons they give are connected with the adjustment of the account in heads. Some tribes keep the strictest accounts, and always know just how many heads are owing between them.¹⁹ The Aétas of the Philippines, when sallying out for vengeance, warn their friends off their line of march; for they mean to kill the first living thing they encounter to expiate for a death, even where there is no murder in question.²⁰ On the island of Yap, if a person is killed while doing something that is forbidden, there can be no blood-vengeance; if, for example, anyone is killed while creeping into a strange house or going through the village at night without a fire-brand.²¹

Private quarrels gave birth to public quarrels in Polynesia, "for the collective body of natives was affected by an offence against an individual." Revenge on account of a murdered father or friend, if not obtained during the lifetime of the injured, was handed to posterity. In Samoa sticks were planted in the ground and renewed as they rotted until the wrong was avenged. Punishment might fall either upon the offender himself or upon some other member of his family. In Tahiti a woman bathed herself in the blood of her murdered sons on swearing revenge, while a blood-feud was sometimes indicated by a person causing his own blood to flow.²² The following case from New Zealand will recall primitive ideas of property in their connection with the subject under review. "The shedding of blood was always considered a most serious thing, although but a drop were shed. A gentleman entering the writer's house knocked his head against a beam and cut his eyebrow so that blood flowed; the natives deplored the accident and said that according to their law the house would have been forfeited to him, and as they were of his party, it would have been their duty to have seen it given up to him, as every one present was affected by his blood being shed. In the same way, if a canoe should be dashed on shore in a storm, and the owner's life endangered he thereby acquires a title to the spot on which he is thrown. When blood is shed, it is the duty of every one related to the person who has suffered to seek for revenge. It does not matter whether it be the individual who drew it or any one else belonging to his tribe; but blood must be shed as an atonement for blood. This was one of the most fertile causes of war in former times. There were no cities of refuge to which a manslayer might flee, and his act endangered the lives of every one in his tribe."²³

Among the Eskimo near Hudson Bay, "in the case of a premeditated murder, it is the duty of the next of kin to avenge the deed, though years may pass, while the murderer pursues his usual occupations undisturbed, before an opportunity occurs to the relative for taking him by surprise. Sometimes the victim is not overcome and turns upon the assailant and kills him. The man, now guilty of two murders, is suffered to live only at the pleasure of the people, who soon decree his death. Murder is not approved, either by the individual or the community."²⁴ Here we see a distinction upon the basis of premeditation,

and also the entrance, in an extreme case, of the community as the avenger. Among the Central Eskimo there is no way of punishing transgressors except by the blood-vengeance. It is not rare that when a man offends another, the latter kills the former. It is then the duty of the nearest relative of the victim to kill the murderer. "Their method of carrying on such a feud is quite foreign to our feelings. Strange as it may seem, a murderer will come to visit the relatives of his victim (though he knows that they are allowed to kill him in revenge) and will settle with them. He is kindly welcomed and sometimes lives quietly for weeks and months. Then he is suddenly challenged to a wrestling match, and if defeated is killed, or if victorious he may kill one of the opposite party, or when hunting he is suddenly attacked by his companions and slain."²⁵ "Blood revenge is considered a sacred duty among all the Eskimo, and it is a common thing to find men who dare not visit certain villages because of a blood feud existing, owing to their having killed some one whose near relatives live in the place."²⁶

Blood-revenge was common among the American Indians. Many cases of massacre of war-captives are to be explained by the fact that the war was one for blood-vengeance.²⁷ Revenge was a duty not to be forgotten. It is said, for instance, that on the spot where the relative was killed in a fight a piece of cloth was dipped in blood and kept as a remembrance until his death was avenged by killing the slayer or one of the males of his family.²⁸ The Indians feared especially the unappeased ghosts of the murdered; flight from or composition with the avenger of blood was common.²⁹ One of the reforms of Hiawatha is said to have been "the regulation to abolish the wasting evils of intratribal blood-feud by fixing a more or less arbitrary price—10 strings of wampum, a cubit in length—as the value of a human life. It was decreed that the murderer or his kin or family must offer to pay the bereaved family not only for the dead person, but also for the life of the murderer who by his sinister act had forfeited his life to them, and that therefore 20 strings of wampum should be the legal tender to the bereaved family of the settlement of the homicide of a co-tribesman."³⁰ But the governmental system had not yet taken retaliation out of the hands of its constituent kin-groups. "The European settlers in the colonies of Pennsylvania and New York could not understand why, when in time of peace an Indian murdered a white man, they could obtain no redress from the tribal government with whom they had treaty relations. They regarded such indolence as breach of faith and proof of evil intention. It was nothing of the kind. A crime of blood was something which concerned the consanguine gens only; it was a family matter with which the tribal council had no concern and about which it could take no action; it was in no sense a crime against the commonwealth. This view of the case was something wholly incomprehensible to the Europeans, who belonged to States where a felony or a breach of the peace is something quite different when the nation appears on the stage of history from what it is in the tribal condition."³¹ Among certain California tribes, if wergeld is paid without higgling, the slayer and the avenger are at once reconciled. If not, the latter must have the former's blood, and the system of retaliation thus initiated might go on endlessly were it not

that it may be arrested at any stage by money-payment.³² The mode of settling troubles is to kill enemies at the first favorable opportunity, and then, if the murderer wishes to avoid a like fate, he settles with the relatives of the deceased, paying, according to the rank and station of the dead man, in Indian money—perhaps in white deer skins or woodpeckers' heads. All are thereafter supposed to be friendly. The wergeld is worth a hundred dollars for a man and fifty for a woman. "A man's life is valued . . . at six canoes, each one occupying in its manufacture three months' time of two Indians, or the labor of one man for three years."³³

Of the Indians of the northwest coast we read: "In their disregard for the lives and feelings of slaves, and in their practices of compounding murder and other crimes by the payment of indemnity to the relatives of the injured, we see simply the operations of custom, which with them has the force of law. Murder, seduction, wounds, accidental killing, loss of articles belonging to another, refusal to marry a widow according to law, *casus belli* in general, any wrong may be righted by payment of an indemnity in the currency of the region. . . . Wars are frequently avoided by an indemnity arrangement, and they go so far in this system of compensation that they demand payment for losses from parties who have been in no way instrumental in causing them. For instance, an Indian at Sitka broke into the room of two miners in their absence, emptied a demijohn of liquor, and died in consequence, and the relatives of the robber demanded and received payment from the unfortunate Caucasians. If a man be attacked by a savage dog and kills him in self-defense, he must pay for the dog to the Tlingit owner. A small trading schooner, while running before a furious gale, rescued two Tlingit from a sinking canoe, which had been carried to sea. The canoe was nearly as long as the schooner and could not be carried or towed, seeing which, the natives themselves cut the worthless craft adrift. When the humane captain landed the rescued men at their village he was astonished by a peremptory demand for payment for the canoe, backed by threats of retaliation or vengeance."³⁴

Thirst for revenge characterizes the Indians of British Guiana, a craving which is not satisfied until the offender himself and indeed his whole family is exterminated. "Blood-revenge is followed out by the Arawaks into its extreme consequences."³⁵ "Since the conception of blood-vengeance is very dominant and powerful among the Brazilian savages, it is taken for granted in the common council that it must be carried out; but whether, through the individuals concerned, merely upon the malefactor, or upon the tribe itself—that is the subject of the deliberation." Avengers paint black spots on their bodies, or cut off the hair. Again, "blood-revenge is practised still by the tribe with the energy and craftiness of the nature-man. It has its ground chiefly in jealousy and injury to marital rights."³⁶ Among the Jibaro blood-revenge is not strictly individualized in the sense that it always directs itself exclusively against the slayer: "The Jibaro certainly first of all wants to take revenge on the person who committed the crime, but if he can not be caught it may instead be directed against some one of his relatives—his brother, his father, even his mother or sister."³⁷ The Fuegians "are not very particular when seeking to revenge

bloodshed on whom they revenge it, so long as the victim is one of the same clan, whether man or woman. Sometimes the murderer is suffered to live, but he is much beaten and hurt, and has to make many presents to the relatives of the dead."³⁸ The law of retaliation was the only one understood by the Araucanians, "although the keen commercial spirit of the Araucano led him to forego personal vengeance for its accruing profit. Thus every injury had its price, which varied with the importance of the offended. . . . Parricide, infanticide, wife-murder, intentional abortion, and similar acts committed within the first rank of blood relations were not considered as crimes, it being held that these relations were of the same blood, and that it was allowable for anyone to shed his own blood."³⁹

Among the Arabs, "blood-revenge could be abrogated only by punishment. But this presupposes law and authority, not the moral ideal. Once the tribe may well have exercised real authority over all its members so that within its range the prevalence of blood-revenge was impossible. But we do not know these times. . . . For no public law of state had been developed which could have called a halt to the monstrous demands of family-sentiment and to the private right of feud. Thus are explained too the conflicts between little kin-groups shortly before Islam, which threatened to dissolve everything into a wild chaos. But how full of blessing here was Islam, in that it gave the split-up people a new idea and a new principle of law. . . . Upon the natural foundation of the family, the close blood-kinship, was based a solidarity which was scarcely capable of dissolution." Blood-revenge was regarded as a family affair, as war was a tribal; every case of blood-spilling within was reckoned a murder. "Therewith the slayer came out into a quite new light; he was a criminal and was personally responsible for his guilt." Closely connected with the kinsman was the guest-friend, for his relations were with the separate families rather than the community. The guest-friend was not exposed to the vengeance which his entertainers might be under obligation to take on the tribe from which he came. If he was a fugitive or outlaw from his tribe, he must be protected against it. It is the greatest disgrace to have killed one's guest-friend. Medina was one of the most unfortunate pre-Islamic cities, for the two chief tribes occupied the region and the bloodshed was copious. Various attempts were made to avert it. The simplest was to surrender the murderer to the avenging tribe, and it was tried. But the practical means was found in the wergeld. Though nobody could be legally forced to accept it, the custom took root and became widespread. But it is an error to think that the arrangement of wergeld looked to the complete abrogation of blood-vengeance. The two disparate expedients stood side by side, and it cannot be said that one was capable of merging into the other. "The one was the utilitarian, which accommodated itself to the acceptance of money-reparation, the other that of Arabian family honor, which held any such acceptance to be a disgrace. In it religious motives were plainly embodied. . . . The maxim of the genuine noble Beduins went: 'The bird of the dead cried until he had had to drink.' This way of looking at things has never been overcome; it still lives on today despite Islam. We are told of a proverb of a Beduin tribe of the nineteenth century, which runs: 'Even if it means suffering hell-fire, we do not let go blood-vengeance.' Thus the principle was not to be overcome, though it could be cut across, by the ar-

³⁸ Bridges, "Firelanders," in *Voice for S. Amer.*, XIII, 201.

³⁹ Latham, in *JAI*, XXXIX, 356.

rangement of blood-money; the practical advantages which were here presented were too great to win no elbow-room. . . . But since a full harmony between the disputing parties was scarcely to be attained without mediators—commonly the guilty party was inclined to the payment of wergeld, while the injured called for blood—in burning cases judges were appointed. For that they took persons of high reputation"—generally members of the tribe's princely family, for the function seems to have lost its religious significance.⁴⁰

Blood-revenge has long been a custom among the South Slavs and occasionally occurs today. It is forbidden within the *bratstvo* or kin-group, and one method of reconciling a blood-feud and preventing further fighting between *bratstvos* is for the men in one to become godfathers to children in the other, for this relationship is regarded as equivalent to actual kinship.⁴¹ Mohammedan law suppressed blood-revenge between believers.⁴² A transition from the private to the public system occurred among the early Scandinavians: a manslayer must pay, besides wergeld to the heir and kin, a fine to the king and hundred; this was to atone for breach of the public peace. The former was gradually left out and was abolished about 1335; then the fine went to the king, hundred, and avenger and, finally, to the state alone.⁴³

§182. Crime.

THE sense of responsibility and of effort, among the Melanesians, is communal and not individual; the system of morals, for instance, of the Koita of New Guinea, "does not teach or express individual effort and individual salvation, but on the contrary teaches the due subordination of the individual and his efforts in the sum of the tribal activities, which, broadly speaking, allow no room for individual initiative. Hence homicide and theft are not considered reprehensible in themselves, but only become so when directed against members of the community or tribe, or against outsiders strong enough to avenge themselves on the tribe." Because of their "non-individual system of morality," the author believes, this people has been but little influenced by the habits and beliefs of Europeans. "The moral disposition and system of the Koita not only suited their environment fifty years ago, but have been strong enough to bar the approach of some of the worst evils consequent on bringing civilisation to the natives of the Pacific." Where the southern Massim have come but little under white influence, "there still is nothing reprehensible about the sexual act so long as it did not entail adultery or take place between individuals who should keep apart on grounds of consanguinity or social custom; in fact, so long as these limitations were not infringed, a girl before she was married might dispose of her person as she pleased." This diminishes the category of sex-crimes and, as might be expected under these conditions, "rape or attempted rape is and always has been very rare. When it did occur the attempt whether successful or not, if made by an unmarried man on an unmarried woman, was not punished." In case of married people, the situation was quite different—undoubtedly on account of the element of property, that is,

40 Proksch, *Blutrache*, 18, 30 ff., 51 ff.

43 Geijer, *Svensk. Hist.*, 303.

of monopoly, in marriage—but “there is every reason to believe that the great majority of married women were, and are, faithful wives.”¹

In South Africa, “murder, theft, adultery, and incest are crimes against the Masarwa moral code, and are punished either by fines, expulsion from the tribe, or, in the case of the last two, by death, usually by retaliation on the part of the injured party.”² All sections of the Akikuyu seem to follow much the same rules in respect to sexual offenses, and “it is curious that whereas no difference is made between illicit intercourse with a married woman or a girl, there is a very much more severe penalty for causing a girl to become pregnant than in the case of a married woman. . . . Rape appears to be regarded as the same whether committed upon an unmarried girl or a wife, but the elders seem to require extremely little proof in the former case, for the fact that a girl complains is quite sufficient.” Primitive people do not often make a distinction between torts and crimes; in fact, crimes cannot be said to exist where the state has not taken over the punishment of what may be called public wrongs. The author quoted³ cites an illustration among the East Africans. “A woman while going to fetch some honey beer for a man fell down and hurt herself; the man was fined two goats as compensation by a large council of elders. Thus, where we should see no offence committed, the Mkamba often holds a man responsible for results which were in no way intended by him. The real explanation of this is, I think, that the native law does not regard offences so much from a point of view of the intentions of the offender as from results to the other party. The essence of all offences under our laws is the intention, but by civil law we can claim damages irrespective of this, and if therefore we regard all native law as civil, which in fact it is, we find that the difference is not so great. The distinction, however, which we make between criminal and civil law often confuses them and clashes with their ideas.”

Drunkenness and madness were no excuse for committing crimes in the region of the upper Congo. No one had the right to pardon except the injured person or family. “There was no distinction between premeditated and accidental homicide. Life had been taken, and it must be dealt with as murder. The family avenged all cases of assault on any of its members, no matter whether it was physical assault, abduction, rape, adultery, theft, or anything else. Retaliation in kind, when possible, was the essence of justice among the natives—an eye for an eye, a cut for a cut, a bump for a bump, and a life for a life. When retaliation was impossible, compensation by fines was enforced.” When a case was heard, deliberate effort was made to prejudice the court. “Before the proceedings began the plaintiff and defendant would each take their party of followers on one side, but in different parts of the town, and state tersely their case to them, and then distribute from 200 to 600 brass rods among them according to the importance of the case. It was their duty to clap their hands, and applaud every point made by the one who hired them, and to laugh ironically at the arguments of the other side. . . . There was a fiction that they were genuinely interested supporters of the side they took, but,” says Weeks,⁴ who reports the above, “I have often seen the rods distributed among them, and know for a fact that the majority did not care which side won. They always made sure of their rods before they shouted and clapped.”

⁴ In JAI, XXXIX, 433.

Criminal intent is something unknown to the natives of the Chin Hills: "Might quashes right and avarice smothers justice and custom among the Chins, whose quaint reasoning has decided that drunkenness is a valid excuse for murder and adultery, but that the action of a sober man committed by inadvertence and pure accident must be punished in the same manner as a crime committed with deliberate intent."⁵ It is characteristic of the hill-tribes of India to believe in the general honesty of mankind; "most of them are not civilized enough to be thieves."⁶ What in our law amounts only to indications and suppositions is regarded in the Malay law as proof positive. Marsden⁷ says: "If the stolen goods be found in the possession of a person who is not able to account satisfactorily how he came by them, he shall be deemed the guilty person. If a person attempting to seize a man in the act of thieving, shall get hold of any part of his clothes which are known, or his kris, this shall be deemed a sufficient token of the theft. If two witnesses can be found who saw the stolen goods in possession of a third person, such person shall be deemed guilty, unless he can account satisfactorily how he became possessed of the goods." Wilken⁸ adds that when a buffalo is stolen and the owner, following its trail, finds that it stops near an inhabited house, the owner of the house is required to get the buffalo back or to make good its value.

In the East Indies, as wrongs are generally regarded as committed against individuals rather than communities, justice has a prevaillingly private character. But there are regular punishments: stoning for adultery, maiming for theft. The talion has yielded, however, to composition in money and goods. In adultery and theft if persons are caught in the act, they may be killed; if not, there is a process and a fine. In general, retaliation is allowed within a certain period: a day, three days, a month, or, oftener, at once. If the evil-doer escapes to the prince, composition supersedes direct retaliation. Originally it was left to the injured to take life or atonement for life; but the limit indicated was later imposed. A fine is regarded as an indemnification rather than as a punishment. The fact that the crime is against the individual appears in the fact that if no plaintiff appears the case is dismissed. The law-books provide for no punishment if there is no charge. In cases of theft, one finds first if the thief is rich and then if he will repay; if he will, there is no process. A man's family may be held accountable for him. No account is taken of motive. For every killing wergeld is demanded, and it varies according to the sex, rank, and wealth of the parties. The payments for a slave, a female, a free man, a free woman, and a noble are in the proportion twenty, thirty, thirty, forty, and eighty. There is also a tariff on different parts of the body. For murder as well as theft the tribe is held accountable; if it does not pay, the offender is killed. The relatives of the victim can decide as to how the non-paying murderer shall die and may kill him themselves, with the same or another weapon. A murderer infrequently becomes a slave if he cannot pay. The thief or adulterer must reimburse, return the goods, or serve as a slave; in some tribes the adulterer must marry the woman and pay back her original purchase-price. Crimes against a chief, such as falsification of his commands, are punished by death.⁹

The chiefs do not appear to have had any magisterial jurisdiction in the Marquesas, nor does there seem to have been any other judicial tribunal. "Any

man receiving an injury from another, instead of making complaint to the chief, at once resorted to the prowess of his own arm and took a lawless retribution." Travellers who have commented on the absence of any legal provisions for the well-being and conservation of society, have added that nevertheless everything went on with the greatest smoothness, the people seeming to be governed by a sort of tacit common-sense. The power of the mores is here in evidence. According to the writer,¹⁰ in case of theft the injured man had the right to go to the house of the thief, if the latter were known, and to take back the article stolen, or, if it had disappeared, something amounting to two or three times its value, this being done without a word; but in case of theft from a chief, the chief might kill the thief. In Easter Island disputes were settled by the king or chief "without regard to law or justice; there was no code, and people avenged their own injuries." So, too, in other sections, there were no regular tribunals or systems of justice, the reason alleged being the power which the superiors had over the persons and property of their inferiors. "The right was always with the strongest, so tribunals were useless. If people of the same rank had differences, they arranged them amicably or fought; if they were chiefs, it meant war. It was not in the interest of the common people to quarrel, for they knew that the first chief who happened to come along would settle matters by appropriating to himself the object of litigation." Distinction was drawn between wrongs committed against group-members and those against outsiders: "In Niue, though the slaying of a potential enemy was a virtue, murder of a member of the tribe was punished by death. . . . Theft from a member of the tribe (but not from one of another tribe) was also regarded as a vice." How religion reinforces the mores is seen in a statement about a Micronesian group, that a man caught violating custom pays at once, but not so much from a sense of justice as from fear due to superstition, because anyone can avenge himself by his own gods or by purchased sorcery.¹¹

Theft is little known among the Tlinkits. "Before the fine art of thieving was introduced by the white man, no man's house was ever robbed, nor his wood stolen though cut and banked in the forest; his garden was not plundered, though miles from his home, nor his blankets thrown over his canoe to protect it from the sun disturbed, nor any of his belongings appropriated by another. Valuable articles are deposited in deadhouses and on and around graves, articles that natives covet, yet these were never stolen. . . . The percentage of thieving by natives is much lower than that of the white races. For more than twenty years we have lived among them. Our doors have been left unlocked for them to walk in and out; frequently we were out and they had the house all to themselves, yet in all these years we have never had anything stolen by one of them."¹² Nor was thieving common among the Omaha, where restitution was the only punishment. "Assaults were not frequent. When they occurred they were settled privately between the parties and their relatives. In all offenses the relatives stood as one. Each could be held responsible for the acts of another—a custom that sometimes worked injustice, but on the whole was conducive to social order."¹³ During the worst period of their demoralization the Pima Indians stole wheat from each other and sold it to buy whisky, but

"it is to be remembered that by far the greater part of the tribe disapproved of such deeds, and the few that engaged in such enterprises had not the support of public opinion, which even in an Indian village is an autocratic power."¹⁴ Incest, attempted suicide, and libel are no crimes among the Araucanians, "while robbery is part of the daily life of the Indian;" yet the latter applies only to the inter-group relation, for no stealing is allowed within the clan.¹⁵

Even murder was not yet a public crime among the Homeric Greeks; it was a private wrong against the murdered man and his family. The murderer withdrew from his country in order to escape vengeance, not legal prosecution or punishment in the strict sense. "The presence of a murderer then constituted no such pollution to the people of the land as it did in later times in Greece, and thus the act of killing in itself was no offense against either state or gods; just as, even to-day, among the Mainotes in southern Sparta, homicide is said to be regarded simply as a matter between man and man." Circumstances might, however, make homicide a dread offense against the gods, especially if the tie of kinship or guest-friendship existed between the slayer and the slain, that is, if it were in-group murder. "The Erinyes, or Furies, avenge wrongs to kindred, though they do not punish ordinary homicide. . . . The only court-scene which is depicted by the Homeric poet is between two men after a murder: one declares and the other denies that the 'ransom' or fine has been paid. No question arises as to the execution of the murderer, for which, indeed, the state had no provision." If homicide was a private offense, still more were all minor personal assaults matters of which the state as such took no cognizance. "Theft as well as murder was a purely personal cause, and each man had to protect the rights of himself and his family, although as in rude societies of the present day the neighbors of the injured party might be willing on their own account to aid in the punishment of one who might steal from them next."¹⁶

As among primitive peoples there are no binding precepts of conduct except those that rest on the principle of kinship, so among the Arabs the rule held good without substantial modification down to the time of Mohammed. "No life and no obligation was sacred unless it was brought within the charmed circle of the kindred blood."¹⁷ The Vendidad, which is the code of the religious, civil, and criminal laws of the ancient Iranians, is apparently the joint work of the high priests during the period of several centuries. They started with old sayings and laws (Avesta) and interpreted them in various, often contradictory, ways, until in the course of time these interpretations, the so-called Zend, became as authoritative as the original text. In the development of these rules of conduct, religion played an essential part.¹⁸ Further evidence of the nature of antisocial conduct will be given in the paragraph on the kinds of punishment meted out to offenders. It may be noted, as a general principle, that the category of crime is a variable; what constitutes wrongful behavior depends on time, place, and degree of economic and societal development.

Animals as Criminals. Says Train,¹⁹ in his chapter on animals in court: "The idea that animals should not be held responsible for their acts would have been

greeted with derision in ancient and mediæval times. Indeed by the law of England animals which caused the death of human beings were 'deadand,' forfeited to the crown, and either killed or sold for the benefit of the poor, as late as during the reign of Queen Victoria; while on the Continent animals were tried for their crimes, condemned and punished by mutilation, by hanging, or by being buried and burned alive until less than 200 years ago. The report of Berriat-Saint-Prix to the Royal Society gives a list of nearly 200 instances of the prosecution of animals between the beginning of the twelfth to the middle of the eighteenth centuries. Since he only cites the convictions, and as court archives of the Middle Ages are in large part lost or destroyed, and the cases imperfectly recorded at best, his list is probably a fragmentary one. The most interesting feature of this amazing docket is that no bug, bird, or beast was too small to be accused of crime and placed on trial for its offense; and the defendants include caterpillars, flies, locusts, leeches, snails, slugs, worms, weevils, rats, mice, moles, turtle-doves, pigs, bulls, cows, cocks, dogs, asses, mules, mares, and goats." Pigs appeared more frequently than any other animals at the bar of justice, probably because in mediæval times they ran wild and, in France, were so numerous and so dangerous that any one was free under the law in many places to kill them on sight. "The religious enthusiasts of the Middle Ages were ready to prosecute pigs and sows, not only on account of their habits and numbers but because they were always suspected of being possessed with devils. Many contemporary references exist to the Gadarene swine of the New Testament, which rushed down and cast themselves into the sea after having been so possessed. Indeed it was widely held and even taught by Thomas Aquinas, the greatest theological authority of mediæval times, that all beasts were but the embodiment of evil spirits. And more recently Père Bougeant, a French Jesuit, has sought to demonstrate the same theory in a philosophic thesis."

"Nowadays when animals are guilty of mischief, theft or violence we look not to them but to their owners for the purpose of fixing criminal responsibility, and if the owner can be shown to have used the animals as his instrument or agent, we visit upon him the retribution which a few centuries ago would have been inflicted upon the animal. Thus attacks by vicious dogs are sometimes made the basis for criminal indictments charging their owners with criminal assault." Yet survivals of the old notions remain, *e.g.*, the reported trial and conviction of a chimpanzee a few years ago before a police judge for the crime of publicly smoking a cigarette in violation of the laws of Indiana; and, more recently, the trial and conviction by a jury of a foxhound for killing sheep at Winchester, Kentucky; the execution of a dog in Winnipeg, in 1926, for biting a woman who was pulling his mistress's hair during a fight; and the sentencing of a hawk to death for murdering a pigeon in Chicago in 1927.

§183. Detection of Crime: The Ordeal.

THE detection of theft is an elaborate affair in New Britain. All the suspected persons may be got together and, after an incantation has been muttered by the priest-detective, they are each in turn made suddenly to strike out with the fist or suddenly to straighten out the arm, and he whose elbow joint gives out a cracking sound is the thief. "No protest can save him from the consequences or clear his character." Another method is for all the town or village

to gather in an open space and for the dealer in spirits to pass in front of them, his finger-tips to his lips and his elbow at right angles to his body and pointing to the people. Passing along the line, he mumbles his incantations, and suddenly his arm involuntarily, so it is said, straightens out in front of someone. That person is the thief. All believe the sign infallible; and the sooner the victim makes peace the better for himself. Should the detective pass all and no indication ensue, there is yet another plan. The priest enters the house from which the goods were stolen. "Standing in front of the place where the goods were usually kept, finger tips to mouth, elbow at right angles to body, muttering incantations, suddenly the arm straightens, and the direction in which the arm straightened is the direction in which the thief went."¹

The poison-ordeal, which is an institution characteristic of West African culture, is found among the Ba-Yaka. "Though death otherwise than by violence is recognised as 'natural' by the natives, certain cases, invariably where a chief is concerned, are referred to the malign influence of the evil spirit *Moloki*, acting through the agency of some old man or woman whom he is supposed to have possessed. The individual suspected is forthwith subjected to the poison ordeal. . . . If it causes vomiting on the part of the accused, he is considered innocent of the charge, but if the dose proves fatal, or if it has no effect, his guilt is regarded as established. In the last case a grave of a peculiar pattern is dug for him; he then sits down hard by and eats and drinks as much as he wishes, after which he enters the grave, usually of his own accord, and is buried alive."² Such is the power of religious belief. Poison-ordeals are practised by the Dualla,³ while on the Ivory Coast the ordeal, employed ostensibly to discover whether a death is natural or not, often issues in a mere exaction of fines.⁴ Farther toward the south, if a sorcerer charges anyone with causing a death the latter may call in a physician who mixes a poisonous dose of which the accused and the nearest relative of the deceased drink. He who is rendered delirious in the higher degree is condemned. If this is the accused, he pays or dies; if the relative, he pays an indemnity to the accused.⁵ Among the Loango Coast tribes when a wife has been accused of causing her husband's sickness by magic, and has been proved innocent by the poison-ordeal, she celebrates "a high festal day." This is natural enough, for it is reported that for every natural death an average of three or four persons die under ordeal. A prince whose wife died submitted to the ordeal, hoping to survive it and receive as indemnity all the property of his wealthy father-in-law; but he succumbed and his own possessions went to his accuser. Since the shaman may fix upon the amount of poison to be administered, and since he alone determines whether the brew is made from the poisonous or non-poisonous parts of the tree, men's fates lie largely in his hands. Ordeals are applied chiefly within the family, where envy and greed for property flourish, and where questions of inheritance periodically stir up trouble. When a person takes the draught, the bystanders are ready with uplifted weapons to cut him to pieces in case he does not vomit; but if one has successfully emerged from one ordeal he may not be accused of witchcraft again. It is to be noted that the ordeal is prepared for by fasting and purification; it is really a religious ceremony.⁶

In the Congo region "for petty thief-catching, a form of ordeal by fire is in great repute";⁷ but in more serious cases the poison-draught is administered.⁸ In some cases there is a sort of court which may condemn a man to punishment; but the condemned can have recourse to the poison-ordeal. He can be helped through this by friends if they will pay for the privilege of setting him a warm bath and exerting pressure on his stomach to force the dose up. This method is applicable to all sorts of crimes.⁹ If an article is stolen among the Bangala of the Upper Congo, "the owner walks through the town calling out a description of the thing stolen, and invoking on the thief all the fetish curses that come to his mind. These curses are so frightful as to intimidate the thief, and frequently the stolen article is secretly replaced. . . . If something valuable, such as a piece of cloth, or a large knife or axe is lost, and the owner has a suspicion that a certain man is the thief, he can accuse that man, and if the man denies the theft, his accuser can demand that he should drink the ordeal and so settle the matter definitely. To refuse to drink the ordeal is an admission of guilt. Should the test go against the accused, he will have to replace the stolen article, pay a fine, and all the expenses of the ordeal drinking. But should the test establish his innocence, the accuser will have to compensate the accused and himself pay the fees of those who gave the ordeal." Weeks,¹⁰ who reports this, gives an interesting account of the administering of an ordeal which he once witnessed: "At last it was decided that the parties should take the *nka* [ordeal-drug]. Each was so confident of the righteousness of his claims that he was willing and eager to eat a portion of the poisonous drug to support it. . . . Two *ngangas* prepared equal portions of the *nka*. There was about a dessert-spoonful in each portion. The accused had first choice, after which each doctor with the portion of *nka* in the palm of his hand took up his position by the side of his client, and at a given signal the portions of *nka* were simultaneously held to the mouth of the two opponents, and at the same moment they began to chew the drug. After chewing for a few moments each washed it down with gulps of sugar-cane wine. After taking the ordeal, the men are allowed neither to sit down nor to lean against anything, nor even to touch anything with their hands. The *nka* given in the above quantity blurs the vision, distorting and enlarging all objects, makes the legs tremble, the head giddy, and gives a choking sensation in the throat and chest. In fact it gives all the symptoms of intoxication and a few more besides. The one who first becomes intoxicated and falls down is the loser, and the one who resists the effects of the drug and controls himself the longest is the winner. . . . Forty minutes after taking the *nka* the climax came. The 'doctor' threw the stalk to the defendant (the accused), who caught it in his hands and carried it to the centre, where firmly fixing his feet on the ground, he stooped forward and placed the stalk with both his hands in a straight line, then raising himself he went back to his place. The plaintiff then went to pick it up, but no sooner did he lean forward than a spasm of pain seized him, and he would have fallen had not a man, who for the last twenty minutes had followed him closely, caught him in his arms and quickly carried him to his house. . . . The next day both accused and accuser were walking about the town, and seemed none the worse for drinking so powerful and dangerous a narcotic. They apparently

had no enmity towards each other, but chatted freely and laughingly over the events of the previous day. . . . By frequently drinking the *nka* one becomes immune from its effects, and I have noticed that old people, who had taken it many times, never fell intoxicated by it, but young people fell quickly, from its effects on their system. I have no doubt that the administrators of the various ordeals were open to bribery and other influences, and could and would dilute the ordeal for one in whom they were interested."

The Bongo utilized a sort of psychological system of detection. "Formerly, when anyone discovered that either his friend, or perhaps his brother or wife, had been killed and the criminal could not be detected, it was no unknown device to prepare beforehand an image carefully representing the murdered person, and very often the likeness would be singularly perfect. He would then invite all the men to a feast, at which the spirituous 'legye' would be freely circulated; and then, when excitement was highest, in the very midst of the singing and dancing, he would unexpectedly introduce the figure that had been prepared. The apparition would be sure to work its effect; the culprit would not fail to be betrayed, as he cowed and exhibited his wish to slink away. Having thus detected the offender, the injured party could deal with him as he pleased."¹¹ The wizard has many forms of divination of the general type described under that topic,¹² and presides over the boiling water and emetic ordeals. A hot iron is sometimes applied to the heel of the suspected thief, or is clasped by the woman suspected of adultery.¹³ If the Bageshu are not satisfied with the chief's decision, they appeal to the fire test. "They take a fowl to the medicine man who hears the case, he then heats an iron hoe and applies it to the leg of first one and then the other; the one who is burned is the guilty person. Should they both be burned, they are both considered equally guilty."¹⁴ In East Central Africa "an accused thief may, if the evidence be overwhelming, plead guilty, or he may demand the poison ordeal. If guilty, he trusts to his demand being resisted by the prosecutor; if innocent, he believes that he will unfailingly vomit the poison."¹⁵ In Uganda there is a clever form of detection that rests upon the physiological effects of fear. "Dry flour is given to the suspected person. If innocent, he can swallow it; if he is unable to moisten the flour with his saliva and swallow it, he is shown to be guilty."¹⁶ A religious theory is always infallible, for the spirits cannot fail; when the Nyassaland tribes are confronted with the dilemma that the lot has apparently fallen on an innocent man, they nevertheless say that he must have stolen the goods, for the lot could not lie.¹⁷

In the case of the poison-ordeal, the shaman always gets two goats and an iron digger; and for this reason the women and the poor cannot afford it. The cheaper way is to get the shaman to stick a needle or a pointed wire through one corner of the mouth of the accused. If blood flows thereafter in spitting, he is guilty.¹⁸ Again the sorcerer brings a magical twig and lays it before a suspected thief. If he can lift it to his shoulder, he is innocent. The belief is firm that no guilty man can lift it. "In consequence of this idea it probably comes about that the delinquent, caught under autosuggestion, cannot lift the twig, lets it lie, and confesses his guilt."¹⁹ In northeastern Africa the ordeal is

employed only in very severe cases; "only persons who under all the circumstances are given up as lost are subjected to the heavier ordeals." Ordeal by fire can be evaded by anyone through payment.²⁰ In Madagascar the ordeal consists in taking a stone out of boiling water without harm, or swimming a river full of crocodiles, or having water poured in the nose.²¹ In the last case, if the accused sneezes he is guilty; and in the first, if his hand is blistered. The water-test is called "the Creator's ordeal," and the swimming-test the "ordeal by crocodile." In the latter, if the accused survives unhurt, the accusers are fined four oxen, of which the swimmer gets two, the king one, and the councillors one. There is also a poison-ordeal along with which the accused swallows three small square-shaped pieces of fowl's skin. "Tepid water was after a few minutes administered to cause vomiting, and the proof of innocence was the rejection of these three pieces uninjured."²²

That able authority, Sir Charles Dundas,²³ has written so discerningly on this subject as applied to the Bantu tribes of East Africa, that he should be quoted at length. In this section discovery of the "truth" by ordeal, test, divining, witchcraft, and cursing is always the business of a medicine-man. Two examples of tests of veracity witnessed in Kikuyu may be cited: "1. Two men were strongly suspected of a theft of cattle. A medicine man was called in, and his performance was as follows: A common lizard was produced, and after being encircled by the doctor's gourds, was held to the nose of one of the men, who was asked if he was the thief. The man denied it and nothing occurred, but when the second man likewise denied his guilt, the lizard immediately bit him in the nostril. The medicine man pronounced the first man innocent and the second an accessory to the theft but not a principal. The same test was applied to two other men, and this time so soon as they denied their guilt the lizard bit the man's nostril and hung on. These were pronounced to be the actual thieves. I endeavoured, by close observation and experiment with several persons, to discover how the trick was done, but could find nothing to explain it; the medicine man would hold the lizard on his open palm, so that there was no possibility of squeezing or otherwise provoking it to bite. 2. Two men disputed for the possession of a wife. The one was required to go on all-fours on the ground. A small gourd was then placed on his back, and inside this a leaf, and on it two small bottles sewn in skin. The whole was covered with the man's blanket for a few moments, and on being uncovered the gourd was found about a quarter full of blood—said to be his own and proof of his false statement. Here also I could not find out, despite several repetitions, how the blood was conveyed into the gourd, where the medicine man had a supply of blood about his person, or how he had kept it from coagulating." The Wachaga use a liquid concoction called *Kimangano* which seems to have an intoxicating effect upon the accused, who is believed to confess his guilt under its influence. "As a matter of fact, I have ascertained that the person subjected to *Kimangano* does not speak entirely of his own accord, but the most leading questions are put to him and in his muddled state he is as likely as not to reply in the affirmative, which is taken to be clear proof of guilt. The custom has spread over the whole of Upare from Kilimanjaro." The commonest test or ordeal is perhaps the licking of hot iron. "I have seen this per-

20 Paulitschke, *Nordost-Afr.*, II, 150.

formed on more than one occasion, but I have never seen more than a slight scorching of the tongue result. I do not know how it is done in the other tribes, but in Ukamba it was performed as follows: A knife was thoroughly heated in a fire, but previously the medicine man dabbed and streaked a white powder on it. The same medicine was streaked on the man's forehead, nose, on the palms of his hands and on his tongue. The heated knife was then copiously licked with the tongue on both sides. I am told that the powder used was probably diatomite, and that diatomite is an excellent heat-insulator. Without some such protection a man could not possibly touch the knife without severely scorching his tongue, but I have seen it done without any visible results at all. The same powder is used by medicine men for many purposes; whether they know its true virtue in these cases I cannot say, but it is obvious that the medicine man can direct the issue of the ordeal by the quantity or evenness of smearing the powder on the knife and tongue as he pleases or accidentally applies it." Similar ordeals to this are the licking of hot coals and picking an axe-head out of boiling water. It is curious to note that in Sumbwa such ordeals have become converted into formal oaths: for instance, the accused will say, 'May I suffer the pain of boiling water if I did so and so,' but it is never put to the test and remains a mere formula."

The same author discusses oath-taking, saying that such oaths differ from ordeals in that they are not intended merely to betray the guilt of a man who will thereafter be dealt with; they signify, rather, that the matter is thenceforth beyond the sphere of human justice and that the guilt as well as its penalty is left to divine judgment. "The Kithito is an article endowed with mysterious powers whereby if a man swear falsely he will die in a given time. It varies very much in composition and effect; it may be a concoction of all sorts of odds and ends in which hyaena dung is very frequently found, or it may be simply an empty horn; it may kill the one who offends against it in a year, in a month, or in a few days; so also it may bring death to the offender alone or to his whole family; I am told that there are Kithitos which affect even the whole clan." Facing the Kithito, the person says what he maintains to be the truth; as he speaks he taps it with a twig and finally, tapping three times, he says, "Listen well, if I tell a lie let the Kithito eat me." "Upon this oath being taken nothing is decided in the case, for if the man dies the decision is thereby arrived at; if not, then nothing can be proved against him. Thus in the majority of cases the elders need give no decision excepting that the ordeal shall be undergone, or if one party refuse to do so he thereby admits himself to be in the wrong, and the case is decided." Oath by witnesses is rare; if administered, it is mostly a mere formula, such as stepping over a stick; or the witness submits to an ordeal. In all these ceremonies the person taking the oath should be naked. Among certain tribes the ordeal may be proved by proxy, either dogs or fowls or another person, preferably a slave, being subjected to ordeal on behalf of the accused.

Dundas believes the ordeals are more than mere trickery, for a medicine-man could not maintain a reputation for long on so flimsy a foundation. "The most successful method will always be that which works automatically, as, for instance, something which will make a man betray himself." All of these tests must be administered in the presence of the elders, and those which have been described as oaths and not ordeals are administered by the elders themselves. "These in particular bear the appearance of being religious practices, and they are said to be 'bad,' which always signifies that they are connected with

the spirits." A vast number of cases are disposed of by these methods among the more primitive tribes. "In fact, it is generally so when an accusation or claim is entirely disputed, for the judicial authority will not undertake to decide on evidence; indeed, it is more their duty to arbitrate than to decide, and therefore they are prone to leave decision to divine judgment." With all their crudity, these oaths and ordeals represent an effective adjustment to local conditions. As evidence of their adaptability a comparison may be made between their influence on native conduct and that of the European courts now established in the district. "The native is far too inclined to make claims of the most fanciful nature without any foundation. There being no necessity for caution in appealing to the European courts, the native takes advantage of this and regards them, I fear, very much as a convenient institution whereby he may obtain advantages which he could not get from his own tribunals. I have, in fact, heard natives make the most definite statements before magistrates such as they would not even repeat in the presence of the elders." So much for the evidence of Dundas.

The negroes carried their ordeals with them to the New World. In Surinam cases of death were always investigated with the idea of discovering the agent involved. The prepared draught was employed. "If the accused becomes sick, for instance, develops an eruption, hurts himself, gets a swelling, or talks in his sleep, it is regarded as the effect of the drink, and it is adjudged that the accusation is well founded. The consciousness of this danger in which the accused finds himself is for him of itself quite enough to undermine his health; always spied upon by his enemies, the smallest doubtful omission becomes fatal for him, and it is therefore not at all seldom that these accused negroes have shortened by voluntary death a life that had for them no further value."²⁴

In Tibet a feud is sometimes settled, when everyone is tired of it, by setting before two representatives, one from each of the warring tribes, two bowls of food, one of which is poisoned. "The tribe whose representative is killed is looked upon as the aggressor and is obliged to pay a heavy fine of cattle and other articles of value to the tribe whose claims have been sustained by the process of ordeal." Here the ordeal appears as a substitute for intertribal blood-vengeance; but the same expedient is employed within a group. "Should two women engage in a quarrel, an unnamable code requires that their respective husbands should take upon themselves the burden of dispute, the frequency of such sanguinary encounters giving just cause for wonderment as to why these continued decimations do not have the effect of soon depopulating the country."²⁵ India shows an ordeal to test chastity which consists of plucking cakes out of boiling oil and then husking a small quantity of rice.²⁶ Finger-mutilation was another test of chastity. The cut fingers of the chaste became quite well fifteen or twenty days after the operation, and were ever afterward a sign of chastity; for if their owner became unchaste, nails would grow on the stumps of the fingers. Those who were unchaste would surely suffer bodily ailment for attempting what only the chaste could do.²⁷ In the first "tradition-law" of Manu the ordeals are by fire, water, and the oath. If misfortune happen within a certain time to the one who has sworn, he is guilty. "This oath-test is also employed in the case of witnesses at court, perjury

being indicated by the subsequent misfortune." Then there were the balance-test and the floating-test. In the former "the man stands in one scale and is placed in equilibrium with a weight of stone in the other scale; he then gets out and prays, and gets in again. If the balance sinks, he is guilty; if it rises he is innocent." In the latter, "the accused is put into a sack and a stone is put into another sack. The two sacks are connected by a cord and flung into deep water. If the sack with the man sinks and the sack with the stone floats, the accused is declared to be innocent."²⁸ Water in which a holy person has washed is utilized in India to get the judgment of God.²⁹

"China supplies us with a curious form which is a combination of water ordeal and chance. If an injured husband surprises his wife, *flagrante delicto*, he is at liberty to slay the adulterous pair on the spot; but he must then cut off their heads and carry them to the nearest Magistrate before whom it is incumbent on him to prove his innocence and demonstrate the truth of his story. As external evidence is not often to be had in such cases, the usual mode of trial is to place the heads in a large tub of water, which is violently stirred. The heads, in revolving, naturally come together in the centre, when if they meet back to back, the victims are pronounced guiltless, and the husband is punished as a murderer; but if they meet face to face, the truth of his statement is accepted as demonstrated; he is gently bastinadoed to teach him that wives should be more closely watched, and is presented with a small sum of money wherewith to purchase another spouse."³⁰ The Ainos of Japan use the stone in hot water and also hot iron.³¹

Taking oath in the Indian Archipelago means that the person swearing utters a curse upon himself and represents it by one or another action. The Bataks cut off the head of a frog, the people of Nias that of a pig, and the Dyaks that of a black chicken, as a symbol of the lot one calls down upon himself if he is speaking falsely. The oath is generally laid upon the accused and is a sort of purification-device, a means of proving innocence. Before the court every dispute is viewed as a personal affair between the man who claims to have been injured in his rights and the alleged offender, and the affair must be fought out between the two of them. In this fight the oath is a weapon, with the accused having the first right to use it. "To the accused belongs the first chance to give evidence just as to-day in a duel the first blow or shot is the right of the challenged. Therefore it says in the law: *componat aut, si negaverit, juret* (let him settle, or, if he denies, let him swear)." This is the general rule among the Malays. They have also the usual varieties of the water- and the fire-ordeals, as well as the duel and various other forms.³² If court-procedure fails, the Alfurs of Buru resort to the ordeal: they wind the hand of the accused with a cloth and pour melted lead on it; if the lead injures the hand through the cloth, the accused is guilty.³³ Other ways of seeking the judgment of heaven are, in Borneo, by resting the case upon the outcome of a head-hunting expedition or a cock-fight; and in some cases the accuser and accused each provides a pig, the heads of the two animals being severed at a single blow, and the verdict going to him whose pig shows signs of life after that of his adversary has ceased to do so.³⁴ In Sumatra, besides variations on the water-

and fire-ordeals, there occurs that of rice or flour; the accused was required to swallow a mouthful of uncooked rice or raw flour. "If he choked or coughed over it, then he was guilty."³⁵ In the Philippines the red-hot iron and the pebble in boiling water offered a stock type of ordeal, and the rice-chewing variation was also found; in the latter case the party whose rice was most moist was the guilty one.³⁶

One Polynesian method of detecting a thief was to send for a sacred object from the temple—a coconut-shell drinking-cup, or conch-shell, or two stones—and each of the suspected parties, laying his hand upon the object, would pray that the god would look upon him and send swift destruction, if he had taken that which had been stolen. "Under this ordeal the truth was rarely concealed, as they firmly believed that it would be death to touch the sacred object and tell a lie; indeed any one who became ill soon after he had taken an oath, was regarded with suspicion." Cases are cited. The power of superstitious fear is further shown in the fact that, so implicitly did the people believe in the divine punishment or magical disaster that would befall a man who swore falsely on a sacred object, the oath of an alleged thief was considered evidence of guilt or innocence. In Tahiti, people who had been robbed and wished to discover the thief placed the matter in the hands of a priest, who, after praying to his god, caused a hole to be dug in the floor of the house and filled with water. "He then, holding a young plantain in his hand, stood over the hole, and again prayed to the god, who, if propitious, conducted the spirit of the thief to the house, and placed it over the water. The image of the spirit, supposed to resemble that of its owner, was thus reflected in the water, and identified by the priest, and the thief was discovered. Sometimes the priest failed in his first attempt, and postponed the operation until the next day; and as this adjournment became known by the people and came to the ears of the thief, the latter, in alarm at the prospect, usually returned the stolen property during the night, and so avoided further enquiry."³⁷ The fetish-preparation used as a means of securing the judgment of heaven, in the Tongan Islands, was the water in which the chief had washed his hands. The practice of swearing innocence prevailed here also. A man guilty of theft or any other crime was regarded as having broken the taboo and as being, in consequence, specially liable to be bitten by sharks; so a suspected person was required to go into water infested by sharks, and if bitten, was believed to have been guilty.³⁸ Aside from these cases, the ordeal was not very common in the Pacific; its existence in the island of Yap, as well as that of the duel and oath-taking, is denied.³⁹

Among the Wyandot Indians, "in procedure against crime, failure in formality is not considered a violation of the rights of the accused, but proof of his innocence. It is considered supernatural evidence that the charges are false."⁴⁰ The Dakotas have a chastity-test. "If a derogatory report is circulated in camp, the girl immediately gets up a 'Virgins' Lodge.' An old man is selected whose duty it is to arrange the tipi or lodge, in which the feast is to occur, by smoothing the ground two or three yards in diameter in the center of the lodge. A round stone is placed in the middle of the cleared space, and near it is

planted a knife, blade up. The crier goes through the camp, specifying the time and place of the feast. When all have assembled, the girl enters, places her hand on the point of the knife blade, typical of the god of war, that he may pierce her with this sharp blade if she be not pure; then on the stone, typical of the god of mountains, that he may crush her; then placing her head on the earth, typical of the god of the earth, that he may open the earth and engulf her if she be not truthful; she then takes her seat, her accuser is brought forward and goes through the same ceremony, and then openly accuses her; if his accusation is not substantiated, he is led from the lodge amid jeers and laughter from the spectators. After the trial comes the feast, and the girl goes forth with unblemished character. This feast excites a beneficial effect morally upon Indian women, and serves to make an extremely immoral nation very circumspect."⁴¹ In ancient Mexico, a man who had had property stolen assembled all the neighbors whom he suspected. "All must sit down on the ground and then comes the 'doctor,' as he is called here also, and takes the cover off a vessel in which he has a snake. It crawls out. If the thief is not among those present, it crawls back again into the vessel. But if it recognizes the thief, it creeps to him . . . and he is then seized and bound and confesses his guilt. It may be in this case that the consciousness of guilt caused the thief to move so that it gave the snake direction, or caused the sorcerer to direct the snake toward him."⁴² Among the Indians of Colombia, "the woman accused of adultery had to swallow a certain quantity of red pepper; if she confessed her fault she was pitilessly put to death; but if she could stand the ordeal, her husband had to make public apologies to her."⁴³ In Peru, if the accused denied guilt, he was tortured to obtain confession; but if he withstood they proceeded to the ordeal—though the accused had no part in it. It was left to the diviners who used all sorts of hocuspocus to get at the truth. "The result which they announced was regarded as unconditionally trustworthy."⁴⁴

Islam knows no civil law, says Ratzel;⁴⁵ the priest is in effect a judge and the mosque an asylum. Some traditional ante-Mohammedan methods prevail: a murderer is detected by putting red hot iron on the tongue, but there are said to be only two men in South Arabia competent to apply it. The ordeal of earth seems peculiar to the ancient Scandinavians: seated under a suspended festoon of grass, the accused took oath; if the grass parted, perjury stood proved.⁴⁶ The extensive use of the ordeal during the Middle Ages, culminating in the horrors of the Inquisition, is a matter of common knowledge.

§184. Punishments.

In Queensland, "the camp as a body, as a camp council, will take upon itself to mete out punishment in crimes of murder, incest, or the promiscuous use of fighting-implements within the precincts of the camping-ground: death, and probably the digging of his own grave, awaits the delinquent in the former case, while 'crippling,' generally with knives, constitutes the penalty for a violation of the latter. . . . In the case of a man killing his own gin [wife], he has to deliver up one of his own sisters for the late wife's friends to put to

death, he personally escaping punishment; but supposing an individual takes the life of another's gin, his own will be forfeited. On the other hand, a wife has always her 'brothers' to look after her interests. If two women fight, and one is killed, the survivor, unless, of course, proper cause be shown, would pay the death-penalty."¹

Among the Melanesians, "if a murder comes to pass within the tribe, according to strict regulations there must follow a fight of the relations of both parties—only they prefer to set the occasion goodnaturedly aside and compose it with dewarra [shell-money]. . . . About a hundred strings are regarded as sufficient compensation for a slain man, and fifty for a woman." This process of composition may lead to more bloodshed. In the case of theft, "if the man who is robbed is not strong or influential enough to punish the evil-doer, he destroys some part of the property of a man to whom he attributes influence and power enough to help him to his rights. The latter then seeks compensation, not from the destroyer of his property, but from the one who has injured the destroyer. If his power is sufficient, it is understandable that he does not content himself solely with a demand for the replacement of his own loss and that of the man who has appeared in so peculiar a way as plaintiff; on the contrary he will generally, along with it, do a good stroke of business in addition. In most cases the thief must work out his debt, together with rich interest, in the gardens of the one who accomplishes his punishment."² Theft does not seem to have been common formerly, and it is said among the southern Massim that stealing from the gardens is now much more frequent than in the old days when the practice prevailed of waiting for a thief in the garden and, if he were a stranger, killing him there and then. "If a man killed another man's pig the owner of the dead pig would generally kill the man whom he now regarded as his enemy. Generally the matter seems to have been discussed and settled without bloodshed, for in theory there was a certain license to kill another man's pig if it was destroying his crops. Thefts of nets, pots, and other moderately bulky portable property appear to be, and to have always been, rare, and when discovered the property stolen was returned or paid for in kind."³ A peculiar punishment in New Guinea is where, if a first-born son dies in childhood, "the event is looked upon as a fault of the father, who is then under obligation to give presents to the mother's brothers."⁴ In the D'Entrecasteaux Islands the usual penalty for an offense is the payment of a heavy fine. Club law is resorted to only when the evil-doers refuse to compound and the aggrieved party considers itself the stronger. "A man who carries off another's wife may be allowed to retain her peaceably if the husband is not strong enough to take vengeance. Shame would probably induce the abductor to pay some compensation, and his kinsmen would certainly feel disgraced if he did not"; so the right of the stronger is limited by public opinion. Even non-human things which have been accessory to a death are often punished: "In Mitaita a man was badly injured through falling out of a coco-nut palm, and the natives were waiting to see whether he would die or not before chopping down the tree. Near Wagifa, too, there was a palm in which deep notches had been scored because a man had once fallen from it and sustained serious injury; had he died the tree would have been cut down altogether."⁵

Burning alive is found but rarely in Melanesia—that is, as a civil punishment. In war-time a captured enemy who had roused great anger might be executed by fire; but “when peace had been made, and the chiefs had ordered all to behave well that the country might settle down in quiet, if any one committed such a crime as would break up the peace, such as adultery, they would tie him to a tree, heap firewood round him, and burn him alive, a proof to the opposite party of their detestation of his wickedness. This was not done coolly as a matter of course in the execution of a law, but as a horrible thing to do, and done for the horror of it.”⁶ In the New Hebrides, offenses were judged by the head men of the villages and the chief. Violators of tribal law were punished by having their hands tied behind them and being left to the public gaze for hours,⁷ a sort of pillory.

In South Africa the Marutse do not treat theft with severity, while the Damara punish cattle-stealing by death. Among the former, conspirators against the king were executed through the agency of the poisoned cup.⁸ In the upper Zambesi country testimony was heard on the side of plaintiff and defendant and, theft having been proved, “the accuser asked that they deliver to him the robber’s wife, being indemnified for the loss of several strings of beads, the object of the robbery, by the possession of the woman.”⁹ In West Africa “as a rule, murder, arson, and treason are punished with death. A first offence of theft is punished by flogging and a fine, a second by mutilation, and a third by death. When, however, cattle or sheep-stealing becomes prevalent, a detected thief is put to death, as a warning to others. In such a case, the criminal, instead of being executed by the Ogboni in secret, is decapitated on Ogun’s stool, by the sword-bearers of the chiefs, in some public place. Criminals who cannot pay their fines are flogged with . . . a formidable whip made of hippopotamus-hide, which draws blood at each stroke.”¹⁰ It will be noted that the severity of punishment increases here with the prevalence of crime. The penalty for violation of law is generally an eye for an eye and a tooth for a tooth; in some cases, if the penalties heaped up against a man are more than he can pay, he is condemned to death; but that ends the matter and his family is free.¹¹ Certain mitigations are known: a criminal among the Ewe-speaking peoples, if he addresses the king, must be spared. Often, therefore, criminals are gagged. If an Ashanti criminal swears on the king’s life he must be spared because his oath would involve danger to the king. In Dahomi, it is criminal to attempt suicide since every man, as well as all property, belongs to the king. A person whose house takes fire, even by accident, is put to death.¹²

One of the African penalties for theft, and also for abduction or infidelity, is the cutting off of parts of the body. Nose, ears, and even lips are mutilated, but the fingers suffer most. “Men generally pay for it with the three sections of all the fingers, while the woman in question often gets off with the loss of the finger-tips.”¹³ In a few cases intentional homicide is distinguished from accidental, the former calling for the death-penalty, the latter for a fine in cattle. The cattle are eaten at a big feast, the murderer being smeared with their blood but getting none of the meat.¹⁴ “As a rule, along the Coast the death penalty for murder or adultery is commuted to a fine, or you can send a substi-

tute to be killed for you if you are rich. This is frequently done, because it is cheaper, if one has a seedy slave, to give him to be killed than to pay the fine, which is often enormous."¹⁵

On the lower Congo, "in any dealings with the natives, if a European suffer aggression, and can clearly prove that such is the case, he is certainly adjudged to be in the right, and the offender condemned to a penalty which is assessed by the natives and the European: and further, if a chief promise that such and such a fine shall be paid, his word is in all cases sufficient. I have never known an instance where this statement fails, and the fact is the more remarkable as the chiefs present are not one whit better than the culprit, nor are the other natives who join in condemning him."¹⁶ On the upper Congo, its own punishment or fine was attached to each crime. Adultery was fined from one hundred to three hundred brass rods, equal to from three to nine months' ordinary wages.¹⁷ Among the Ba-Huana, "all crimes against the person, even of chiefs, and fetishes are punished by fines; adultery and rape are considered personal injuries to the husband or father, and compensation is assessed by the chief; murder, which may be compensated, is not considered disgraceful; on the other hand, a murderer is respected as a clever and brave man; this idea is carried to such lengths that a man who has murdered his brother, to whom he is heir, is not fined at all."¹⁸ In British Central Africa, punishments for all offenses amounted practically to payment; in case of homicide, after compensation was paid, the murderer and his people were invited to drink and the affair was closed, no enmity being harbored.¹⁹ In Uganda theft is severely punished: "The thief is fined a large number of sheep and goats, and if he cannot pay he is beaten to death with clubs. If he is able to pay the fine, however, he must still receive a severe whipping; and this often leaves him mortally injured. Among the Kamasia not only a murderer, but all his relations, suffer confiscation of their entire stock of cattle, sheep, and goats." By some tribes, murder is considered a capital offense and the culprit is immediately executed with spears by the warriors of the tribe; by others it may be atoned for by a heavy fine.²⁰ The convicted murderer among the Baganda is speared or clubbed to death and the body is burned at the crossing of two roads; the property of the murderer is always confiscated and goes to the relatives of the deceased and to his clan.²¹ According to Dinka laws all bodily injuries are compensated by cattle; refusal to pay is likely to result in deliberate damage to the offender or his family in retaliation. Theft is very rare; when it occurs, the stolen article or a similar one, at least as good, must be returned.²² The murder of a free Galla by a Galla can be atoned for by a thousand cattle—in the case of a woman by fifty; but this figure is generally reduced in practice. Though the Somals generally have but two penalties, death or money-payment, here and there are to be encountered both mutilation and outlawry. The ears may be notched as a sign of crime, and some persons show three notches.²³

On this topic of punishments, as on many others, available information from East Africa is so pertinent as to deserve considerable space. With the exception of acts of blood-revenge and similar forms of homicide, an actual death-

penalty is rarely inflicted among the Bantu, occurring almost solely in tribes with despotic chiefs. Among the Wapare, for instance, robbers were put to death at times and in districts in which there happened to be powerful chiefs who appreciated the advantages of ordered conditions. Another crime which frequently involved capital punishment was treason, the traitor being equivalent to an enemy and therefore without rights. "These examples of death penalties," comments Sir Charles Dundas,²⁴ "are the exception to the prevailing rule among the Bantu that a man's life could not be forfeited by his acts; they are not general among the tribes, and I doubt if they are commonly applied in any tribe. But there was one crime which invariably was punished with death, namely, witchcraft. Curiously enough, among tribes which I know personally I have always found that no other penalty than death is known for this crime: it is not compensated as murder, and if the detected wizard is not actually killed he is at least required to take an oath or submit to an ordeal which is believed to cause his or her death in the end. But I do not know of a tribe with whom witchcraft is not punishable by death."

The writer, who was a colonial administrator, shrewdly urges that the native customs, as representing tested adjustments, be disturbed as little as possible. "It is often argued that we must strive to impress upon the native a higher value for human life; but on the one hand he evidently esteems it most highly, and on the other hand our methods may often tend to cheapen life, either by killing the culprit, where such was not justifiable under native law, or by allowing him to be at large when his life was forfeited under the same law, as well as by disregarding and superseding the religious aspects of the crime. It is not easy to say exactly what changes are to be recommended in our present system, but briefly, our main object should be to give the utmost consideration to the native view of each particular case." The native is, in fact, not often guilty of murder, as we commonly understand the term; "of premeditated murder I have only known two cases, but ninety per cent. of the cases of people being killed may be said to be due to drunken brawls, and invariably these arise between persons whose youth would, under the old custom, have prevented them from drinking intoxicating liquors." Native law, we are told, has two apparently weak points which, however, before conditions changed, constituted no weakness but an expedient adjustment. "The first is that it is too lenient. For instance, the punishment for murder is inadequate, because either a man is rich and will not feel the loss of fifteen head of cattle, or if he is poor he will beg the stock from his clan. Of course the law is as it was required to be. The Mkamba is neither grasping, cruel, nor hot tempered, thefts are pretty rare, and murders are nearly all committed in drunken broils. Again, in former times when people lived more isolated, they had not much chance of offending against each other, or if they did, litigation would mostly be a useless means to redress. Thus the law did not need to be harsher than it is. The second weak point is that the law lacked authority, where it failed would be when a man refused to submit to all authority; and then no one could enforce it excepting by *kingolle* [any form of punishment by competent authority], and then indeed it became a very powerful authority that he had defied. . . . It was only on persons who repeatedly offended that *kingolle* was inflicted, and

²⁴ In JAI, XLIII, 518 (quoted); in JAI, XLV, 258, 263 (quoted), 267, 268, note, 271-272, 273 (quoted), 274, 275-276 (quoted); in

JAI, LI, 232-233 (quoted), 241-242, 244 (quoted), 247; Dundas, K. R., in JAI, XLIII, 52-53; Hopley, *A-Kamba*, 78.

when it amounted to a sentence of death this implied that the offender had become so incorrigible that he was regarded as a danger to the public."

A good example is the habitual thief. Here again is evidence of the fact that native customs, no matter how strange they may seem to us, are common-sense procedures under the conditions to which they are adjusted. "The offence of theft would formerly be most commonly restricted to the taking of stock, and this is the only form of provocation known to me which is admitted. Both in Ukamba and Kikuyu a man was entitled to kill a thief caught in the act of taking stock, without being liable for compensation. . . . A man who frequently stole stock would in the end be put to death by public consent, and the same fate awaited the one who stole honey or hives. Hives being placed in trees in uninhabited country, often several days' journey from the owner's village, it is natural that very severe penalties were required to protect the owners. . . . The penalty for stealing stock in Kikuyu was otherwise ten times the value of whatever was taken, besides three sheep for the elders, and this penalty was imposed on every person taking part in the theft. . . . Thefts from members of one tribe or section of a tribe are uncommon, and the offence is, comparatively speaking, severely dealt with. Above all it is recognised as provocation which may be a justification for causing death. It should be noted here that theft is the only offence in which we may speak of a fine being imposed, for, although the offence is amended by restoration of the property, over and above there is a payment due which far exceeds the value of that taken. Nevertheless this payment is made to the aggrieved party, and not to the public authority, so that the advancement of this crime to a matter of punishment, and not mere compensation, has still left it in the light of a private matter. It is a wrong done to the individual and not to the community. The name of thief carries a peculiar stigma with it, and while almost every other offence is attributed to circumstances rather than to character, that of theft signifies to the natives an unpardonable nature. Indeed, whereas they consider that in general we deal too harshly with crime, I have often heard them regret that we are too lenient with thieves: the following uncomplimentary observation was overheard on one occasion, "The Government has come to help thieves and wizards."

The author goes on to consider the subject of compensation or blood-money. From the schedules which he gives it appears that this is not reckoned haphazard, but on a definite basis. "Some elders, being asked once what compensation a man should pay for causing the loss of both legs to another, replied that they had never heard of such a case, but since a man who had lost both legs would not be regarded as a man at all, full blood-money should be paid. Blood-money is perhaps the basis of all compensations for bodily injuries, but how other offences were determined at their present amounts we cannot say; they are, however, all representative of the degree of gravity attached to them, and incidentally also of the general wealth of the tribe." From the lists of compensation for hurts it appears that the loss of a leg, for instance, is reckoned at about one-third of full blood-money, and if a man has received such compensation it is deducted from the blood-money due should he be subsequently killed. The underlying idea here seems to be that not more than the value of a man's life may ever be paid for his person. No deduction is made if the individual killed has been crippled or deformed from birth. "The Akamba are good surgeons and skilfully sew up wounds with thorns. The amount of compensation for wounds not otherwise provided for is then reckoned by the number of

thorns required to sew up the wound; each thorn is reckoned as one goat, to which is added another goat for slaughtering, and a third for the suffering in the event of many 'stitches' being required." A man who kills his own wife is not required to pay compensation in Ukamba, Kikuyu, and Theraka, but he is still liable for any balance of dowry unpaid at the time; in Unyamwesi, however, the husband who kills his wife may be put to death by her relatives or compelled to pay full blood-money. Compensation for the death of a woman is much less than that for the murder of a man. A transitional case toward fine in the legal sense, a penalty accruing solely to the state, is seen where, when a fine of several head of cattle is inflicted, the bull as a general rule goes to the chief; when the fine consists of a bull only, the hump or ribs, as the case may be, is claimed by him.

In ancient times the Yakuts practised torture upon the guilty.²⁵ In Kamchatka the murderer is demanded and exactly the same treatment accorded him as to his victim.²⁶ As wood is extremely scarce and expensive in Dagistan, one of the most terrible punishments for crime is to tear down some rooms in a man's house; it will take him years to save enough to replace the floors, ceilings, and other parts destroyed.²⁷ The responsibility for payment of blood-money among the Gilyak rests with the clan as a whole; delivery is accompanied by a complicated ritual which includes an imitation of blood-vengeance: two champions, one from each clan, advance between the two parties to the dispute, bearing shields. They engage in a combat, which is usually merely a feigned one, though it sometimes develops into a real fight.²⁸ Among the Nagas of India the means for the prevention of crime "fall into two divisions, those offences liable to immediate punishment by the hand of the aggrieved persons; and those adjudged by a council of elders. Murder comes within the first category; 'the relations of the murdered person instantly, if possible, spear the murderer without reference to the council of elders.' In case of infringement of the marriage law, the injured husband speared the offender 'on the first opportunity,' it may be inferred without reference to any council. Thefts and other petty offences on the other hand were disposed of by the elders, who imposed a fine and restoration of the property or its equivalent."²⁹ In southern India, "if a difference arose between two people a meeting of the principal men of the thirty thousand was convened, and they sometimes decreed that the plantain trees, betel vines, betel-nut and cocoanut trees in the garden of the guilty person should be cut down, other plants destroyed with a sword, and his house unroofed."³⁰ Fines varied according to the caste of the thief, increasing, in Manu's time, in proportion to the dignity of the culprit.³¹ In China the law inflicts a sort of civil death, forbidding certain offenders to offer sacrifices to their ancestors, and, under a penalty of flogging, to mourn for their dead relatives.³² The Ainos club wrong-doers. "Their punishments are severe, but they do not take life, even for the crime of murder. The murderer is bound to a cross for a week, and, after his release, receives some good advice from the judge, when he again takes his place as an honorable citizen. The clubs are used for punishing thefts and other crimes." A murderer once had his nose and ears cut off, or the tendons of his feet severed. "These cruel

punishments are undoubtedly old practices no longer in vogue.”³³ An anomalous case among these people is where a thief discovered by oracle is not tried, but the person robbed waits patiently for him to bring back the stolen property and ask forgiveness. In Japan banishment was a severe penalty. “We can scarcely imagine to-day the conditions of such banishment: to find a Western parallel we must go back to ancient Greek and Roman times long preceding the Empire. Banishment then signified religious excommunication, and practically expulsion from all civilized society. . . . Common folk were punished by cruel whippings for the most trifling offences. For serious offences, death by torture was an ordinary penalty; and there were extraordinary penalties as savage, or almost as savage, as those established during our own medieval period,—burnings and crucifixions and quarterings and boiling alive in oil.”³⁴

Among Malay groups on a low stage of civilization, offenses other than theft very seldom occur, and when they do, the injured party himself determines, if the guilty one is discovered, the amount of compensation. Only in those instances where the payment is refused in part or as a whole, does the case come before the chief.³⁵ In Sumatra, “if a man surprises his wife in the act of adultery, he may put both man and woman to death upon the spot. . . . If the husband spares the offender, or has only information of the fact from other persons, he may not afterwards kill him, but has his remedy at law, the fine for adultery being fifty dollars.”³⁶ In the Philippines the relations themselves generally punished the offender; composition was allowed except in case of murder, to which the law of talion applied. The whole people might attack the district of the murderer, with bloodshed and enslavement as a result.³⁷

In some of the Polynesian islands there seems to have been little or no organized system of justice, especially as regards offenses committed against persons not belonging to the aristocracy, the general bulk of the people being left to fight out their own quarrels. “Acts of oppression or cruelty by the head of a family, or haughty conduct of a chief, could not be punished; the only remedy for the oppressed person was to go away and live with another branch of the family. On the other hand, offences against other villages were often visited with very severe punishment, because they might lead to war. There is an example of a youth who stole a canoe belonging to a man of another village, and who was found out. The heads of families of his village therefore bound him in the usual way, like a pig intended for killing and eating, carried him to the other village, and deposited him as a symbolic sacrifice in the *malae* [council-house] there; and by this act of deep humiliation they appeased the anger which had been caused.” While in Samoa punishment for an offense was to a large extent left to the injured person or persons, there existed also judicial punishment, in that the head of the family had some jurisdiction within his own kin-group and was in a way its official magistrate. As the various heads of families composed, with the chiefs, the assembly or *fono*, they also adjudged punishment to public offenders. The methods of punishment were divided into two classes, namely *o le sala*, destruction of houses, live stock and plantations, with, at times, the seizure of personal property and banishment, and *o le tua*, or personal punishment. The first type was usually inflicted by the whole available force of the district awarding it, that is, by the

fono. It was, at times, imposed by one family upon another, if the injured group was strong enough to do so; on occasion it was the penalty for insulting a chief. The infliction of the death-penalty seems to have followed especially upon murder and grave political crimes. Minor offenses such as theft, insulting travelling parties, preparing pitfalls, and taking the comb out of a married woman's head were also the subjects of punishments, inflicted by the *fono*, and carried out, immediately after sentence had been pronounced, in the presence of the whole assembly. These different forms of punishment have become mostly obsolete, and fines of pigs and other property have taken their places. Various types of punishment are found in the Polynesian group. In Bow Island murderers were killed and eaten; in Niue the natives often got rid of a thief by sending him adrift in a small canoe, so that he perished at sea; in Fakaofu punishments were generally milder, the offender being set to make a certain length of rope or a number of fish-hooks for the king, though death by strangling was sometimes inflicted for stealing food in time of scarcity. On Easter Island thieves caught in the act might be beaten and knocked about, and were allowed to offer no resistance. The injured party, "in the event of the full value not being recovered, . . . could destroy the property of the offender to equalize the amount. Retaliation for theft could thus be enforced by the weak against the strong, and any resistance would call the entire community to the aid of the former."³⁸

In consonance with their peaceable disposition, the Greenlanders have a mild way of settling disputes. The judicial procedure consists in pitting the litigants against one another in the midst of a circle of onlookers; each beats a drum and sings satirical songs about the other, telling his misdeeds and making him ridiculous. The one who succeeds best at this wins his case. This may seem very trivial to us, but the Eskimo has an extreme dread of being made ridiculous. The missionaries have put down this custom, which was called the drum-dance, saying that it leads to immorality; no form of justice now exists.³⁹ In the accepted sense of the term, there is no such thing as government among the Tlinkits of Alaska. "They have no courts, no jails, police nor statutory laws; in short, nothing corresponding to civilized government. They have no such thing as trials. All grievances, offences and injuries are settled according to tribal demand. The tribe or clan takes up its member's cause, and settlements are made according to the nature of the offence, or injury, and the standing of the injured. The tribe of the injured party determines the amount necessary to settlement." Any crime may be paid for on a money basis, but while they usually demand life for life, it is not necessarily the life of the murderer. "If a high-caste native kills one of a lower caste, it is not the one who did the killing that is taken, but one equal in station to the one killed. The same holds good if one of a lower caste kills one of a higher. If one higher than the one killed is taken, then the killing has to go on until it is considered equal. If a woman kills a man, not the woman, but some man of her tribe must be taken, as a woman is not considered the equal of a man. If a man kills a woman, not the murderer, but some woman of his tribe is taken. If a white man kills a native, the murdered man's friends are not particular as to what white man they kill in turn, so they get one whom they deem of equal station. . . . Accidental in-

juries, or killing in self-defence, must be atoned for precisely the same as if premeditated."⁴⁰

Among the Indians, theft inside the tribe was rare and, when committed, the tribal authorities demanded restitution. The loss of the property taken, flogging, and a degree of social ostracism constituted the punishment of the thief. Instances could be multiplied to show the security of personal effects in a tribe.⁴¹ As in the case of the Eskimo and others, slighter delinquencies may be left to family authority for punishment, while flagrant and repeated crimes are taken cognizance of by the council. "Treason consists in revealing the secrets of the medicine preparations or giving other information or assistance to enemies of the tribe and is punished by death. The trial is before the council of the tribe."⁴² The Sioux have a sort of police force: "punishments by law, administered by the 'soldier-band,' are only for serious offenses against the regulations of the camp. He who simply violates social customs in the tribe often subjects himself to no worse punishment than an occasional sneer or taunting remark; but for grave transgressions he may lose the regard of his friends."⁴³ Here are grades of punishment, severe in proportion as they threaten the interests of the group. Among the Omahas, "when the life of a murderer was spared, he was obliged to submit to punishment from two to four years. He must walk barefoot. He could eat no warm food; he could not raise his voice; nor could he look around. He was compelled to put his robe around him, and to have it tied at the neck, even in warm weather; he could not let it hang loosely or fly open. He could not move his hands about, but was obliged to keep them close to his body. He could not comb his hair; and it must not be blown about by the wind. He was obliged to pitch his tent about a quarter of a mile from the rest of the tribe when they were going on the hunt, lest the ghost of his victim should raise a high wind, which might cause damage. No one wished to eat with him, for they said, 'If we eat with him whom Wakanda hates, for his crime, Wakanda will hate us.' Sometimes he wandered at night, crying and lamenting his offense. At the end of the designated period, the kindred of the murdered man heard his crying and said, 'It is enough. Begone and walk among the crowd. Put on moccasins and wear a good robe.'⁴⁴ Running off with a man's wife or committing adultery was treated with severity. "In this class of offenses the husband or his near relatives administered punishment. The woman might be whipped, but the heavy punishment fell on the guilty man. Generally his property was taken from him, and if the man offered resistance he was either slashed with a knife or beaten with a bludgeon."⁴⁵ Among the Cree, "if a man murdered his wife through jealousy, as sometimes happened, he had to pay eight horses to his wife's relatives, or, if he could not afford this, he might flee alone on the warpath, kill one of the foe, and return to paint the faces of his parents-in-law with charcoal. They might then spare him. Eight horses, or an enemy's scalp, constituted the usual blood-money demanded by the parents of any murdered person."⁴⁶ Among the Hopi there seems to be no punishment for crime except sorcery, to which, under Hopi law, all transgressions may be reduced.⁴⁷ The delinquency among the Gulf tribes is assessed more or less, according to his neglect of his duties, by the proper

officers—a duty which the latter “strictly fulfill without the least interruption or exemption of any able person.”⁴⁸

There has been some change in the mores along the northwest coast. “When first visited by the early voyagers these Indians, like all others on the coast, were bold, arrant thieves. With them it was not dishonorable to steal, and, if caught, restitution settled the matter. On the other hand, they discriminated, and seldom or never stole from a guest, and never robbed one of their own totem. With them, to-day, an unwatched camp or an unlocked house is sacredly respected, and the most valuable property cached in the woods, as is the Indian custom, is as safe from other Indians as if guarded night and day.”⁴⁹ Farther south, “murder is generally compounded for by the payment of shell money . . . no crime is known for which the malefactor cannot atone with money.”⁵⁰ Among the tribes of Mexico, the restitution of a stolen object atoned for the theft; failing this, the thief became a slave for life. “Old men of more than seventy were alone allowed to get drunk; a drunkard younger than this had his head shaved, and if he held any office he was publicly degraded. . . . Corporal punishment was rare. It was considered shameful even for a slave to be chastised.”⁵¹ A young noble might be strangled for drunkenness, while an older lost rank and goods.⁵² The San Domingo Indians impaled a thief.⁵³ In northern Nicaragua most crimes can be atoned for by money and no ill feeling remain; but “murder must be expiated by the suicide of the murderer, and if he wants to run away he is killed by a relative of the slain.”⁵⁴ A thief was sometimes suspended by the hands from a branch and vituperated by the women; in one case the victim was pale and seemed to be near losing his senses. It was said that he had stolen some animals and would hang there till he told where they were. The Incas, Caribs, Araucanians, and others punished theft inside the tribe with death.⁵⁵

In the ancient world execution by burning was applied only when some religious abomination was included in the crime or when it was politically outrageous. In the laws of Hammurabi an hierodule who opened a dramshop or entered one to get a drink was to be burned. A man who committed incest with his mother was to meet the same punishment, also one who married a mother and her daughter at the same time. Other typical punishments for different offenses were enslavement and the loss of hands.⁵⁶ Among the ancient Hebrews, if a man marries both a mother and her daughter, all are to be burned, and the daughter of a priest, if she becomes a harlot, is to be similarly punished.⁵⁷ In the old Norse laws, honorlessness meant civil death, the term being applied to such cowardly or despised acts as killing in a place under a peace-taboo; slaying a sleeping or a defenseless man, or one's house-master, or him with whom one shares meat and drink, or a woman; or fighting against one's fatherland.⁵⁸ Under the theory that severe penalties intimidate and deter, capital punishment accompanied by torture and accomplished in numerous excruciating ways was the penalty inflicted for many offenses during the

Middle Ages and early modern times.⁵⁹ In recent days it has come to be suspected that the element of deterrence inheres less, perhaps, in the severity of the penalty than in the certainty and promptness of its imposition.

§199. Primitive Accuracies and Fallacies.

THE savage usually shows considerable adaptability in the practical affairs of the struggle for existence. Semon¹ finds the intellect and senses of the Australian brilliantly developed in all directions bearing on the hunt; he displays an excessively sharp power of observation, topographic sense and memory, and a particular faculty of drawing conclusions from the smallest signs and traces as to the whereabouts and the actual state of the game. All this, combined with great dexterity in the use of weapons, makes Australian game the helpless prey of these perfect huntsmen. Therefore he thinks it is a great error to represent the Australians as a half-starved miserable race struggling for life under the hardest conditions. The aptitude of the natives is further shown in their successful search for water in the arid regions and during the dry seasons. A curious discovery of the blacks, and one which shows how minute have been their food researches, is that some sorts of trees which grow in the most arid wastes contain water in their lateral roots, which lie just below the surface of the ground. "These, when pressed for water in such country, they partly grub and partly tear up, cut into pieces eight inches long, and stand upright in their wooden calabashes, into which the water slowly drains from them. By this means an experienced man may soon obtain a pint or two of pure, cool and tasteless water."² Another method of getting water from trees is seen in the case of a certain variety which, when the trunk attains a diameter of about six inches, becomes pipe-like, thus forming a natural reservoir in which the rains of the wet season are collected; the branches of the tree, which join at the top of the stem, act as conducting-pipes. "The narrow aperture prevents much evaporation, and the natives know how to obtain water here, where an inexperienced traveller would never dream of searching for it. To procure this water, the native ties a bunch of grass to the end of his spear, and then climbing the tree, dips his primitive piston-rod—if I may so call it—into this singular well. Drawing it up again, he squeezes the water from the grass into his bark dish, and thus proceeds until he obtains sufficient for his present requirements." The bottle-tree of northern Australia also furnishes a refreshing beverage. The natives cut holes in the soft trunk, where the water lodges and rots the trunk to its center. "These trunks are so many artificial reservoirs of water. When a tree has been cut, its resources are not exhausted. The tired hunter, when he sees a tree that has been tapped, cuts a hole somewhat lower than the old cuts, and obtains an abundant supply of the sweet mucilaginous substance afforded by this plant." The natives are also acquainted with the fact that the bladder of the frog acts as a reservoir for water and occasionally they kill these reptiles for water as well as for food.³

In their battle with nature the African Bushmen are extraordinarily sharp and keen, as they need to be, for their habitat is one of the poorest on the

globe.⁴ The Bawenda of South Africa "are more at home on the surface of the earth than in the heavens and in the air. There is not a single geographical fact of their country but they have given it a name of their own. Even geological features have not evaded their notice, for they have specific names for every kind of soil and also for every sort of stone and rock. Botany is the great field of the medicine doctor, for he knows all the poisonous plants, but besides that there is not a tree, shrub or plant that has not a name in their language. They distinguish even every kind of grass by a different name. The Bawenda have names of their own for any living creature found in their country."⁵ This first-hand acquaintance with nature is acquired early in the school of experience. On the Upper Congo, "lads accompany their fathers and elders on their fishing and hunting expeditions, and learn by imitation, by listening to the talk around the camp fire, and by instruction. Most lads of fourteen to sixteen know the names of the fish in their river and creeks (and there are quite three hundred kinds of fish), their habits, and the best mode of catching them. They also know the names and habitat of most bush animals either by experience or repute; the names of birds, insects, trees, plants, etc., are all well known to them and easily distinguished. Boys and girls of a tender age will know all about sexual intercourse, pregnancy, and child-birth. In these matters they are very precocious."⁶ In general, where the African native shines is in his home, the bush. "He can generally beat the white man in bushcraft, endurance under the trying conditions of a tropical climate, and at going through thick country he is often wonderful. To show himself at his best, however, he must be in his own locality; if he is transplanted, even a short distance, he deteriorates. The white man, who is a keen hunter, is generally much more in touch with the native and in sympathy with him than the one who does not care for sport. It is easy to see why this should be so. The latter meets the native over matters of discipline, taxes, labour, and many other things which are of the white man's invention and making, and so difficult for the native to understand. The hunter meets the savage on common grounds and on matters with which the latter is, in a primitive way, more conversant than he himself is."⁷

"Native experience of wild animals and their ways is far more extensive and thorough than ours, and, as a rule, they behave, in an emergency brought about by an encounter with wild animals, in a perfectly rational manner, based on a knowledge of that particular animal's habits. They will run away from a rhino and jump aside, well aware that its impetus will carry it past. But they know better than to run away from elephants. I have seen natives, under a charge of these, lie down and remain motionless on the ground, knowing that the short-sighted giants would mistake them for logs and step over them. . . . Besides their facility in learning new languages, negroes also have a remarkable gift for communicating with each other by signs. I have often been astounded to notice how all the inhabitants of a village, including the children, were able to converse fluently with a deaf-mute. A few signs with the lips and the fingers were sufficient to convey the meaning of a long sentence, and the mute did not seem to be in the least inconvenienced by his inability to enunciate words."⁸

In everything that pertains to daily life, trade, agriculture, and other prac-

tical affairs the Dyaks often show keen judgment.⁹ A Philippine Islander once boasted to Worcester¹⁰ that, given a machete and a clump of bamboo, he could provide a good dinner. When the writer laughed at him, he walked to the nearest clump of bamboo, split a dry joint and kindled a fire, put water on to boil in a green joint, stewed some fresh young bamboo shoots in it, and then fashioned a platter to hold the "greens" and a knife and fork with which to eat them. The Shingu Indians display great powers of adaptation in matters of self-maintenance. Although living upon the product of the ground, they were obliged to continue hunting because of the raw material for implements which they got from the fish and animals. "They used the jaw with the teeth of a fish called the piranya, as a cutting instrument, especially for cutting all cords and fibers. The arm and leg bones of apes are used as arrow points. The tail spike of a skate was employed in the same way. The two front claws of the armadillo were used for digging the ground, as the animal himself uses them. The shell of a river mussel formed a plane, to scrape down wooden tool-handles or oars. For this purpose, however, they did not take the edge, but broke a hole in the shell and used its edges. These people were hunters without dogs, fishers without hooks, and tillers without plow or spade. They show of how much development life was capable in the pre-metal period."¹¹ The most valuable qualities of the Guiana Indians are their "agility, dexterity, and the intuitive tact of tracking, or discovering footsteps in the bush. Their acuteness in discovering the trail of an animal and its species is also surprising. They not only hear sounds in the woods which are imperceptible to others, but judge with surprising accuracy of the distance and direction from whence they proceed. Bates reports having noticed in Indian boys a sense of locality almost as keen as that possessed by a sand wasp. He gives an example of his little companion, about ten years of age, who had been playing all the way with bow and arrow while they had been hunting, and yet, almost unconsciously, had noted the course taken."¹²

In these everyday matters of the struggle for existence the native is accurate, capable, and resourceful; but when brought face to face with something not within his range of experience, especially with anything abstract, he has difficulty in understanding it, and if he thinks at all about it he does it in a simple, logical, but usually fallacious way. His mental and emotional makeup often seem paradoxical. The Australian aborigines are at one time impulsive, at another phlegmatic; "they can exert themselves vigorously when hunting or fishing or fighting or dancing, or at any time when there is a prospect of an immediate reward; but prolonged labor with the object of securing ultimate gain is distasteful to them. They are industrious and painstaking in fashioning things that they know are of value to them and to the use of which they have been accustomed; but they are slow in adopting the mechanical contrivances of the whites. They love ease even more than pleasure. The natives hunt in order to procure food, not for the delights of the chase. Without being quarrelsome, they are always ready to fight—and, perhaps without premeditation, they are often cruel to the stricken foe."¹³ So too the African: "The native can love, and he can hate, but he is neither a good lover, nor a strong hater.

His affections are neither steady or permanent. He will, however, remember a wrong committed against him much longer than a good deed done to help him. If you are powerful he will effusively smile on you a week after you have unmercifully thrashed him, but if you are a nobody he will scarcely greet you the day after you have saved his life. He is moved more by fear of pain, by loss of material profit, and by public opinion than swayed by principles and arguments. He will float with the stream rather than continually struggle against it, but at the same time he can obstinately and doggedly follow a course that will result in physical pain, material loss and ridicule if he is once persuaded that his ultimate interests lie in that direction."¹⁴

The word *walu*, eight, in the Solomon Islands expresses the range of the native's abstract mental process. It implies a large number, or at least as large as he cares to worry about. *Walu malan* (many islands) means the world; *walu ola inau* is accurate enough for "all my belongings."¹⁵ The Kanaka does not think about abstract things nor does he give a thought to the conditions of existence.¹⁶ The Kaffir does not willingly bother himself with thinking about everyday affairs until they are forced upon his attention so that he cannot escape them. Much less has he ever thought out earnestly and consequently any transcendental matters.¹⁷ Holub,¹⁸ referring to the same South Africans, says "only their needs educate savages and drive them forwards in culture;" while Livingstone¹⁹ attributes much of native opposition to Christianity to the fact that they are forced to think about matters that have never before bothered them. "It is usually hard to make a native understand anything which is out of the way of his own simple life," writes Stigand²⁰ of the Bantu. "If one is well acquainted with his methods of thought, or rather his lack of method in this respect, and tries to turn the corner instead of going straight ahead, one may often convey a definite idea to him which it would be impossible to do otherwise. Or if one descends to his line of argument, one may prove to his complete satisfaction a point by absolutely worthless logic. A parallel occurs with us, where a smart repartee, having no logical value whatever and completely outside the point, will often discomfit an opponent and leave the maker with all the honours of war." The native comes in for much abuse owing to his vagueness about time and distance. "It is very annoying to the traveller, but it cannot be helped. He has never had a watch, he has no words for times of the day except morning, evening, and sometimes noon; and evening is the only time really very material to him. He generally knows if there is time to reach a certain place or village before it gets dark. As to distance, it really does not concern him much if he takes a few days more or less to reach a place. Time is no object to him. The same applied to season. He would probably remember if a certain event happened during the rains or during the harvest season, but practically never how many years ago it was. He would be equally vague about the number of months that have elapsed since an event. He generally errs on the lesser side; he will say it was two months, when it was ten, but never say ten, when it was really two. . . . The chief difficulty I laboured under was that there was no word for 'straight' in their language. When I came to think it out, those natives had never in their lives seen a straight line or anything straight. Their huts are round, their trees crooked, they lived in a

state of nature, and there is nothing that I know of in nature that is straight except the horizon at sea. The same thing applies to balance, level, and almost everything that we have to do with in our life." The natives of the Niger Protectorate have difficulty in adapting themselves to something strange like stairs: "Many Jekris can now walk up and down stairs, but the Sobos and Ijos are still clumsy at it. In going up, they will take perhaps one step, while trying to take two; then when they have gone up two or three they look around to see how it is that they are so high up; then they take or miss a step or two, bark their shins, and look around again. Coming down is much worse, and but for the rails many would come to grief, as they cannot judge the distance from one step to the next lower. They put one foot forward but not downward, neither do they bend the standing leg, hence they paw the air and swing around towards the rail in the most awkward manner."²¹

Speaking of the logic of the savage, Trilles²² says that if the native appears to us in any case to be ridiculous, foolish, or senseless it is most often because we have missed the true explanation, which is that his thoughts simply and rigorously follow the same channel, from what precedes to what follows. When viewed in the light of primitive logic, the beliefs and religious and social customs of savages form a body of doctrine which is compact and important when all the members are closely united. The tendency of the primitive mind to reason *post hoc, ergo propter hoc*, is universal. Many natives of the Congo now believe that European salt causes sleeping-sickness so they will not touch it but use native-made salt in its place.²³ In 1842 dysentery raged fearfully in one of the New Hebrides; the natives traced it to some hatchets taken on shore from a sandal-wooding vessel, and threw them all away.²⁴ Several centuries ago, certain Chinese, urged on by a reform governor, gave up their practice of sexual hospitality. "Poor harvests and general misfortune ensued, because, said the people, they had foregone a custom cherished by the gods."²⁵ When the Merkedes, an Arab tribe, became Wahabys, they had to give up the same custom; a drought followed and, considering it a punishment, they got permission from the Wahaby chief to return to the good old practice of their forefathers.²⁶ When the Arctic explorer, MacMillan, returned in 1924, he reported that his expedition had found coal in Ellesmere Land, but that the Eskimos had never used it. They did not know it would burn. "When we showed them a coal fire one family went to the coal deposits, but they were asphyxiated by the fumes [their igloos lacked modern ventilation] and some were killed. Now they will not touch it."²⁷ Numerous illustrations of this characteristic of the primitive mind will be found throughout the section on religion.

"Natives are as inquisitive as they are incapable of keeping a secret. The latter is a fortunate evil. Were negroes able to hold their tongues, there would not be a white man alive in Africa to-day. . . . It is extremely difficult to find, in native statements, the line of demarcation between deliberate falsehood, lapse of memory, and a congenital inability to distinguish accurately between the real and the unreal. They all lie, all, without a single exception, though in

various degrees, and they themselves know and sometimes admit it; and I have met one, at least, who expressed to me, with apparently genuine feeling, his regret for this hereditary defect. The average native does not appear to see any fundamental difference between reality and imagination—a point of view for which, if they only knew it, they could find a measure of justification in the writings of more than one philosopher. . . . I then soundly rated Mohammad for telling such lies, when my head-boy interfered by saying in a conciliatory tone, 'He did not lie, master. He said it only to make conversation.' ”²⁸

§203. Death Not Inevitable.

THE Solomon Islanders have a legend which explains, to their satisfaction, how death came into the world. Agunua created men. He created a woman, who, when she became old, went one day to change her skin in the stream, for that was then the custom. She had a daughter whom she left in the village. When the old woman had changed her skin and came back, looking young and lovely once more, her daughter said, "This is not my mother, this is a strange woman," and would have nothing to do with her. So the old woman went back to the stream, but the water had carried away the old skin, and she wandered some way down the stream before she found it, where an eddy had carried it against a bough overhanging the water. She put on the old skin and returned to her daughter. "Now I know you," said her daughter; "you are my mother." And so death came into the world because the child cried and did not know her mother. Otherwise men would always have changed their skins when they grew old. The same story is told in the Banks Islands of *Iroul*, the grandmother of *Qat*; and in Florida of *Koewasi*, who is said to be superhuman. The stories are exactly alike, even in details.¹

The explanation of death, in Lifu, Loyalty Islands, is of a quite different nature. The natives have no idea of the origin of the first man: they only know that his name was Walelimemë, that he had a wife and sons, and that he lived in peace and plenty. At that time there was not any sickness or death, and it was not necessary to work in plantations, because the food grew spontaneously and in abundance. This Garden of Eden did not last. "On one occasion the eldest son, in the form of a rat, went on an exploring expedition, boring his way through the earth until he came to the residence of an old man, the chief of the lower regions. This old chief lived upon yams, of which there were not any at that time on Lifu. . . . The old chief was angry with them, and told them that as they had taken his yams, he would henceforth live upon human flesh. Death should reign on Lifu in order to supply him with food." It was then that people began to die, as the Lifuans suppose, to supply the old chief with human flesh in exchange for his yams; and to this day some of the old men believe that there are more deaths when there is a good yam-harvest, the old chief requiring the bodies of men in proportion to the quantity of yams that they obtain. The traditions of these people have had their weight in leading them to embrace Christianity. When the missionaries arrived, the natives listened to the story of the Fall and said, "Yes, this is no doubt true, it is very much like what our fathers told us. They ate the forbidden yam, and

²⁸ Coudenhove, in *Atl. Mo.*, CXXXVIII, 169.

¹ Fox and Drew, in *JAI*, XLV, 138.

death came among us, and we had all to work to provide food." Noah's Ark was Nol's canoe; and the Tower of Babel was the ancient *ija* or scaffolding. The account of the Creation was simply the act of their venerable fisherman who drew the islands from the sea; and they saw in the beloved Joseph the petted "Ulauleti" who could not be destroyed. In their unaffected state, "death, like sickness, was usually ascribed to ill will on the part of an enemy. The death of a chief, although he had lived to be a hundred years, was always attributed to sorcery, and when dead they would stuff his eyes, ears, nostrils and mouth full of leaves from a certain tree, that the person who they declared had caused his death might die. There was, and indeed is still, a remarkable indifference about death. They speak of it and bid each other good-bye as if going on a short journey."²

The natives of Trobriand Islands admit that there may be illness from natural causes, and they distinguish it from bewitchment by evil magic. According to the prevalent view, the latter only can be fatal. "Thus the third road to Tuma [spirit world] includes all the cases of 'natural death,' in our sense of the word, of death not due to an obvious accident. To the native mind such deaths are, as a rule, due to sorcery."³ When a man dies in D'Entrecasteaux, his death is nearly always attributed to sorcery. At Afufuya a native died two days before the authors⁴ visited the hamlet. "The symptoms, as far as we could learn, indicated dysentery, which was rather prevalent at the time throughout this region. But the Afufuya people believed that two men from the neighbouring district of Dududu had cut a cross in the track with the point of a knife and chanted a magic song over it. The deceased had trodden on this place, and fallen sick and died. It constituted a legitimate ground for hostilities, and two weeks later the two districts were at war."

To the mind of the African Baganda there is no such thing as death from natural causes. "Both disease and death are the direct outcome of the influence of some ghost. The reason why ghosts cause sickness or death may be due to some evil-disposed person who has invoked the ghost's aid against the person whom he owes a grudge, or it may be the sick person himself has transgressed some custom and incurred the wrath of the ghost."⁵ In spite of all the illness, and they have a good deal of it, nobody dies a natural death, according to the belief of the Bawenda; while the Ba-Mbala employ the ordeal to discover "the malign influence which is supposed to be responsible for every natural death."⁶ No deaths among the Nigerian head-hunters are due to natural causes, whatever the age of the deceased; a person is killed by magic.⁷ Among one tribe in East Africa sleep is called a "little death,"⁸ while another tribe believes that people did not die until one day when a lizard said to them: "All of you know that the moon dies and rises again, but human beings will die and rise no more."⁹ It is said that the Ethiopians possessed a marvellous fountain the water of which kept them in perpetual youth.¹⁰

Indifference to life is witnessed by the often frivolous causes for suicide;

¹⁰ Herodotus, *Hist.*, III, xxiii; Maspero, *Hist. Anc.*, I, 666-667.

there is often in self-destruction a strong element of retaliation.¹¹ In parts of Africa, suicide "is resorted to quite as a matter of course, on the least provocation, even by children when they have been scolded by their parents."¹²

Among the Chukchi of Siberia "voluntary death"—suicide in the case of young people and, in the case of the old, being killed by some near relative at their own request—is considered preferable to a natural decease, which latter, indeed, is held to be the work of the *kelet*, or evil spirits. "To die by one's own volition is equivalent to freeing oneself from the malevolence of the *kelet*, and is at the same time a sacrifice to the *kelet*, since a breach of the formally expressed determination to die is punished by them. A voluntary death is not only better than a natural one, but it is even considered praiseworthy, since people who die this kind of death have the best abode in the future life."¹³ It is well known to the Sema Nagas that death is caused by the soul leaving the body, more or less, it would seem, at the former's own desire. "Thus when a man is even unconscious from any cause or when he is seen to be dying, he is held up in a sitting posture, and two persons, by preference those with the strongest lungs, bawl into the dying man's ears. . . . Meanwhile all present are crying and howling, and as long as there is life in him are reasoning with the dying man, telling him it is better to live, and asking why he behaves in this untoward way. It seems clear from this procedure that the soul can perhaps be induced to remain in the body if convinced of its folly in leaving it. On one occasion the writer saw the eyes of the corpse carefully closed and the lips compressed and held together for a long time, as though to prevent the dead man's soul from escaping."¹⁴

The Alfurs of Buru believe that every man possesses a *moeli* and every woman a *kesan*, both terms signifying evil spirit, which can be used to inflict illness or similar misfortune on others. The religion of the Alfurs forbids using either. At every death there must be an investigation as to whether the deceased died a natural death or whether the death was the result of the action of a *moeli* or *kesan*.¹⁵

The general theory regarding death prevailing among the Quileute Indians is that it was originated by Raven, and the story told of its origin differs very little from similar tales among other Indians of this region. "The Quileute make no distinction between natural and unnatural causes of death; by this I mean between death caused, for example, by the infliction of a wound and between death caused by the occult powers of some malicious shaman. A person simply dies, because his soul has left him, the causes which brought about this departure being immaterial."¹⁶

The Omahas are said to have looked on death as one of the inevitable things in life. "The old men have said: 'We see death everywhere. Plants, trees, animals die, and man dies. No one can escape death and no one should fear death, since it can not be avoided.' While this view tended to remove from the thought of death any supernatural terrors, it did not foster the wish to hasten its approach. Length of days was desired by all."¹⁷ This view seems extraordinarily sophisticated for an uncivilized people. More typical is the notion of the Araucanians that no one dies a natural death. "Death is due to sorcery, or poisoning,

frequently committed by some enemy in his *pilli* form, or some malign spirit, who assumed any shape at will, as that of a snake, lizard, fly, ant, etc., and thus operated with little fear of discovery, or became invisible, although his corporeal body none the less existed." When the head chief of one section died suddenly, probably of apoplexy, during a feast in a neighboring village, this manner of death, so uncommon among the Indians, was immediately set down to witchcraft, there being no visible cause to explain it.¹⁸

§210. Animistic Beliefs.

The Evidence from Sleep and Dreams. A relative of a murdered Australian in New South Wales goes to sleep with his head on the corpse, expecting that the deceased will reveal the murderer in a dream.¹ By the natives of the Papuan Gulf, dreams are associated with spirits and are said to be the communications of spirits who have wandered from the body whilst it was asleep and have had conversation with other spirits. "Great importance is attached to dreams, and sometimes trouble ensues in consequence."² In the excitement of a fight the soul of a man may "jump out of his body." The natives say, "That time you kill man, you lose sense altogether, no think about woman, pickaninny, house." The soul generally comes back during the sleep after a fight, and on the return of a war-party there is an observance calculated to restore the soul to its normal state.³ The Bina of Papua believe the soul dwells in the stomach of a man and that it vacates the body during sleep and sickness, leaving by way of the mouth. The reason for leaving the body during sleep is in order to take counsel with the spirits. "A dream reflects the actions of the Niro-iopu (soul) when it leaves the body during sleep. Great importance is therefore attached to dreams. What induces it to vacate the stomach during sickness is not clear; but a Bina tribesman will never attempt to awaken suddenly a sleeping person, neither will he talk in a loud voice or permit noise in the vicinity of a sick person, for he believes that if the Niro-iopu was temporarily away from the body of the sleeper or the sick person it might be afraid to return, in which case the person would die. Further, he believes that prolonged absence of the Niro-iopu from the body is the real cause of sickness."⁴ Among the southern Massim the souls of dead people might be seen in dreams, when they might talk to the dreamers;⁵ while the natives of San Cristoval believe the soul goes out in dreams and in unconsciousness. "Death affects the body but not the soul. *Mae*, death, is the going out of the soul from the body, so that a person who is unconscious is said to be *mae*, dead. A person may be very ill, there may be obviously no hope of his recovery, but he is not *mae* till he becomes unconscious."⁶

Partly through dreams and partly through the condition during sleep, trances, and states of syncope, the Tshi-speaking negro has arrived at these conclusions: (a) that he has a second individuality, an indwelling spirit residing in his body, which he calls a *kra*; (b) that he himself will, after death, continue his present existence in a ghostly shape; that he will become, in short, the ghost of himself, which he calls a *srahman*. The Ewe term corresponding to the

5 Seligmann, *Melanesians*, 657.

6 Fox and Drew, in JAI, XLV, 161.

Tshi *kra* is *luwo*; both existed before the birth of a man, probably as the soul of a long series of men, and after his death it will equally continue its independent career, either by entering a new-born human body or that of an animal, or by wandering about the world without a tenement. Any involuntary convulsion, such as a sneeze, which is believed to indicate that the *kra* is leaving the body, is always followed by wishes of good health. "When a negro awakes feeling stiff and unrefreshed, or with limbs aching from muscular rheumatism, he invariably attributes these symptoms to the fact of his *kra* having been engaged in some struggle with another."⁷ The Bangala of the Congo believe that if a person faints or becomes unconscious it is because his embodied spirit has left; on the patient reviving it is thought that the soul has returned. The soul of a dying man escapes through the nostrils and mouth; hence these are plugged and tied immediately on death to keep the spirit in the body.⁸ The Ba-Mbala say nightmare is caused by ghosts returning and seizing people by the throat.⁹ According to Ba-Huana notions, three elements enter into the composition of a man: body; soul, called *bun*; and double, called *doshi*. "The *bun* of a dead man who has had no fetishes can appear to other men; such an apparition occurs at night only, and the *bun* is seen in human form and appears to be composed of a white misty substance. It portends approaching death. The *doshi* is a shadowy second self, corresponding to the *kra* of the Tshi-speaking tribes of the Gold Coast, and the *ka* of the Ancient Egyptians. It leaves the body in sleep and visits other people in dreams; the *doshi* of the dead appear to the living in the same manner. All people have *doshi*, but only the adult have *bun*. . . . Animals have *doshi* but not *bun*. At death the *bun* disappears, no one knows whither, but the *doshi* lingers about in the air, visits its friends and haunts its enemies; it will persecute the relations if the body has not received proper burial; there are no means of exorcising it."¹⁰ Among the tribes in British Central Africa, "the *mzimu* [soul or spirit] is not tangible, and has no substance, but has the form of the man, and when set free from the body can talk and can do practically anything. The *mzimu* may leave the body of a man asleep and appear as a dream to some other man, just as the spirit of a dead man may appear in a dream; spirits are not visible under other conditions. The spirit is said to leave the body of a dying man before death at the time when he becomes unconscious or comatose. His shadow, which is part of the *mzimu*, leaves the body at the same time. The *mzimu* may appear to men at some distance away at the time of death of a man. The inanimate objects appearing in a dream are seen by the dreamer's *mzimu*, who is abroad among the objects seen."¹¹ The Wachaga believe the images of dead persons seen in dreams to have actual existence, and regard dreams as due to the direct influence of spirits who let them foresee the good or evil in store, in order to prepare for it.¹²

In India it is believed that "whereas the soul of an ordinary human being leaves the body automatically in sleep, trance, or death, and wanders about like the wind, not as he chooses but as other forces determine, the soul of the wizard or witch can assume a material form, leave the body at will, and go wherever it chooses."¹³ When a person sleeps, think certain natives of Farther

12 Gutmann, in *Globus*, XCII, 166.

13 Roy, in JAI, XLIV, 338.

India, some parts of his *kar-bu* [spirit] leave his body. "The explanation of our having only a confused remembrance of dreams is that only part of the spirit has been abroad in sleep and has only a vague impression of what it has seen. A person, especially one who is ill, should never be roused from sleep; in illness some of the parts of the *kar-bu* are in any case out of the body, and in sleep still more parts may have gone out. When these latter return, the person awakens naturally. Should he be rudely awakened he might die. Should he leave his bed when aroused, the wandering parts of the spirit, on their return, might fail to find him."¹⁴ The religious observances of the Lolos of West China are mainly an attempt to propitiate the evil spirits and ghosts, who bring disease and other disasters to men. "The Lolos consider that man has a soul. When a live person is seen in a dream, it is his soul that comes; when a dead man is seen in a dream, it is equally his soul that is visible, and next morning there must be prayer and sacrifices to appease the wandering soul of the deceased. When death occurs, the soul leaves the body with the last breath, and it is considered of vital importance that this event should be witnessed by some person, otherwise the death is impure, and the ghost of the deceased (*i.e.*, the released soul) will cause trouble and sickness to his relatives. . . . The soul is supposed to leave the body in cases of chronic illness. A complicated ritual is then read, a kind of litany, in which the soul is called by name and besought to return. . . . After the ceremony is over, a red cord is tied round the arm of the sick man, to retain the soul, and this cord is worn till it drops of itself from decay."¹⁵ The Dyaks place implicit confidence in dreams. "Their theory is that during sleep the soul can hear, see, and understand, and so what is dreamt is really what the soul sees. When anyone dreams of a distant land, they believe that his soul has paid a flying visit to that land. They interpret their dreams literally. The appearance of deceased relatives in dreams is to the Dyaks a proof that the souls live in *Sabayan*, and as in the dreams they seem to wear the same dress and to be engaged in the same occupations as when they lived in this world, it is difficult to persuade the Dyaks that the life in the other world can be different from that in this."¹⁶

Great importance was attached by the American Indians to dreams, whether they be common night-dreams or the dream-fasting of youths during initiation-ceremonies; they often carry out instructions believed to have been imparted to them in a dream by superior powers.¹⁷ There can be no doubt about the reality of the dream to the Guiana Indians, as evidenced in the following account by Roth:¹⁸ "One morning when it was important for me to get away . . . I found that one of the invalids, a young Macusi, though better in health, was so enraged against me that he refused to stir, for he declared that, with great want of consideration for his weak health, I had taken him out during the night and had made him haul the canoe up a series of difficult cataracts. Nothing could persuade him that this was but a dream, and it was some time before he was so far pacified as to throw himself sulkily into the bottom of the canoe. . . . More than once, the men declared in the morning that some absent man, whom they named, had come during the night, and had beaten or otherwise maltreated them; and they insisted upon much rubbing of the bruised parts of their bodies." The dream-origin of the doctrine of the soul is common

to many South American tribes.¹⁹ The Araucanians are convinced that their dreams are the nightly wanderings of their other selves or spirits, to which, however, they assign a material though invisible form. They are not invisible to the *pilli* or spirits of other Indians, and so when they dream of other persons they really believe their *pilli* have met. Thus also when they are attacked by nightmare or delirium tremens, the horrible forms their imaginations conjure up are considered to be real beings. "This belief that dreams are nothing but the wanderings of their bodies in invisible form, and that those persons dreamt about are really met, is the basis of their ideas of a future state, as they have thus an overwhelming proof that the dead frequently revisit this earth in the form of *pilli* or spirits. In the same manner the material forms given to their good and evil spirits are to be explained. If we duly remember that dreams and their events are very real facts in their philosophy, then we have the key by which many obscure and unexplained conceptions may be unravelled. It is common to hear one of these Indians relate in the most convinced and matter of fact way his having encountered one or other of these good or evil spirits, and give elaborate details of the meeting and its result."²⁰

Breath, Shadow, and Likenesses. Very important is the shadow in folklore: the shadow as soul, the underworld of shadows, the shadowlessness of spirits and elves, the shadow as essential part of man, the fear of loss of the shadow under the equator, the correlation of power and strength with shadow, the shadow as a protective "demon," the loss of the shadow, magic connected with the shadow, proverbs and sayings about the shadow, and so forth.²¹ Closely related to the widespread idea that man's shadow is his soul, is the belief that the soul is the breath, the reflection, or likeness.

At Eddystone, Solomons, "the soul is called *galagala*, which also means a shadow, a reflection; it is caught in a camera. A Shortlands man says 'it stop all over a man': by taking a looking-glass you can see it. When a man dies, his soul comes out at the mouth . . . it is just like a man and big or small according as it belongs to an adult or a child. A certain shadowiness seems associated with departing spirits, for one man asked us whether a vague figure in an advertisement of Odol was a ghost. Souls of natives are brown, that is, lighter than the living."²² Significant of our interpretation of *mana* is the inference that the word *mana*, or *mena* in San Cristoval, originally meant breath, power being a secondary meaning, owing to the fact that it is the breathing upon an object which imparts power.²³ The name given to the spirit, shade, or soul of a dead man by the Southern Massim is *arugo*. "*Arugo* is also the name for a man's shadow and for his reflection in a glass or in water, and though trees and animals have no active living 'spirit,' their reflection bears the name of *arugo*. At death the *arugo* leaves the body and goes to the other world." To the Koita, *sua* is something which at death leaves a man to lead an independent existence. "In this sense *sua* means ghost or shade, and it is thus that the Koita usually employ the term. . . . *Sua* may leave the body during sleep; if a man wake before his *sua* has returned, he will probably sicken. Sneezing is a sign that the *sua* has returned, and if a man does not sneeze for

many weeks together it is a bad sign, his *sua* 'go long way away somewhere.'"²⁴ In D'Entrecasteaux "the soul is inside the body, a separate entity the presence of which is revealed in sneezing. For a sneeze is due to the soul's recollection of some dead kinsman or friend."²⁵ That a spirit may reside in a likeness is seen in the instance which occurred at Geelvink Bay. A missionary noticed a figure of a boy branded on the back of a man, and upon asking its meaning was told, "That represents my dead son, whom I now always carry with me."²⁶

A word used by the Bangala of the Upper Congo River as an equivalent for spirit means literally shadow of person or thing, shade of tree or house, reflection in water or in a looking-glass, and, more recently, a photograph. The natives say a dead person casts no shadow, so to say that a person has no shadow is equivalent to pronouncing him dead. If for some reason a man did not see his shadow reflected when he looked into some water he thought someone had taken his spirit away and that he would soon die. Weeks,²⁷ who reports this significant case, states also that the natives believe their ancestors reappear and are "recognizable by similarity of features to those whose appearances the spirits took. When the white men arrived this belief seemed to be confirmed by the fact that they often thought they saw a likeness in the features, walk, or gestures of some white men to dead men whom they knew. I have often myself been amused when a motion, a glance, or some little peculiarity among these folk has called vividly to mind some person I knew at home. When we came here in 1890 my colleague was thought to resemble a chief who had died some time before, and I was thought to be like another who had died." A Bahima child is never allowed to see its own shadow cast upon the wall by firelight; "the shadow will become a ghost if looked upon by the child, and will catch and kill it."²⁸ The foundation of the Yao (Central Africa) religion is in the *lisoka*, the soul, shade or spirit which every human being possesses, and which is the inspiring agent in his life. "It is allied with the shadow, and would seem to bear to the body the relation which a picture has to the reality. Their word for a shadow is *chwilili*, which is also the term that they use to denote a picture, and pictures they associate with the shades or shadows of the dead. I have known natives refuse to enter a room where pictures were hung on the walls 'because of the *masoka*, souls, which were in them.' The photographic camera was at first an object of dread, and when it was turned upon a group of natives they scattered in all directions with shrieks of terror. 'The European,' they said, 'was about to take away their shadows and they would die.' In their mind the *lisoka* was allied to the *chwilili* or picture, and the removal of it to the photographic plate would mean the disease or death of the shadeless body." The author, with much difficulty, once persuaded a Yao chief to allow himself to be photographed, which permission was given only on condition that the picture was to be shown to none of his subjects but to be sent out of the country as soon as possible. He feared lest some ill-wisher might use it as a means toward his bewitchment. When, some months later, he became seriously ill, his illness was attributed to some accident having befallen the photographic plate, which was then in England. The

divining oracle, however, after consulting the lots, gave assurance that the picture was intact and that the disease must be ascribed to some other cause.²⁹

To the Mkamba of East Africa the world abounds in spirits. "What a spirit is he does not pretend to know; they say 'We see a man's shadow, and we say perhaps that is his spirit,' and for this reason the camera is still feared, because it robs men of their shadows. Yet no Mkamba knows positively that his shadow is his spirit, for even stones cast shadows, and whether they have spirits he would not like to say for certain. But every man has a spirit which lives on after the body is dead, though the nature of after-life is very vague."³⁰ Among other East Africans the soul is likened to the shadow;³¹ while the shades and manes of the Fan resemble those of the ancient Egyptians.³² The shadows (Vu-Vu) of things and people are regarded by the Dinkas as important. "At death, the shadow departs to the place of God. The word 'Vu-Vu' is used in the sense of soul, when speaking of the departed. The Golo theory of dreams is that the shadows of things and people enter the dreamer's mind during sleep. From this it would appear that the connection between the shadow and the substance is believed to be severed during sleep. . . . The fact that this is believed to be efficacious shows that the Golo does not allow experience to shatter illusions."³³

The Buryat of Siberia believe that man is composed of three parts: material body, lower soul or breath, and soul belonging to man only. The second is connected with de cease; when it leaves the body, death occurs. The third has a similar connection with sleep, leaving the body when one is sleeping. The second part of the soul does not leave the earth, but continues to dwell on it in a manner exactly similar to that which the man formerly followed, while the third part of the soul is born again in the form of a human being. Among the Koryak a person is declared dead when breathing ceases; this is considered to signify that the chief soul has deserted the body. There is, however, another soul called "breath," and still another called "shadow." They draw no very sharp line of demarkation between life and death. A corpse is not "deprived of the ability to move. The deceased may arise, if he is not watched. . . . The soul of a deceased person does not leave the earth at once, but hovers high above the corpse. It is like a flame. During illness it is outside the body, hovering low over it if the illness is slight, higher if it is severe. . . . When the soul of a deceased rises to the Supreme Being, the deceased himself and his other soul, or his shadow, descend underground to dwell with the Peninelau—"the ancient people, people of former times." The word *tyn* signifies to the Altaians vitality, i.e., a soul common to plants, animals, and man, and is synonymous with breath. "The Altaians say that one can hear a sound as of the snapping of a string when the *tyn* is departing. One must not approach too near to a dying man, for the belief is that in such a case the *tyn* of a living person can pass into the latter."³⁴

In India the soul or spirit of a man is sometimes identified with his shadow; a man of strong individuality is said to have a powerful shadow, a weak or nervous person to have a light shadow. "The shadow of a man of the former type falling even on a venomous snake is believed to be able to hold the snake

spell-bound at the spot and make it unable to budge an inch.”³⁵ A word which primarily means shadow is used normally in Sema eschatology for the soul of a dead person. The same word also means reflection and is used to denote any likeness or image. The daughter of a Sema chief was in much trepidation when the author³⁶ tried to photograph her, and was with difficulty reassured that he had not deprived her of her soul when he took her picture. She was only really satisfied when it was given back to her to keep in the form of a print. Palaung children are taught that they must not step upon the shadow of a monk, a chief, or any old person. “They do not now consider that the person on whose shadow a foot has stepped will be harmed in any way, but to step on the shadow of any important person is disrespectful. It will harm, not the person whose shadow has been treated with disrespect, but the person who does the disrespectful act.”³⁷ A case related to burial-preparations is mentioned from the Malay Peninsula in which “there was some hesitation on the part of those present as to whether it was not actually noon, in which case they said the burial would have to be postponed till the afternoon, since the shortness of their shadows at noon would (sympathetically) shorten their own lives.”³⁸ It is hard to get photographs of the Moros: “They were unduly influenced by the remarks in the Koran concerning the making of pictures of living things, and furthermore many of them believed that if they were photographed they were sure to die within a year.”³⁹

According to ancient Maori tradition as concerned with the first woman, the Earth-formed Maid, “when the spirit or soul, and the breath of life, were implanted in the figure of earth, behold it sneezed, breathed, and opened its eyes,—a thing endowed with human life, a person, a woman.”⁴⁰ To questions about the nature of the soul the natives of the Trobriand Islands reply that the *baloma* is like a reflection in water or a mirror, and that the *kosi* is like a shadow. “When forced against a metaphysical wall by such questions, ‘How can a *baloma* call out, and eat, and make love if it is like a *saribu* (reflection)? How can a *kosi* hammer against a house, or throw stones, or strike a man if it is like a shadow?’ the more intelligent replied more or less to the effect: ‘Well, the *baloma* and the *kosi* are like the reflection and like the shadow, but they are also like men, and they behave all the same as men do.’ And it was difficult to argue with them.” To judge leniently such inconsistencies of native belief, it is sufficient, as the author⁴¹ notes, to remember that we meet the same difficulties in our own ideas about ghosts and spirits. No one who believes in them ever doubts that they can speak, and even act; they can rap on tables, lift objects, and make other material manifestations.

The Kwakiutl Indians believe the soul is like smoke or a shadow,⁴² while those of British Columbia hold that the breath of a person is the manifestation of the spirit within him. “A person’s breath conveys both good and evil influences. For example, a man seeking mystery power should never permit the breath of a woman to pass upon him or enter his lungs; it would nullify all his efforts, and effectually prevent the acquisition of the powers he sought if he did so. The verb ‘to revive’ . . . shows how closely and intimately the breath

and life or spirit of a person was connected in their eyes." The term means in English "to sigh or breathe in the spirit, and open the eyes."⁴³ Many Indians to-day view picture-taking devices with superstitious awe, and if they allow themselves to be photographed they often keep their eyes on the ground while they pose.⁴⁴

The soul as a shadow was a concept familiar to the people of classical antiquity:

Bis duo sunt homini, manes, caro, spiritus, umbra:

Quatuor haec loci bis duo suscipiunt.

Terra tegit carnem, tumulum circumvolat umbra,

Manes Orcus habet, spiritus astra petit.

Miscellaneous Beliefs. Of a tropical Australian tribe it is said that they accept the existence of the soul before birth. The name given to the soul in this stage is Rai. "The Rai are supposed to be sitting in trees, like birds, and to enter the body of a woman independently of sexual intercourse."⁴⁵ The natives of both New Caledonia and New Hebrides thought white men were the spirits of the dead; in the former case, they believed these white spirits brought sickness and gave this as the reason why they wished to kill white men; in the latter, they thought the whites were made by the great spirit, *Nobu*, and to this day they call foreigners, whether white or black, by the name of *Nobu*.⁴⁶ In New Britain there is a realistic belief that the spirit of man may leave his body for a time and enter into animals, birds, or fish. But should the creature into which the spirit of a man has entered be killed while he is in it, then the man's body dies. "On one occasion in my town," reports Danks,⁴⁷ "a man was wounded by a spear thrust in the shoulder during the night. Next morning he was questioned about it, and declared that he had entered into a fish, and happening to come near the reef on which were some men with a torch and fishing spears, the fish was wounded close to the fore fin, and so his body received the wound."

The Buryat of Siberia think the soul is material and visible to human beings, and usually takes the form of a bee. In one of their legends a man saw how a bee came out of the nose of his sleeping comrade, flew and crept about the hut, crawled upon the edge of a water-receptacle, fell in, emerged with difficulty, and finally returned into the nose of the sleeper. From subsequent conversation it appeared that the dreams of the latter corresponded completely with the actions and adventures of the insect. The Buryats never kill a bee that flies into the hut lest damage be done to someone's soul. Again, two Votyaks went into the woods to work; and while they rested, one smoked and the other slept. The soul of the sleeper emerged from his mouth with a sudden sound, flew to a pine tree, entered a hole, returned, and entered the sleeper's mouth. He woke and reported a vision: that he had found, in a hole in a pine tree, some money in two hollow sticks. The two went home, but the smoker returned later and, on examining the hole which the soul entered, found the money.⁴⁸ The idea that the soul and body can be separated without death ensuing at once is common to many tribes of the Naga Hills. "Among the Aimol, the priest, after a child's birth, summons the soul to take possession of its

new dwelling, the child's body. Among the Lushais the father and mother keep quiet for seven days after a child's birth, for fear of injuring the little one's soul, which is thought to hover and perch like a bird on their bodies and clothes."⁴⁹ The Palaungs do not consider the soul to be one and indivisible but to be composed of many separable parts, some of which may detach themselves from the rest. "For instance when a man starting on a journey begs his father and mother to protect him on the way, he actually expects that part of their spirits will go with him. . . . No one would live in the house formerly occupied by a man known to have been bad, or wear his clothes, or use his household goods." If the powerful spirits are pleased, they show the way to a spirit that is looking for a mother; if they are angry, they may prevent any spirit that might become the soul of a future child from coming near. "A child may be born and may live without having a spirit in it. It is then an imbecile, but it must be kindly treated and cared for, as its spirit may yet find its way to the body that it should have entered before the child was born." By tying white threads round the wrist, the spirit may be kept from fleeing away.⁵⁰

The Alfurs, believing that the soul of a newly born child is only lightly attached to the delicate body, close the door at childbirth, in order to prevent the spirit from gliding away; the Bulgarians, on the other hand, believe that the animation or "besouling" of the child takes place at the moment of birth and so they open the door to the entering spirit.⁵¹ The idea of comparing the soul to a bird, or of identifying it in some way with a bird, of worldwide distribution, is well known to the Malays, who call the soul the *pingai* bird and in their magical invocations address it with a word used in calling chickens. "The Semang woman is said to carry about with her a bamboo receptacle, in which she keeps the soul-bird of her expected progeny; this bird is really the vehicle of her child's soul, and she is expected to eat it to enable the soul of her child to be developed." As soon as the child is born, the afterbirth is buried under the birth-tree or name-tree of the child. "The bird, in which the child's soul is conveyed, always inhabits a tree of the species to which the birth-tree belongs; it flies from one tree (of the species) to another, following the as yet unborn body. The souls of first-born children are always young birds newly hatched, the offspring of the bird which contained the soul of the mother." The Eastern Semang think that each man possesses a soul which is shaped like himself, but is "red like blood" and "no bigger than a grain of maize." It is passed on by the mother to the child, in a way they cannot explain.⁵² The Sakai say the souls of the dead become white butterflies and that, for this reason, it is forbidden to kill such insects.⁵³ According to Maori belief, the soul of a child is implanted in the foetus before birth, at the time when the eyes assume form; they are believed to be the first parts so to gain form.⁵⁴

The Greenland Eskimo think that man consists of three parts: body, soul, and name. The soul is small, not bigger than a finger or hand; if it gets sick or dies, so does the man; if bewitched out of the body, the shaman can get it back.⁵⁵ When fishing, the Tlinkits talk to their halibut-lines, hooks, and floats, calling them "brother-in-law," "father-in-law." It is believed that if they did

not do so they would not have any good luck.⁵⁶ When Boas⁵⁷ asked the shaman among the Kwakiutl about the soul, the latter replied, "Did you not see the soul last night, which came and sat on my hand? It is the size of our thumb, when it shrinks and becomes small; then I put the soul on top of our head, and it grows so that it is of the same size as our body, for the body is the house of the soul." The souls fly about at night and in the morning when it is nearly daylight they come home to the owners of the souls and tell where they have been and what they have seen. Sometimes the soul comes back the wrong way, when it returns to the owner, and is hurt; this is especially the case when it returns quickly and goes in crosswise or upside down. The man then becomes sick and goes to the shaman, who tells him that his soul is in the wrong way. After an elaborate shamanistic treatment the soul is set right. Like the Eskimo, the Nutka and Hurons believe in the soul of a person in the form of a tiny man.⁵⁸

Though the souls, in Homer, are as unsubstantial as dreams, yet they not only have the human form but also may feel anger or joy, or may weep; they partake eagerly of the blood and wine and honey which are provided.⁵⁹ In the Zend-Avesta it is stated that the soul is added to the fœtus after four months and ten days.⁶⁰ In ancient European mythology it was held that in sleep the soul might leave the body as a snake;⁶¹ or that the soul-voice was like a bat;⁶² while a few years ago in New Jersey a woman claimed she saw the soul of a dying man pass from his lips and take the form of a butterfly.⁶³

§211. Transmigration and Reincarnation.

WHEN an Australian dies it is supposed that his soul leaves his body, by way of the mouth, and enters the body of a white man, also passing in through the mouth. "The whitefellow who thus becomes the domicile of the dying black man's soul is supposed to be born at the time of death of the blackfellow."¹ This belief in white reincarnation, found also in Tasmania, is thought by some to come from anthropophagy, the color of Tasmanian flesh when roasted and skinned being whitish.² According to a belief in New Britain, "every man dies six times, each time passing down to a lower stage, till he reaches Matika, and finally disappears."³ Natives of San Cristoval firmly believe in the continued existence of the soul after death. "Death is merely a migration. The soul may pass into an animal, or may be born again in a descendant, or may merely exist without any incarnation."⁴ The naming of a boy after the father's father and of a girl after the mother's mother may be due to a belief in reincarnation, combined with the idea that the reincarnate spirit must enter the body of one of his or her own moiety or clan. A case is cited where a boy was named as usual but was very sickly when but a few days old; at this time a man died and his spirit returned into the sickly baby, when it was given his name, and the boy recovered and grew strong. When a child cries, names of the dead are called till he stops crying, to show which he desires, that is, what

ghost has been reborn. "I have, myself, seen this done," writes Fox,⁵ "in the case of the baby of a man named Mamake; this baby refused many names till, finally, in despair, Mamake said perhaps it was a Christian spirit, and tried the name Mary, at which the baby stopped crying, and Mamake immediately called her by this name, and suggested she should be baptised."

A South African chief in a speech once boasted of his wisdom, attributing its possession to the fact that he had been several times dead and had come to life again.⁶ A certain benevolent god of the Hottentots is a sort of grandfather of the whole people; his origin is accounted for as follows. A virgin, impregnated by sucking the juice of a certain grass-stalk, bore a son who grew rapidly to manhood, and who, the people believed, had been born several times before. He was recognized this time as their grandfather who had returned to his children.⁷ Every family among the Congo Bangala has a place called *liboma*—it may be in the bush or forest, on an island, a creek, or a tree—which is a sort of preserve for the unborn children of the family. "The disembodied spirits of the deceased members of the family perform the duty of supplying these preserves with children to keep their families strong and numerous. They have misty ideas as to how these *liboma* are supplied with children, but I have a suspicion that underlying the *liboma* is some idea of reincarnation. . . . Only the family to which the *liboma* belongs can give birth to the unborn spirits there."⁸ The Ba-Huana assert that in the case of a man who has been the possessor of many fetishes, the soul enters the body of some large animal—elephant, hippopotamus, buffalo, or leopard. Animals so possessed are recognized by their ferocity.⁹ The belief in the werewolf, under different disguises, is very common the world over, both among civilized and savage peoples. The Somal believes in a being who is a man-leopard; by day it is a man and by night a leopard. It seizes people by night, the intimate knowledge of a kraal and its habitants being gained in the guise of a man by day. The Somals also believe that people can turn themselves into hyenas at night. "A man alleged to be in possession of such a gift was brought for enlistment in the Somali irregulars in 1900. He explained that the gift was not a common one, and, as his services would be most valuable to the force in scouting at night, he required rather more than the ordinary pay; in fact he estimated his services at thirty rupees [about fifteen dollars] a month." Nothing could prevail on the man to give a proof of his powers.¹⁰

The Koryak of Siberia hold that the soul of some ancestor is sent by the Supreme Being into the child in the mother's womb. "These souls are hanging on the cross-beams of the house of the Supreme Being. . . . The father of the child enumerates the names of the deceased relatives on his and his wife's side. When the name of the relative whose soul has entered the child is mentioned, the divining-stone begins to swing more quickly. Another way of determining the identity of the soul is by observation of the behaviour of the child itself. A number of names are mentioned. If the child cries when a name is pronounced it shows that it is not the name of the soul reborn in the child. When the proper name is pronounced the child stops crying, or begins to smile."¹¹ When the Peking child is one year old, the mother passes a knife

along the floor between the child's feet, whereby the bond with which, in an earlier life, his legs were tied together following death, is symbolically severed.¹² A Jain believes that all souls are capable of being perfected by a series of lives of good actions, at length reaching a state of final liberation somewhat like the Buddhist Nirvana.¹³

The Nagas of India are firm believers in lycanthropy. "The theory and symptoms are clear and recognizable, and differ perhaps from most lycanthropists in other parts of the world. The Sema undergoes no physical transformation whatever. The 'possession,' if we may term it so, is not ordinarily induced by any external aid, but comes on at the bidding of spirits which may not be gainsaid, and under whose influence the man possessed entirely loses his own volition in the matter. . . . The soul usually enters into the leopard during sleep and returns to the human body with daylight, but it may remain in the leopard for several days at a time, in which case the human body, though conscious, is lethargic. . . . The possession is accompanied by very severe pains and swellings in the knees, elbows and small of the back in the human body, both during and consequent on the possession. These pains are said to be such as would result from far and continuous marching or from remaining long periods in an unaccustomed position. During sleep at the time of possession the limbs move convulsively, as the legs of a dog move when it is dreaming. A were-leopard of the Tizu Valley, in a paroxysm at such a time, bit one of his wife's breasts off. When the leopard is being hunted by men, the human body behaves like a lunatic, leaping and throwing itself about in its efforts to escape. . . . It is generally held, and doubtless not without some substratum of truth, that a man under the influence of the possession can be quieted by feeding him with chicken dung. Probably this produces nausea." A local chief once showed the author a wound in his back which he said was the result of someone having shot at him when he was in leopard form a few days before.¹⁴

Many Shan and Palaung children are born with curious patches of blue color on the skin, which generally disappear after a few months. At birth a child is carefully examined to see if it has any such markings. "If a man dies from the kick of a horse, and a child is afterwards born to his widow, with a blue mark in a similar position to that of the father's injury, it would not be considered by Palaungs to be the result of a maternal impression, but to indicate that the dead man's spirit has entered into the body of his child." The soul generally hopes to be reborn into the home that it still remembers, but it may happen that there is no woman there of an age to have another child, so the poor *kar-bu* wanders away seeking a new home and a new mother. For this task it is allowed only seven days. As the only place where the *kar-bu* can rest during the seven days of its search is in the body that it has so recently occupied, it often returns to rest there. The *kar-bu* and the two guardian spirits, all as small as the smallest insect, finally alight on the fruit or rice that its future mother is eating, and are swallowed by her along with the food. A Palaung story tells of children who after being poisoned and buried grew out of the ground as bushes. "When a flower was picked from one of these, the bush cried out, saying, 'Do not pick me, it hurts!'" It is interesting to compare Dante's account

12 Grube, in *Berl. Mus.*, VII, 7.

13 Deshmukh, in *JASB*, I, 77.

14 Hutton, in *JAI*, L, 43-44 (quoted), 45, 50 note. A bibliography on the subject of

lycanthropy will be found at the end of McLennan's article in the ninth edition of the *Encyclopædia Britannica*; it relates almost entirely to the European races.

of the Dolorous Wood in the *Inferno*, where self-murderers are found to have been turned into trees. Dante plucks a twig from a great tree, and the bleeding trunk cries out, "Why dost thou tear me?" The idea was probably suggested to Dante by the passage in Virgil. . . . In both these instances from European classics, as well as in the Palaung story, the human beings transformed into trees and bushes, had died a violent death, and in all three cases they still retained their human sensitiveness to injury and the power to cry out when hurt."¹⁵

The idea of metempsychosis is not unknown to the Sea Dyaks of Borneo. Gomes¹⁶ once met a native who treated a snake with the greatest kindness because he said it had been revealed to him in a dream that the spirit of his grandfather dwelt in that snake. "Some Dyaks speak of a series of spirit worlds through which their souls must pass before they become finally extinct. Some Dyaks say they have to die three times; others say seven times; but all seem to agree in the idea that after these successive dyings they practically cease to exist, and are absorbed into air and fog. They do not believe in an endless life, because perhaps they lack the mental capacity to conceive of such a thing." A notion of self-transformation into tigers is held by some of the tribes of the Malay Peninsula,¹⁷ while Wilken,¹⁸ writing of ideas of transmigration in the East Indies, under Hindu influence, says the conception is easy to primitive man because he feels no deep distinction between himself and the animals. In Samoa, if a body be lost beyond recovery, as at sea, the near relatives seek some insect or animal, whichever comes first upon a cloth spread for the purpose, into which they believe the spirit of the deceased has entered; that object is then carefully wrapped up and buried with ceremony and lamentation.¹⁹ "In one of the Tongan islands they would not kill flies. In Tahiti it was an insect that gave warning of death. In Ra'iatea it was believed that the spirits of the dead became cockroaches. In Tahiti the souls of children killed at birth appeared as grasshoppers. In Mangaia the voices of warriors slain in battle were recognized in the chirping of a species of cricket, and the souls of the dead buried in the great Aureka chasm were associated in some way with a species of red fly. In Rarotonga the grasshopper was an omen of death. In the Marquesas the souls of the dead were often recognized in crickets, and those of priests were supposed to ascend to the sky in the form of moths, developing afterwards into birds. In the Paumotu the souls of the dead were believed to enter into birds. In Niue they were seen in insects, lizards, etc.; and in Fotuna in an insect or reptile, or perhaps a bird. In Ongtong Java the soul could revisit the island in the form of a bird."²⁰

Among the beliefs of the Haida Indians reincarnation held a prominent place.²¹ A notion is current in another tribe that when a person dies his spirit returns to a woman and is reborn.²² Others figuratively resurrected the dead, especially great chieftains and persons noted for valor and wisdom, by the substitution of some person who they thought was like the deceased in person, age, and character. "The selection was made in council, by the clan of the deceased person; then all the people except the one chosen arose, and the master of ceremonies, gently lowering his hand to the earth, feigned to raise the

illustrious dead from the tomb and to give life to him in the person of the chosen one, on whom he then imposed the name and dignity of the dead chieftain, and the newly made chieftain then arose amid the ceremonial acclaim of the people."²³ One South American tribe thinks that all plants and animals are men transformed for bad conduct.²⁴ To the Guiana Indians the fact of the human actor having an animal form, or the animal an anthropomorphic one, is explained as being due to punishment or pure devilment at the instigation of the spirit of some person departed. "It is also a firm article of faith that the medicine-man, to whom nothing is impossible, can effect transformation of himself or others, similar to those produced by the Spirits. In addition, there is a widespread Indian belief that at every eclipse of the moon animals are metamorphosed—a tapir may change into a snake, a man into a beast, and vice versa."²⁵

Initiatory rites often have in them the idea of rebirth.²⁶ "Such rites become intelligible if we suppose that their substance consists in extracting the youth's soul in order to transfer it to his totem." This would cause a semblance of death or real death—"an exchange of life or souls between man and his totem." Frazer²⁷ gives a number of examples to prove this view.

Herodotus says that the Egyptians were the first to assert that the soul of man was immortal, born and reborn in various incarnations, and this doctrine he adds was borrowed from the Egyptians by the Greeks. To Plato it was already "an ancient doctrine that the souls of men that come Here are from There and that they go There again and come to birth from the dead." "A people who saw in a chance snake the soul of a hero would have no difficulty in formulating a doctrine of metempsychosis. They need not have borrowed it from Egypt, and yet it is probable that the influence of Egypt, the home of animal worship, helped out the doctrine by emphasizing the sanctity of animal life."²⁸ The scarab is said to be a symbol of rebirth.²⁹ The doctrine of resurrection is definitely stated in the Avesta, while such a belief, which is one of the chief dogmas of Christianity and of the Jewish and Mohammedan religions, was also a genuine Zoroastrian doctrine.³⁰

§212. The Name.

"DORIAN GRAY? Is that his name?" asked Lord Henry, walking across the studio toward Basil Hallward.

"Yes, that is his name. I didn't intend to tell it to you."

"But why not?"

"Oh, I can't explain. When I like people immensely I never tell their names to any one. It is like surrendering a part of them."

This excerpt from a modern author¹ embodies an idea familiar to many primitive peoples, that there is some connection between the name and soul

or that the name and the individual are closely identified. The same reluctance to tell one's name is common.

Hardy and Elkington,² writing of their experiences in the South Seas, remark: "You can implore a native to tell you his name, but it has no effect. He will tell you some name, if you press him hard enough, but it won't be his, as you will discover if you try to find him again." As an instance of this practice, Hardy, particularly struck by a canoe he saw lying on the sand in the main street of Elevera, and seeing a native standing by, asked him if the canoe belonged to him, as he would like to buy it. The native smiled blandly and shook his head.

"Don't you know whose it is?" asked Mr. Hardy.

"Don't know; man over there, p'r'aps," said the native.

"What's his name?" Mr. Hardy pursued.

"No name." The native shook his bushy head.

"Well, show me which is the hut he lives in."

At this question the man began to fidget, and then, glancing carelessly at the row of huts, all as like each other as peas, he swept his hand past the whole lot and said: "That one." And that was all the information concerning the name and possessor of the canoe that Mr. Hardy obtained. Subsequently he learned that the owner of it was the very man he had been questioning." The same authors comment upon other attitudes toward the name: "If a native is rich, the first way he shows it is by changing his name, and, as in England, money has to be spent for this privilege; in the New Hebrides it means a feast, and a big one at that. On announcing his desire for a new name to the chief, and proving that he has the means of paying for it, the native goes away by himself for a few weeks, during which time he is considered 'duli' and is not allowed to see a woman, and only permitted to eat certain things, as in the case of the New Guinea natives when they become *ibito*. After his seclusion he is known by his new name, and attends the big religious feast which he himself has provided. Other ways are found for changing names, and certain natives are rewarded for their bravery and good deeds by being given a new one, in much the same way as a man is knighted in England."

"Fifteen years ago the Port Moresby native was very unwilling to tell you his name," reports an ethnographer,³ from New Guinea. "He always got a friend to tell you his name. Possibly there was some magical idea at the back of this." The Papuans regard it as bad manners to ask anyone his name. "Lifuans were reluctant to mention their own names."⁴ Young men in Kenya Colony, East Africa, refuse to state their first name, "from a desire not to impart anything of what is an essentially personal part of their being; the same idea being found in their horror of anyone, however friendly, obtaining their hair. Women refuse to mention the *kainet*, or first name, of their fathers or husbands; such is indeed a formula in the rare instances of divorce amongst the tribe, the reason being given that it is unseemly to call a man by the name used by his mother; there would seem to be a sexual idea underlying the prohibition. Men do not use their wives' names, but call them *kaita*, wife, or else a nickname, for the same reason."⁵ The fact of the matter is that the name is intimately associated with the soul or the personality; it is an essential part of a person. When an event of significance occurs in a person's life, this may

be marked by a change in name, as when the Tubu takes a new name after killing an enemy.⁶ By way of contrast, it is said of the lowly Bushmen that no one has a name peculiar to himself,⁷ while the undeveloped Veddahs also appear to be without name.⁸

In India, the Sema has the same disinclination to mention his own name that most Nagas have; "it may have some connection with the notion that a man's soul answers to the name as well as his body." The Sema never gives to the child the name of a living relation, though the names of dead ancestors are popular among those with a child to name. "The explanation given is that, if the name of a living senior be given, the elder will die, as a substitute for him in this world has been provided."⁹ In Assam, "each individual has a private name which may not be revealed. If anyone should allow his private name to be known, the whole village is genna [tabu] for two days and a feast is provided by the offender."¹⁰ One day when Evans¹¹ was questioning a native as to how the Dusuns chose names for their children, the latter said, "You know, Tuan, my name used to be Logus, but it was a very dirty name, so I changed it to Gumpus." Wondering what he meant, and thinking that Logus had perhaps an indecent meaning, Evans asked him why he said Logus was a dirty name. "Oh," he replied, "while I used that name I was always ill and could not get down to the river to bathe, so I changed my name to Gumpus, and then I got well." In the East Indies no one wants to tell his name. The Dutch authorities had much trouble over this. The man asked would give a questioning look to a comrade or say, "Ask him." This is stated to be the situation in all Indonesia without exception.¹² In the Malay Peninsula the magician exercised great power over the tribe through the fact that he could deprive a recalcitrant member of the tribe of his or her name. "In such a case the magician went in full state to the house of the offender, and there solemnly burned the headband of the person concerned, who by this means was completely excluded from the clan."¹³ The natives of Borneo believe that without a name there would be no existence. How could a nameless thing be admitted to the next life? "The receiving of a name is really the starting-point of life; and the bestowal of a name by the parents is probably the most serious of parental duties, and to be performed with ceremonies proportioned to their rank. So essential is the ceremony of naming that in the enumeration of a family an unnamed child is not counted; and should a child die before the ceremony of naming, a Kayan or Kenyah mother would mourn for it no more deeply than had it been stillborn. This is true even when an unnamed child lives to be nearly a year old."¹⁴

The naming of the Maori child indicates a belief in transmigration: the priest repeats a long list of names of ancestors, and when the child sneezes that which was then being uttered is the one selected.¹⁵ When a Polynesian chief acquired the title a certain sanctity passed to him, water or oil being used in some islands as a medium by which the passage was effected. "It was on his succession that the god entered into him, having, perhaps, selected him as a successor, and influenced the will of the deceased chief, or the elective

body, that formed the human machinery for giving effect to the divine choice." The sanctity may be thought to have been in the man because he had become the duly appointed head of the group, yet there is some evidence which points to a conception of sanctity as inherent in the title itself. There would be nothing surprising in this, for the idea that a man's name is an actual part of himself is widely spread among savage races; "the man would be identified with the name, and the name with him, and the sanctity would be attributed to both." The idea of identity between a man and his name is seen in the consequences which followed an exchange of names. Further, the Tahitian warrior, by securing the body of a dead enemy-chief and taking his name, acquired a claim to his land, and a somewhat similar usage prevailed in the Marquesas. There should be noted also the ability of a doomed victim to escape by claiming the name of a taboo-chief, the use of another person's name for placing a taboo on an object, and the employment of a man's own name or that of some other person for the purpose of bewitching the property of a suspected thief.¹⁶

The East Greenlanders, besides their notion that the name is one of the souls, regard it as one of the components of a man. "The name is as large as the man himself and enters into the child after its birth, on its mouth being damped with water, while at the same time the 'names' of the dead are spoken." The first child born after the death of a member of a family is almost always called after him to procure peace for him in his grave. The name remains with the body or migrates through different animals until a child is called by it. If, therefore, this is neglected evil consequences may follow for the child who should have had that name. There is a similar notion in Norway that the dead seek after names. If, before her child is born, a woman dreams of a deceased relative, she must name her child after him or the child will suffer. The Lapps have the same superstition. The Koloshes in northwestern America think that the mother sees in a dream the departed relative whose soul gives the child its likeness. Among the Indians also the naming of children is made to depend on a dream.¹⁷

The name was of great interest and significance in North America. Names could be loaned, pawned, or even given or thrown away outright. On the other hand, they might be adopted without the consent of the owner out of revenge. The possession of a name was everywhere jealously guarded, and "it was considered discourteous or even insulting to address one directly by it." Personal names were given and changed at the critical epochs of life, such as birth, puberty, the first war-expedition, some notable feat, or elevation to chieftainship; and retirement from active life was marked by the adoption of the name of one's son.¹⁸ This and several subsequent cases illustrate the usage of tekonymy.¹⁹ Among the Iroquois, if captives succeeded in running the gantlet they were adopted into the tribe with a new name which was proclaimed at the next festival.²⁰ The child might be named soon after birth or not for a year or more later—this child-name, like the milk teeth, being discarded as the boy or girl grew up for another of more important significance.²¹ Names were sometimes the property of clans. Those bestowed on the individual members

and, as on the Northwest Coast, those given to canoes and to houses, were owned by families.²² The Indian, it should be noted, "regards his name, not as a mere label, but as a distinct part of his personality, just as much as are his eyes or his teeth, and believes that injury will result as surely from the malicious handling of his name as from a wound inflicted on any part of his physical organism. This belief was found among the various tribes from the Atlantic to the Pacific, and has occasioned a number of curious regulations in regard to the concealment and change of names. It may be on this account that both Powhatan and Pocahontas are known in history under assumed appellations, their true names having been concealed from the whites until the pseudonyms were too firmly established to be supplanted."²³

On the Northwest Coast a man adopted one of the sacred potlatch-names of his predecessor when he gave the mortuary feast and erected the grave-post. At every subsequent potlatch he was at liberty to adopt an additional title, either one used by his predecessor or a new one commemorative of an encounter with a supernatural being or of some success in war or feast-giving.²⁴ Among the Tsimshians each person acquired new names as his social position advanced in the course of his life; they were bestowed at a potlatch amidst much ceremony and feasting.²⁵ When the Kwakiutl first begin to perform the winter ceremonial, both men and women change their names. "Thus it is also with the guests of a chief who gives a feast with oil, a great oil feast. As soon as all the guests go into the house in which the oil feast is to be given, the speaker of the chief rises, and speaks, and calls the chiefs by their feast-names, those who have given an oil feast; but he does not call the names of those, even if they are head chiefs, who have not a feast-name. Then the chiefs are ashamed because their names have not been called. . . . When the feast is at an end, all the men go out, and then they have no longer their feast-names, but they are called by their potlatch-names after this, which are the true family names."²⁶ Names and all the privileges connected with them may be obtained by killing the owner of the name, either in war or by murder; the slayer has then the right to put his own successor in the place of his killed enemy. In this manner names and customs have often spread from tribe to tribe. Furthermore, among the Kwakiutl, if a man's credit is poor, he may pawn his name for a year, during which time he may not use it. He has to pay about twenty-five per cent for a three months' loan to redeem his name.²⁷ Mystic and secret names are common among the Indians of British Columbia. The young men of the Salish will not reveal their Indian names; "they seem, however, to have no such scruples about their baptismal names or those casually bestowed upon them by the whites, evidently regarding these as something quite different from their own."²⁸ Among the interior Salish, where there are no clans, names are usually inherited in both the male and female lines for several generations, though new names, taken from dreams or noteworthy events, are continually introduced. A father, among some of the northern Athapascan tribes, lost his name as soon as a male child was born and was henceforth called after the name of his son; in one case a man changed his name after the birth of each successive child, while an unmarried man was

known as the child of his favorite dog. A Mohave child born out of wedlock received some ancient name, not commonly employed in the tribe.²⁹ In the case of the Indians of the Oregon coast, when a child was born he was given a nickname. This he retained until puberty, when he received his regular name, which was ordinarily that of one of his ancestors on either side. He might take the name of a living man, although in that case the giver must assume another; the same name was never used by two living people.³⁰

Among the Attacapa, teknonymy is common: "a man ceases to bear his own name as soon as his wife bears a child to him, after which he is called the father of such and such a child, but . . . if the child dies the father again assumes his own name."³¹ The naming feast of the Winnebago tribe is described as follows: "The clan name was generally bestowed on a child at a special feast held for the purpose or at any feast that happened to be given within a reasonable time after its birth. The bestowal of the clan name was not infrequently delayed by a father's inability to gather the requisite amount of food to be presented to the old man who was to select the name. Occasionally it even happened that a father under such conditions permitted the relatives of his wife to bestow a name on a child, which of course was a name from its mother's clan. The author has personal knowledge of a case in which the first child of a man had a name belonging to his mother's clan while the other children had names belonging to their father's clan. When questioned, the man said that at the time of the birth of his eldest child he was too poor to pay for the honor of having his child receive a name and that he had allowed his wife's relatives to give it a name. When his other children were born, however, as he was in better condition financially he had been able to name them in the usual way. Although a child, irrespective of his individual name, always belonged to his father's clan, there seemed to exist a feeling that a person having a name not taken from his own clan was more or less incomplete. A person possessing no clan name was regarded as having low social standing."³²

Among the Cree, when a child is sickly, the doctor, upon investigation, may dream that it was wrongly named and prescribe a change. "If the diagnosis was correct, the child would recover in from a day to four days, and all was well." When a child is still young it is customary for the parents to call upon four old men and ask them to give it a name. "The parents gather a quantity of clothing and other presents, and a lot of food; then four old men, whom the parents have selected because of their fame for powerful dreams and for their war exploits, are invited by a runner who bears them tobacco and a pipe. Each tries to dream from then on, and when the appointed day arrives, the four men appear at the spot designated, where the parents have prepared a feast and where other guests are assembled. When all is in readiness, a pipe is filled and given to the spokesman of the elders, who rises and addresses the people. He tells them of whom or what he has been dreaming, and gives the infant a name that has some reference to his visions or to one of his adventures in war. He then turns to his three assistants and afterward to the people in general, asking each to repeat the name aloud and to call upon the namer's dream guardian to bless the child." In former times it was taboo to ask a man directly for his name, although it is now done very freely. The only time a man ever mentioned his own name was when he had done a brave

²⁹ Swanton, in HAI, II, 16.

³² Radin, in BAE, XXXVII, 128.

deed; on such an occasion he might repeat the story of his exploit to his friends, crying, for instance, "I am Kiwistaihu, and that is the way I am accustomed to do!"³³ In the scalp-dance of the eastern Dakota a man might throw away his name and take that of a dead warrior relative, giving presents to the poor at the same time. Children were named by their grandfathers for some deed done in war or after a famous ancestor. Guests were invited to a feast, after which the old person named the child, and a crier was sent out to announce it.³⁴ Sometimes the Menomini child receives its name from the parents, but if there is evidence of its being under the special protection of the powers above (a boy is under that of the "thunderers," a girl under that of the "sky-sisters"), it is considered already to have a name which has to be found out, often by the help of an old seer who understands the language of babies. "Such children lie under certain obligations towards their supernatural protectors; so, for instance, they have to play, at least once a year, a sacred game (lacrosse for the thunderers and shinney or dice game for the sky-sisters); and on the other hand, they have to be treated with special consideration lest they should get tired of their earthly existence. Besides their real name they have a so-called 'lucky name,' which is used only in the family circle, but which sometimes supplants the other."³⁵

Among the Guiana Indians there would appear to be an intimate relationship between an individual and his personal name of such nature that the very mention of it in his presence would be fraught with serious consequences. "The name is deemed to be part and parcel of the individual, and the mention of it under those circumstances would put him in the power, as it were, of the person mentioning it. It is kept strictly secret and is known only to the family relatives and friends and to the paiman. Even among family relatives, according to age and sex, one will address another as brother, sister, father, mother, son, or daughter, etc., or will speak of him or her as the father or mother, etc., of such an one. . . . One can never discover an Indian's real personal name; he never divulges it, nor is he ever called by it. He is also known by some nickname or name of distinction for his prowess in war, hunting, or fishing. Thus, the greatest demonstration of trust that an Indian can show a white man or Negro is to tell him his name."³⁶

What's in a name? The name, which we are accustomed to regard as something incidental, was in the view of the ancients an essential part of living creatures and inanimate objects through which their innermost essence was characterized and revealed. According to the Oriental idea, a thing had no existence until it was named.³⁷ The name of the deity was fetishistic: "The name of the God of Jacob defend thee"; "The name of the Lord is a strong tower; the righteous runneth into it, and is safe."³⁸ The Holy Scriptures etymologize with special predilection the names of persons and places and find an inner connection between the name and the bearer thereof. The Scriptures, moreover, pay homage to the tradition, which finds expression in a legion of popular etymologies, that *nomen est omen*. "As his name is, so is he."³⁹ Clay⁴⁰ compiled a list of more than ten thousand proper names occurring in the cuneiform literature of Babylonia and Assyria, especially during the period

40 *Personal Names from Cuneiform Inscriptions of the Cassite Period*.

1750-1173 B.C. He made a thorough study of these names, taken chiefly from business and legal documents, and found that a name at that time, as throughout early antiquity, was much more than a convenient appellation. It belonged to an individual as a part of his equipment and in many cases was regarded as too sacred to be used on all occasions, so that in addition to his real name an individual generally had some less solemn sobriquet by which he was known, often chosen to emphasize some physical peculiarity or distinction and invariably briefer than the real name used on official occasions. In most cases it formed a complete sentence with subject, object, and verb. An invariable element in the case of a person's full designation was the name of some deity, by the introduction of which the name became a prayer, or an expression of some hope, or praise of some deity. It obviously had fetishistic quality. "There are people living now, Celts for the most part, who shrink from the personal attack of a proper name, and call their friends, in true primitive fashion, the Old One, the Kind One, the Blackest One, and the like."⁴¹ In Brandenburg and elsewhere the name is cut out of the garment of a dying person so that he may depart this life more easily.⁴²

What may be regarded as a survival of the *nomen-omen* idea is reported in the newspapers of a few years ago. One Rex Glenwood of Cincinnati rescued a man named Edward Strietback from drowning. The latter was suffused with gratitude for his rescuer and wanted to do what he could for him. Whereupon Glenwood asked that he take his name. The name, it appeared, was hoodooed; but the bad luck was attached to the name only and not the individual. So Strietback manfully lived up to his promise, changed his name to Rex Glenwood, and apparently endured several years of hardship and misfortune. Eventually the hoodoo wore itself out. The real Glenwood is now convinced that the bad luck is over, so he wants his name back; and the substitute Glenwood apparently is glad to get rid of it.⁴³ Mary Antin⁴⁴ cites a similar superstition among the Jews of Russia: "My mother nearly died of cholera once, but she was given a new name, a lucky one, which saved her; and that was when she was a small girl."

§§213, 214. Location of the Soul.

ONE of the many places primitive people have hit upon as the seat of the soul is the heart. When, in 1823, Sir Charles McCarthy was captured by the Ashantis and beheaded, his heart was made a feast of by the chiefs then present at the capital.¹ They devoured the heart of the lion-hearted as they did the heart of the lion. Such beliefs about the heart are widespread and traditional. "Captain Wells fought so bravely that after his death the Indians cut out his heart and ate it, which was the greatest compliment they could pay him."²

The Chukchi believe the soul resides in the heart or the liver. It may be in both, for these people believe in multiple souls. Various parts of the body have souls; there is a limb-soul and a nose-soul; and when a man's nose is easily frost-bitten they say he is "short of souls."³ The Caribs, who also believed in several souls, located one of them in the heart, another in the head,

and other souls at all the places where an artery is felt pulsating.⁴ Allied to the notion of the soul in the heart is that which places it in the blood, an idea found in a number of instances.⁵

The soul is also located in other vital organs. The South Australians "feel from their liver, not from their heart as we do;"⁶ and the Greeks felt anger in that organ and also identified it with personality.⁷ The Eskimo regard the bladder as the seat of life, though it is not the sole receptacle of the spirit. They often gave little boys the kidneys of bears to eat in order that they may become stout and courageous bear-hunters.⁸ Certain Africans locate the seat of feeling in the belly,⁹ as is true also of the Bina in Papua, who will express grief by saying that his belly is sore. Similarly, he will "think along his belly."¹⁰ The Tahitians, holding similar views, use the word bowels as we use heart.¹¹ Other Polynesians regard the belly or womb as the seat of life and feeling, the word they use acquiring a secondary sense signifying "the interior man," "the breath," or spirit. They have a symbol consisting of abdominal protuberance, with the hands usually resting upon the abdomen; "this represents the soul and stands for the immortality or rather the longevity of the gods and of the early ancestors of man."¹² In the South Sea Islands thoughts are called "words in the belly" in the translation of the natives.¹³ It is to be noted that we still speak of "bowels of mercy," and refer to one who "has no bowels;" indeed, the shorter and uglier term is current.

A not less important seat of life, according to Semitic ideas, lay in the viscera, especially in the kidneys and liver, which in the Semitic dialects are continually named as the seats of emotions, or more broadly in the fat of the omentum (intestinal membrane) and the organs that lie in or near it. "Now it is precisely this part of the victim, the fat of the omentum with the kidneys and the lobe of the liver, which the Hebrews were forbidden to eat, and, in the case of sacrifice, burned on the altar. . . . From this complex of fat parts the fat of the kidneys is particularly selected by the Arabs, and by most savages, as the special seat of life. One says, 'I found him with his kidney fat,' meaning I found him brisk and all alive."¹⁴ The Australians are at one with the Semites in this belief that the soul is in the fat and soft parts of the body,¹⁵ and Smith explains that the various kinds of fat, especially human fat, are used as charms all over the world, the reason being "that the fat, as a special seat of life, is a vehicle of the living virtue of the being from which it is taken." Most gods are found to rejoice in "the smell of burning grease."

The ancient Greeks made much of the diaphragm as the seat of feeling and mentality.¹⁶ "They have shut up their midriff"¹⁷ means that they are insensible to pity. The region of the diaphragm or midriff (pit of the stomach, solar plexus) is a spot where a blow produces characteristic effects; it "knocks the breath" out of the victim, or "puts him to sleep." Even among the Chinese the

value of different parts of the human body, as reservoirs of diverse qualities and strengths, was recognized.¹⁸ Some American Indians located the soul in the bones, as well as in the blood, the shadow, and the nape of the neck; the words for bones and soul are sometimes found to be cognate. At times the natives paint the bones and think they may put on flesh again.¹⁹ In some cases they burn the bones of the dead and drink the ashes, mixed with intoxicating liquors, in order "that the dead may live again in them."²⁰ A later section on cannibalism²¹ will reveal further beliefs concerning the location of the soul.

Another common location of the soul is in the head. Among the Melanesians "it is disrespectful at all times for a young man to take anything from above an elder man's head, for there is something naturally sacred, *rongo*, about the head, and no one will take the liberty of stepping over the legs of any but a brother or intimate friend."²² In the Indian Archipelago the seat of the soul is thought to be in the head, and when a body is buried a coconut is used instead of the head, the natives saying, "We have given you a new head," meaning "Go along now and cease complaining."²³ Among the Yakuts *kut* is a physical conception of the soul, while *sür*, although in some degree a material conception, has more of a psychical character. *Sür* is connected with the head, and has no shadow; *kut* with the abdomen, and has three shadows. The word *sür* is also used to denote unusual psychic powers, such as are possessed by shamans; and, indeed, according to the legend, shamans receive their heads (the seat of *sür*) from heaven.²⁴

If the soul is not located in the head generally, it may be in some part of it. Thus, although cannibalism is not practised by the Dyaks, a man who has taken a head sometimes eats a small piece from the cheek, in the hope of acquiring the bravery and virtues of the man killed.²⁵ In North Queensland, the seat of intelligence and life is located in the ear, and at death they escape through this exit; "hence, by shouting into the deceased's ears his friends are trying to restore these essentials to their proper place."²⁶ More commonly is the soul in the eye. While some tribes in Dutch New Guinea locate it in the blood and others in the abdomen, there are some who place it in the eye; all believe that after death the soul as spirit causes all good and evil, mostly the latter.²⁷ The Maori also thought the soul was in the eye, especially the left eye, and cases occurred where a chief drank the blood and ate the eye of his vanquished rival "that he might incorporate the qualities wherewith the vanquished man was endowed, and by assimilating his shadow, duplicate his own soul."²⁸ The Arawak believe in a soul which they explain flies away at the time of death, for then they can no longer see the reflection of a person in the pupil of the eye.²⁹ Other cases of this sort are to be found, while the evil-eye conception is evidence of the same belief.³⁰

The idea that the soul or vital power of a person is concentrated in his head, and particularly in his hair, seems to be common to all lower people in the whole world and gives the explanation not only of a number of peculiar

hair-customs but first of all of the practice, existing among some savage tribes, of taking the scalps of slain enemies or preparing their heads as trophies. The use which the Jibaros, like other Indians, make of the heads of their enemies and the ceremonies which they perform with them are throughout founded upon this idea. "The power which the Jibaros attribute to the cincture made of human hair depends on the supernatural properties ascribed to the hair, which is regarded as the seat of the soul or the vital energy."³¹ "Years ago, when I was living in Taveta, in British East Africa, Malikanoi, one of the two paramount chiefs of the Wataveta, wore a shock of unusually long, unkempt hair. He was supposed to be a magician, and his subjects believed that his occult powers, like those of Samson as an athlete, lay in his hair. As he dressed, besides, in nondescript old discolored European garments, his appearance could not be called either prepossessing or dignified. As the time came near when his son—a splendid lad, who, at the age of sixteen, had killed a lion single-handed with his spear—was to come of age, Malikanoi announced that, in honor of the occasion, he would shave off his hair."³² The Baganda child's hair must not be cut until it has been named, and "should any of it be rubbed or plucked off accidentally, it is refastened to the child's head either by tying it with string or knotting it to the other hair."³³ Wilken³⁴ has much to say about the hair-sacrifice and other practices which point to the notion that the soul is in the hair or has some vital connection with the hair, especially that of the head. In part he thinks it is connected with the custom of cutting the body in order to let the soul loose. The Kalmuk priest before burial cuts open the skin of the corpse so as to facilitate the exit of the soul. Monier-Williams³⁵ reports a similar practice from India: "When the body is half-burnt the skull ought to be cracked with a blow from a piece of sacred wood. The idea is that the soul may not have been able to escape through the aperture at the top of the head, and that the cracking of the skull may open a crevice and facilitate its exit. In the case of the death of a holy man whose body is buried and not burnt, the necessary blow is given with a cocoa-nut or with a sacred conchshell. A story was told me with great seriousness of a sorcerer at Lahore who made it the business of his life to make a collection of the skulls of dead men which had not been properly cracked in this manner at death and so retained the spirits of the deceased inside. The peasantry in the neighbourhood fully believed that he was able to make use of these spirits for magical purposes, and that he could force them to execute his behests." Wilken (as above) cites parallel cases from the Indian Archipelago and elsewhere and shows that in some places the same result is thought to follow by cutting off the hair of the deceased. The sacrifice of the hair he regards as a redemption-form of human sacrifice. He cites many legends and beliefs of savages and peoples of early civilization to the effect that the hair is closely connected with life, the loss of one meaning the loss of the other, or at least the loss of strength. And Samson said, "If I be shaven, then my strength will go from me, and I shall become weak, and be like any other man."³⁶ In some folk-tales spirits become defenseless when seized by the hair or beard. Some

groups believe that if a criminal is apprehended and tortured, he can endure all pain so long as he remains in possession of his hair; if that should be cut off, with it would go his secret strength. The mythologies of classical peoples relate tales of persons who are invincible and immortal owing to their hair.

Plurality of Souls. Instances of belief in several souls have already appeared. To the Siberian cases may be added that of the Gilyak who believe that an ordinary man has one soul, a rich man two, while a shaman may have as many as four. "Besides these principal souls, every one has a lesser soul, which they imagine as being like an egg, residing in the head of the principal soul. All that a man sees in dreams is the work of this lesser soul."³⁷ Many Malays believe a person has seven souls.³⁸ Belief in the plurality of souls is common in the Indian Archipelago and is one reason for wounding or cutting the body in many places, to free the various souls from the body of the deceased.³⁹

Among some Eskimo the name is considered as one of the souls of man, another soul belongs to the body, and a third one is independent of the body. The central Eskimo suppose two spirits to reside in a man's body, one of which stays with it when it dies and may temporarily enter the body of some child, who is then named after the departed, while the other goes to one of several lands of the souls.⁴⁰ The Hidatsa and the Fraser River tribes of British Columbia believe in several souls, "the loss of one of which causes partial loss of life, i.e., sickness, while the loss of all, or of the principal one, entails death."⁴¹ The Northwest Coast Indians hold that an individual comprises a body inhabited by two souls and a ghost. "In a slight illness the outer soul becomes separated from the body, in a serious illness the inner soul wanders to the country of souls but may be recalled by the shaman."⁴² The Quileutes assert that each human being, animal, and inanimate object possesses a plurality of souls which, upon the termination of the visible existence of their owners, go to the Country of the Souls. These souls or shadows look exactly like the living being and may be taken off or put on in exactly the same manner as a snake sheds its skin. "The outside shadow leaves a person, as soon as he becomes sick, the inner soul departs a day or two before his death; and the ghost leaves the body at the very moment when death sets in. Death can occur only after the departure of either the inner soul or of the ghost; the loss of the outer soul does not necessarily involve death. In other words, the Quileute Indian regards sickness as a result of the departure of a person's outside soul; while death is caused by the loss of the inner soul or of the ghost."⁴³ The Cree say there are two kinds of souls: one which stays behind with the corpse in the grave, and another which goes to the hereafter. "The first, when seen, resembles blue fire; it is the sort that haunts folks. The second can sometimes be heard to cry out; it whistles like a gopher (a small burrowing rodent of the prairie that has a shrill call). When the northern lights are seen the Cree think them the spirits dancing in the hereafter."⁴⁴

All Things Have Souls (§214). Not only has man at least one soul, but animals and plants and other objects have souls as well. Taro, sweet potatoes, and ba-

nanas have each a separate soul answering to the human soul, though apart from these, trees and inanimate objects are not considered to possess a life like the life of men and birds. "Should a tree fall unexpectedly near some native, it is a spirit or a sorcerer who is trying to kill him; if a canoe breaks up and a man is drowned, the cause is probably the incantation of some enemy."⁴⁵ In the Trobriand Islands all of a man's valuables, but especially his ceremonial axe-blades, are put on his body when buried. "The spirit is supposed to carry these away with him to Tuma—in their 'spiritual' aspect, of course. As the natives explain simply and exactly: 'As the man's *baloma* goes away and his body remains, so the *baloma* of the jewels and axe-blades go away to Tuma, though the objects remain."⁴⁶ The Tshi-speaking negro does not confine the possession of a ghost, or soul, to man, but extends it to all objects, inanimate as well as animate; and, "acting logically upon this belief, he releases these ghosts, or souls, from their material parts, for the use of ghost-men in Dead-land. At the death of the chief he buries with the corpse, weapons, utensils, food, gold-dust, and cloth, for the use of the ghost-chief; just as he cuts the throats of the chief's wives and slaves in order that their ghosts or souls may be released from their bodies, and enabled to continue their attendance upon their lord in Dead-land." Not only in Dead-land does the ghost-man live in a ghost-house and use the ghosts of such implements as have been placed at his disposal; but "Dead-land itself, its mountains, forests, and rivers are, the Tshi-speaking negro holds, the ghosts of similar natural features which formerly existed in the world. The trees, as they die in the earthly forest, go and join the ranks of the shadowy forest in Dead-land."⁴⁷

In the view of the Koryak of Siberia "there is still a living, anthropomorphic essence concealed under the visible inanimate appearance of objects. Household utensils, implements, parts of the house, the chamber-vessel, and even excrement, have an existence of their own. All the household effects act as guardians of the family to which they belong. They may warn their masters of danger, and attack their enemies. Even such things as the voice of an animal, sounds of the drum, and human speech, have an existence independent of the objects that produce them."⁴⁸ "The Japanese firmly believe that the pearl oyster has a soul. . . . One of the largest pearl firms in Japan has constructed a miniature pagoda in the Grand Imperial Shrine of Isé, using more than 10,000 pearls. This monument to oyster souls will be dedicated this month [Sept., 1926] with a public Buddhist mass." In Kobe, in a recent campaign against hydrophobia, about 5,800 wild dogs were put to death. "After the extermination of the unclaimed and unlicensed animals a special mass was held in their honor at the temple . . . which was attended by thirty Buddhist priests and numerous other officials." The Lolos of West China believe that the growing crops and the cattle of the farm are endowed with souls. When the rice is poor in growth, the soul of the crops is entreated by a ritual, a sort of litany, to return.⁴⁹ Similarly believe the Dusuns, for a native took Evans⁵⁰ on several occasions into his rice-store, "where were hanging up the rice-souls of former crops; for, contrary to the custom of many peoples who take the rice-soul, it appears that the Dusuns do not mix it with the seed for the next sowing." The

same author reports that even manufactured articles may have souls, "for a Sakai . . . told me that blow-pipes and other articles, which are placed on graves, are purposely broken. This is evidently done with the object of setting free the souls of the offerings for the use of the spirits of the dead; indeed the Sakai himself, when questioned as to the reason for this custom, replied that a blow-pipe which was intact would appear to the spirit to be broken, while if it were broken it would seem to be intact."⁵¹ A Palaung child is taught to be polite to any pot or dish in which food is cooked or served; "if such a utensil be accidentally broken, the person who has broken it, while carefully picking up the broken pieces, says: 'I am sorry that I broke thee. It was an accident; I did not intend to break thee.' The broken pieces must be carried out of the house—not thrown out or swept out—and placed gently upon the ground. The first time that a pot is used, it is polite to say to it, 'Please be a pot of gold or silver for me.'⁵² From the Malay point of view, tin-ore is endued with vitality and the power of growth. Its spirit can assume the form of a buffalo and move underground from place to place. Certain words, such as elephant, buffalo, cat, snake, tin, the use of which would offend the spirit, are tabooed. As the spirits dislike noise, all eating-vessels should be of coconut-shell or of wood. No animal must be killed in a mine. The miner must wear trousers; yet it is forbidden to wear shoes or to carry an umbrella or to wear a sarong (Malay skirt) in a mine.⁵³ It is also believed that trees have souls, which belief is in evidence when the native, tapping for palm-wine, tries to stimulate their sex-passion by imitative magic.⁵⁴

The Hudson Bay Eskimo believe that everything in the world has its attendant spirit. The spirits of the lower animals are like those of men, but of an inferior order. "As these spirits of course cannot be destroyed by killing the animals, the Eskimo believe that no amount of slaughter can really decrease the numbers of the game."⁵⁵ The principal element in the Bororo religion is the same as that found among the other South American Indians—fear of evil spirits, the spirits of the dead. "Only men, horses, parrots, and dogs possess immortal souls, the other animals and plants having souls that are freed through use and afterwards become mortal."⁵⁶ That trees are animate, and have perceptions, passions, and a reasonable soul, was argued even by the early Greek philosophers on such evidence as their movements in the wind and the elasticity of their branches.⁵⁷

§217. The Ghost-Status.

THE natives of Victoria think that the soul lingers three days around the corpse, and then goes into a beautiful country full of kangaroos and other game.¹ The Solomon Islanders invoked and sacrificed to the souls of their dead ancestors, that is, to ghosts in the sense of disembodied spirits. "The people clearly distinguish in their minds between a spirit [a being that has never been a man] and a ghost, but they have no words to express the two conceptions, their language in this respect being no better than English."² Among the Koita the word *sua* means ghost or shade, and when a man dies his *sua* goes to

Idu, where it lives for an unknown period, longer than the life of man, but at length it weakens and ceases to exist. Perhaps the period of their existence is the time during which their memory or the memory of their names is retained on earth, for some Gaile men discussing this subject suggested that when their names were lost, they also must have vanished. The habits and amusements of the *sua* on Idu are those of mankind." Among the Roro-speaking tribes the term for the spirit or ghost of a dead man is *tsirama* which is used precisely as the Koita use the term *sua*. "*Tsirama* are considered to frequent the villages of their people; if they deserted the village, the inhabitants would have no luck in anything, and it was stated that if the *tsirama* are suspected of having left a village, measures are taken to bring them back." It was principally fear of *tsirama* that prevented any native leaving the village after dark unless accompanied by a companion, even if he desired to go only a few yards. An "evil spirit like fire" was said to intercept the *tsirama* on its way to the other world, to ask if its ears and nose had been pierced during life.³ On its journey to the land of spirits, so believe the natives of Moresby Strait, the ghost has the form, now of a fish, now of a butterfly, for it changes from one to the other as often as it grows tired. "In the daytime it resembles wood, but at night it wanders about, casting no shadow."⁴ A remarkable thing happens to the spirit immediately after its exodus from the body, according to notions held in the Trobriand Islands. "Broadly speaking, it may be described as a kind of splitting up. In fact, there are two beliefs, which, being obviously incompatible, yet exist side by side. One of them is, that the *baloma* (which is the main form of the dead man's spirit) goes 'to Tuma, a small island lying some ten miles to the north-west of the Trobriands.' . . . The other belief affirms that the spirit leads a short and precarious existence after death near the village, and about the usual haunts of the dead man, such as his garden, or the sea-beach, or the waterhole. In this form, the spirit is called *kosi*." The connection between *kosi* and the *baloma* is not very clear, and the natives do not trouble to reconcile any inconsistencies with regard to this matter. The two beliefs exist side by side in dogmatic strength; "they are known to be true, and they influence the actions of men and regulate their behaviour; thus the people are genuinely, though not very deeply, frightened of the *kosi*, and some of the actions observed in mourning, and the disposal of the dead, imply belief in the spirit's journey to Tuma, with some of its details." In the minds of these natives "there is not the slightest doubt that a *baloma* retains the semblance of the man he represents, so that if you see the *baloma*, you recognize the man that was. The *baloma* live the life of man; they get older; they eat, sleep, love, both whilst in Tuma and on visits which they pay to their villages." The only almost general tenet concerning the *baloma* and *kosi* is that the former are like reflections, the latter like shadows. "It is noteworthy that this double simile corresponds respectively to the open, defined, permanent nature of the *baloma* and to the vague, precarious, nocturnal character of the *kosi*."⁵ The interval of sojourn of the ghost, in the Gilbert Islands, is either three or nine days; the body was kept for one or the other period, being buried on the fourth or tenth day, as the case might be. "Those who kept it for the shorter period were of the opinion that, as the soul had finally been driven from its neigh-

3 Seligmann, *Melanesians*, 189-190, 309-310.

5 Malinowski, in JAI, XLVI, 354-355, 368.

bourhood on the third repetition of the *bo-maki* ceremony, it might safely be laid to rest on the fourth day. But many families . . . believed that the soul might reinhabit the body at any time during the nine days after death."⁶

In several places on the west coast of Africa the soul of the dead is believed to require nine days to come to the place of rest.⁷ What becomes of the soul at the moment of death? This question was answered by a Fan priest as follows: "I believe the soul continues to reside, alive, in the corpse, with the possibility of disengaging itself from it, not freely and in the open, but associated with something indeterminate, impalpable, a sort of phantom or specter, which has the exact appearance of the deceased body but none of its reality. It is in this death-form, which is in short the body incorporeal, that the soul will live henceforth in the region of the dead. For us Blacks, the soul is an essence distinct from the body and endowed with a more subtle nature but unable to subsist alone, independently of any phantom. This phantom does not always have the exact form of a human body: those unfortunates whose flesh has served for cannibal feasts (and they are numerous) will have the appearance of desiccated skeletons; those whose bodies have been reduced to ashes will forever have the form of a little smoke mingled with some ashes."⁸ How such African beliefs lead to idolism is explained by Frobenius⁹ who says, "The questions in which the negroes are especially interested all culminate in inquiry concerning the influence and activity of the dead, whose intervention in daily life they observe in every unusual occurrence and in all striking peculiarities." The Baganda believe that every one has a soul which at death leaves the body and is then called the *muzimu*, ghost. "In this state it continues to exist and is capable of doing good or harm to the living; it is supposed to be capable of suffering cold, hunger, and pain." When the ghost leaves a man it goes to the place of the departed, to give an account to the deity of death; it then takes up its abode in the hut built by the relatives for its reception, either near the grave in the family burial-ground or near the enclosure of the relatives. "The ghost cannot be seen—it is like the wind; in fact, the gentle rustling of the plantain leaves is said to be caused by the ghosts, and a whirlwind which carries up dust, leaves, and straws is said to be the ghosts at play, so that whilst the ghost is invisible, the effect and influence of its presence are seen upon human beings and vegetable life. Ghosts can be captured and put to death either by fire or drowning."¹⁰

The Samoyeds of Siberia have a custom which requires the wife of a dead man to make a figure which represents her husband, from portions of the boat, skis, and branches. "This figure, which is dressed and adorned like the deceased, and whose features even are sometimes made by a careful widow to resemble him, is treated as the husband for six months after the death; it is placed in the most important seat, is fed by and sleeps beside the wife." The Buryats believe that the soul of a dead man acquires new qualities: "It is visible to the living, but leaves no tracks on the ashes of the hearth and passes noiselessly over dead leaves; it can be killed, and it then takes the form of a pelvis, but it has the power to become a soul again after three days unless prevented by a slight burning of the pelvis."¹¹ Another tribe celebrates a memorial for the

dead on the fortieth day after the funeral.¹² Among the Palaungs one soul alone can hardly make any sound, "but when a number meet together, as when there is an epidemic, and many people die at the same time, their ghosts meeting together and talking make a faint humming sound high up in the air."¹³

The Eskimo believe that the souls of the deceased stay with the body three days.¹⁴ The ghost of a person, the Quileute Indians affirm, is a trifle longer than the rest of the body, extending somewhat beyond the toes and above the head; it "leaves the body simultaneously with the setting in of death and goes directly to the underworld where it joins the two souls. . . . The ghosts sometimes come up from the underworld causing sickness among the living relatives so that these may die and join them. Occasionally they merely visit their former habitations. On all of these trips they are usually accompanied by the two souls. Ghosts travel at night only and may be heard whistling, which is their form of singing. For that reason the Quileute are forbidden to whistle at night, because it is feared this might attract a ghost to a whistling person. Ghosts never like to come up close to the village, for the smell of living beings is repugnant to them. . . . The ghost has the form of a human being and is provided with hands, feet, eyes, nose, etc. His body is covered all over with moss, including the face, mouth, hair, and hands. His nose is long and hangs down as far as the chin; his eyes are large, round, and of a yellow color; he walks crooked, crossing and recrossing his legs at each step and can run very fast. He eats and drinks just like a human being. One of my informants claims to have seen a ghost during a trip to the underworld. He could not come close to him, however, for the ghost disappeared as soon as he became aware of the intruder."¹⁵ Ghosts are greatly feared by the Cheyenne Indians. "As a rule these do not seem to work much actual harm, but they come about and whistle and frighten people. . . . People who are walking through the timber at night are likely to sing loudly, or to utter loud calls, to frighten away the ghosts; and generally when the ghosts show that they are near at hand, anyone who possesses spiritual power will sing a medicine song to drive them away. . . . The ghost of a person is called *si'yühk*, which appears to mean rather the skeleton of a person. A pile of human bones would be called *siyuhk*. Some people declare that it is the *siyuhk* that taps on the lodge-skins, whistles down the smoke-hole, and makes queer noises near the lodge."¹⁶ Among the Omahas too, "the restless ghosts were supposed to whistle and for this reason children were easily frightened by whistling."¹⁷ Among the Araucanians the *Am* or ghosts of the dead, who appeared to the living, were distinguished from the *Pilli*, the souls of the living. "They also believe that their chiefs returned to visit the haunts of their relatives in the form of humble-bees. All their trials and adversities, even the most trivial, were set down to the malignity of evil spirits."¹⁸

Among the ancient Egyptians the *ka* of the dead, his double or second self, a kind of ethereal body which nevertheless needs food and drink in order to live, lingers in the grave or dwells with Osiris in the fields, where it must work hard; or it travels through the regions of the dead in struggle with monsters and demons, conquering through the magic power of the word, then to emerge

with the sun as a celestial being; or it goes about as a phantom, or becomes a soul represented as a bird with human head, at the death of which it passes away to become united with the body. All these contradictory views were firmly held side by side.¹⁹ In old Roman religion all notions of death and lower world unite in the vague idea of *di manes* or, as they are euphemistically called, good gods, which does not mean definite divine persons but *di inferi*, the mass of divinities which work in the realms of the dead, indeterminate in number and character. They appear whenever death festivals occur and the infernals are invoked. The *lemures* in historical times were *larvæ*, nightly wandering souls of dead relatives. To keep them from the house, at the Lemuria, in May, the house-father nine times scatters beans as a sacrifice to them. The notion of *di manes* as the souls of the dead raised to be gods and as confined to particular families and persons is foreign to old Roman religion; it begins in imperial times and finds expression in grave-inscriptions.²⁰

§218. Mortuary Practices.

THE possessions of the deceased, among some Australians, are placed on the grave, while the arrangement of the grave may indicate something concerning the deceased; water-vessels on it may denote that a woman is there buried and the perforations of the vessels that she has been speared.¹ Among the Tasmanians "during the whole of the first night after the death of one of their tribe they will sit round the body, using rapidly a low, continuous wail or recitation to prevent the evil spirit from taking it away."² In the treatment of corpses in the Pacific Islands, the prevailing idea is that of consecrating the corpse, which is taboo, by means of the nearness of the soul. "The desired union with the soul, which had been accepted amongst the gods, was found most easily in the neighborhood of the corpse."³ In one part of British New Guinea "the corpse was formerly placed on a platform over a smoking fire, incisions were made to aid the escape of fluid, which, as it fell, was, in some cases, rubbed into the bodies of the mourners. Later the smoke-dried corpse was wrapped in bark-cloth and kept on a platform until certain rites were performed, when it was buried in the village within a small fenced enclosure under a roof of palm leaves;" in another section, "the body was allowed to dry in the sun and mourners stood beneath and anointed themselves with the fat which dropped from it. The skulls were afterwards kept in the houses, and on feasting occasions, painted and decorated as in life, were held by dancers during the ceremonies."⁴ Both practices indicate that the soul is in close connection with the corpse.

In West Africa, burial-customs have undergone considerable change in recent years; in former times it was the practice to sacrifice one or more slaves at the funeral-ceremonies of a man who had attained a certain status. The rites of burial vary according to the age, sex, and importance of the deceased; more sacrifices are necessary for a man who is married and has children than for a young man who has not taken a wife. A woman who dies in pregnancy is not buried in the ordinary way; at Nibo, after a post-mortem Cæsarian operation has been performed, the woman is buried but not the child.

3 Ratzel, *Vhde.*, II, 334.

4 Chinnery, in *JAI*, XLIX, 282.

There are also certain diseases which render patients incapable of being buried in the ordinary way, for there is an idea that the disembodied spirit partakes of the nature of the body. "A man suffering from elephantiasis is not allowed to die in the house, but is removed to the farm, and sometimes simply exposed after death; in some cases a surgical operation is performed after death to remove the enlarged part, and then he may be brought home and buried in the ordinary way. Smallpox, dropsy, syphilis, leprosy, and a sort of cholera known as itolo, disqualify the sufferers from dying in the house and being buried in the ordinary way; at most they will be covered with leaves in a shallow grave. Second burial may, however, in many cases, be performed."⁵ Burial is not the common manner of disposing of corpses in East Africa. Important elders and their senior wives, and also medicine-men, are buried; corpses of other persons are thrown out into the bush.⁶ When a man or woman is mortally sick among the Suk of Kenya, the relatives collect a number of elders to perform what is to all intents a litany. An elder stands up while all the others cower; he declaims ahead of the congregation, "He will not die," "He shall live," "He will eat to-day." In case of death, adults are buried; the bodies of small children are thrown into the bush, while the father shaves the forelock and the mother the sides of the head.⁷

The tribes of the Altai Mountains, Central Asia, think that the soul cannot at once understand that it has left the body, and learns this only after three days, when it observes that its feet no longer leave impressions in the ashes. The Buryats have a similar notion.⁸ De Groot⁹ cites illustrations from Chinese literature of the belief that the grave is inhabited by the soul of the dead man who lies therein. Among the Nagas, "when the corpse has been placed in the burying ground it is the duty of the eldest brother or the nearest relative to remain near by and repeatedly shout the name of the deceased; when he is exhausted, the next nearest relative takes up the task."¹⁰ The Kubus of Sumatra believe that the souls of their relatives hover as ghosts about the place where their bones rest.¹¹

When a Winnebago dies, some person is invited to talk to him before he is buried. The person addressing the dead man or woman tells the deceased how to go to the spirit-land and what to do on the way there. For four nights a burning ember is placed on the grave, which "is supposed to be taken by the spirit of the dead man on his journey."¹² The custom of lighting fires on the grave for four nights after burial was common to most Algonquian tribes; the reason for the practice elsewhere is described as follows: "A fire is kept burning for four days, during which time the spirit is on its journey eastward to the land of the dead up above where the Sun is. There are four souls, but only one passes on to the future life, having as a finale to pass an obstacle at the entrance to the sky. If this point is passed in safety the journey is over, otherwise it returns to earth a menace to the happiness of the living."¹³ Burial was a common practice among the Indians and objects of value were often strewn over the grave; it was a general belief among some tribes that the spirit often returns to visit the grave, so long as the body is not reduced to dust.¹⁴

Among the Zuni and other tribes, "while a person is dying food is cast for him on the fire and food is put into his mouth—because it is the last meal." The corpse is straightway placed with the head to the east," the idea being that thus the deceased faces the spirit-world, the journey to which takes four days. "Zuni will not go to sleep, we may note, thus orientated. A child falling asleep careless of this rule will be asked 'Why do you wish to sleep like a dead person?'" The dead are fed elaborately on All Souls' Day, but it is a daily practice to drop or crumble a bit of bread at each meal or to put it on the fire.¹⁵ In Cayenne, on a death, "the men, women, friends, and children assemble and weep, or rather sing; the singing is done mostly by the nearest female relatives who, sitting on their heels, slowly pass both hands over the corpse from head to foot, while reproaching him for having let himself die. 'Is it because you were not happy with us?' say some. 'What have we done for you to leave us like this?' say others. They add: 'You were such a good hunter, too! You caught fish and crabs so well! You knew how to make a proper provision-field.'" ¹⁶ The Jibaro believe that the soul of an Indian killed with the lance flees in terror far away from the mutilated body and for some time does not remain in the neighborhood, as is believed to be the case at ordinary death.¹⁷

It was held by the ancient Greeks that the disembodied spirit still clung to the body which it formerly inhabited, and on the third and ninth day after the funeral they placed a meal on the grave.¹⁸ Among the Bulgarians messages and requests are given to a corpse for the dead whom he will meet in the Beyond. The deceased is addressed as if he were alive.¹⁹ Among the Montenegrins an elder calls aloud on the deceased by name; he hails him loudly and pauses for a reply. "Then, after a long silence, the whole lot shout together, 'Goodbye, brother,' and turn away from the grave."²⁰

§219. Disposition of the Ghost.

DAWSON¹ holds that "before the minds of the aborigines were poisoned by the superstitions of the white people, they had not the slightest dread of the dead body of a friend, nor had they any repugnance to remain beside it." If this is true, it is highly exceptional. CURR² states that a man's ghost is accredited with all sorts of powers which the person himself did not possess whilst alive, but only the ghosts of men lately dead are feared. In the Solomons, "men who fall from trees and women who die in childbirth are 'evil spirits.' Their names may not be mentioned and if we came to one in the pedigrees he or she is described as 'an evil spirit.'" The former type cause the living to fall from trees when they are gathering nuts; the latter cause other women to die in the same way.³ The rôle of the Trobriand ghosts is said to be purely passive, these people lacking a determinate ghost-cult; but out of this passivity they can be roused by being put into bad humor, "when they begin to show their existence in a negative manner, so to speak."⁴ The Koita hold that the *sua* or ghosts of recently dead folk would punish any neglect or infringement of their funeral rites; that they especially frequent the neighborhood of their homes is the

chief reason for the ceremonial desertion of houses in which a death had occurred. "A dead man's *sua*, it was admitted, would not hurt a relative unless something was done to annoy it, but even a son who did not show proper zeal for his father's funeral rites would be punished, while any infringement of tribal custom might determine the *sua* to smite the offender with sickness, or bring bad luck in hunting or fishing. . . . Certain *sua* are, however, quite harmless and no notice is taken of them. They appear to be the *sua* of the forgotten dead who are thought to haunt the bush, and cause only the slightest annoyance to the living. . . . They are absolutely harmless, nevertheless the living feel afraid when they see them."⁵

The South Africans believe that ghosts cause unaccountable illness and especially mental troubles; they seem unable to do good.⁶ One of Livingstone's men "on experiencing a headache, said, with a sad and thoughtful countenance, 'My father is scolding me because I do not give him any of the food I eat.'"⁷ The spirits of the dead are adjured at a Madagascar burial: "This is what you get, but you must not follow after his progeny, his grandchildren, his brothers; this is the one you have got."⁸ In West Africa, while the ghosts may be well disposed, yet their touch is dangerous; "if the children are ill, the illness is ascribed to the spirit of the deceased mother having embraced them." Such "touching," it is explained, "comes not from malevolence, but from loneliness and the desire to have their company." It is customary for the living to send the dead out ahead of an army, to bear the brunt in the first attack.⁹ Ghosts of Togo murderers, poisoners, and sorcerers, having had no death-feast, wander as malignant spirits,¹⁰ while on the Loango Coast if the soul is cheated of any of the cloth used to wrap up the corpse, it will return out of the grave and do mischief.¹¹ If a Bakoko had many enemies during his life, who did him much harm, after death he would change himself into a specter and take revenge on them, cudgeling and tormenting them and playing all sorts of mean tricks.¹²

In East Africa "the spirits are mostly malignant, and either out of revenge or cupidity they plague people, particularly those of their own family. They constantly require appeasing, and they also require attention in order that their wrath should not be incurred. Attending to all these demands of theirs is the religious cult of the Mkamba and his religion is thus a spirit religion."¹³ Among the Baganda, "the ghost of a father or grandfather is a guardian spirit, and the ghost of an aunt generally an evilly disposed one; the ghost of an aunt frequently kills children and brings various sicknesses upon wives. When an evil ghost takes possession of a person, which sometimes happens, it causes abdominal pains and swellings; to drive it out herbs are burned by the medicine man and the patient inhales the smoke, which is offensive to the ghost, and causes it to release its victim."¹⁴ The Nigerians think the spirits are always hungry and thirsty, and unless looked after will soon punish their relatives left alive on earth. It is lucky when the ghost is born again in the body of some descendant, as observed through the likeness of a child to his parents or grandparents, "for the ghost has returned, and has no longer any

power to frighten the relatives until the new body dies, and it is free again."¹⁵ The Niam-Niam "spoke with high respect of their dead fathers, but this came in part from an indefinite fear of harm that the dissatisfied or angry ghost could do them."¹⁶ The son "cannot cut his nails or his hair without his father's eye being upon him, and if he should fail to bury such clippings, he may expect to be reminded of it in a most unpleasant manner."¹⁷

According to some Siberian traditions, *ada* are souls of wicked persons or of women who have died childless. "No sacrifices are made to them and they are represented as one-eyed, evil, malicious spirits, who always remain in the same *ulus* or house. . . . They are afraid of being seen, of angry men, of fire, of metals, of weapons, and of the smell of heath. Though easily frightened, they are not easily banished from a house, and they are especially harmful to young children under the age of seven." Some souls never leave the earth and are never quiet; such souls among the Yakuts are called *yor*. "The souls of those who have died young or suffered death by violence, or who were buried without ceremonies, as well as of the shamans and great people, become *yor*."¹⁸ The ghost of a Chinese alderman, in jealousy of his successor, might give him the disease of which he himself had died.¹⁹ Awe for the dead, who though dead are regarded as still present, is given as the origin of the religious ideas of the Saoras of Madras. The Saoras know a ghost has returned by its cry; there is here a striking resemblance to the Irish belief in the wail of the banshee. The Khonds attribute fevers to the ghostly visits. Ghosts are feared and propitiated by sacrifice, but never worshipped.²⁰ Among the Nayars a *Prêtam* is the spirit of a dead man. "The ghosts of men who died in the ordinary course of events are not really *Prêtams*, because they do not wander about to overpower people and drink their blood. It is generally the ghosts of men who died as a result of foul play, or by accidents such as drowning, or by terrible diseases such as smallpox and cholera that wander about at nights. . . . The *Prêtam* is supposed to hover round its burial place or the place of its accident. Everyone is warned off such a place at night time. The hours during which these *Prêtams* appear are between 9 in the evening and 3 in the morning. It must be noticed here that the *Prêtam* of a 'black-magician,' as distinct from a social magician . . . has more power to do mischief: it has more *orenda*, so to say. The man who practises black magic invariably dies a violent death, and his *Prêtam* hovers round the scene of his former activities. . . . Only epidemics are put down to the wrath of offended gods. Other diseases as well as misfortunes are put down to the influence of *Prêtams*, bribed into action by jealous or covetous relatives."²¹ The Palaungs think that the spirits of many people, especially if their death has been a violent one, do not go along the road of the dead, to eat of the fruit of forgetfulness. Such spirits are never called *kar-bu*; they become *kar-nam*—good or bad spirits inhabiting trees, water, air, earth, or stones, and able to leave their habitation at will. "A *kar-nam*, however, that has once been the *kar-by* of a human being is much feared, especially if it has been the *kar-bu* of a bad man. Such a *kar-nam* is even more dangerous to a human being than is a bad man, because, being invisible, it can attack the unwary in unexpected ways." As illustrating the mode of at-

tack, a native one evening was passing a place when he felt something spring on his back. "He felt it and yet he did not feel it. It threw its arms round his neck, holding him tightly, almost choking him, and yet when he put up his hands to loosen its arms he could get hold of nothing. Its legs seemed to hang loosely, swinging against his body, as he ran, and yet there was nothing that he could take hold of." Anyone dying a violent or a mysterious death is believed to become, for a time, a powerful spirit, remaining near the body in the grave. "If under or in a house any one is killed or suddenly drops down dead, the house is sometimes deserted and the dead person is buried under it. It is feared that the spirit of such a dead person may become an evil and malignant ghost haunting the house." When a woman dies with her child unborn, she is rolled in a mat and buried as quickly as possible. "It would be in a lonely place, far from the graves of others, for it is believed that people who have died a violent death, or on whom great misfortunes have fallen, must have committed some terrible crime in their last existence to come to such a horrible end."²²

The Veddah, being quite callous about his dead, "even when closely related, the survivor would composedly re-open the grave, inspect the body or skeleton, when exposed, and not only carry the remains for several miles, but sleep with them suspended out of the way of jackals or iguanas immediately over him."²³ This, like the Australian case with which we began this set of illustrations, does not necessarily mean that there is no ghost-fear. The Land Dyaks have "very little respect for the bodies of the departed, though they have an intense fear of their ghosts."²⁴ A cutaneous tumor to which the Borneans are subject is called the "ghost's-clutch."²⁵ "Captain Cook was taken by the Hawaiians to be the embodiment of their old king Lono and was received with joy, but was later murdered when they thought they must conclude from his behavior that he intended to take vengeance for injuries he had suffered in his former life."²⁶ Among the Maori "the souls of children still-born were supposed to be of a particularly malevolent character, and, in revenge for loss of life on earth, they remained there and became plagues of blight, pains, accidents, misery, disease, and death."²⁷ Every death that takes place within the family of the slayer, among the Jibaros, in the period following the killing of an enemy, is set down to the secret operation of the revengeful spirit.²⁸

The ancient Israelites reckoned ghosts as among evil influences.²⁹ The Egyptian ghost came forth at night to seek food: garbage, offal, and other offensive things. It was not shadowy, but had a firm body and emitted a pale light. It used all means to compel its surviving relatives to care for it, penetrating their houses and bodies, terrifying them by appearing when they were sleeping or waking at night, striking them with maladies or madness, or sucking their blood. The way to satisfy the ghost was to bring to the tomb sufficient offerings.³⁰ The Greek Erinyes were primarily human ghosts, "but all human ghosts are not Erinyes, only those ghosts that are angry, and that for a special reason, usually because they have been murdered." They are the outraged

souls of dead men crying for vengeance.³¹ "Souls of those that had not received burial and funeral-rites or who were torn out of life untimely found no rest after death; such souls swept about in the wind with Hecate and her demonic hounds."³² The malevolent ghost of the woman who has died in childbirth, will be noted, as a special case, in another connection.³³

§220. Life in the Other World.

THE funeral rites of Oceania, though numerous and diversified, can be carried back to a few main principles which allow of inference as to the nature of the other world. First, it is a widespread feature of these rites that the bodies of the dead are placed in canoes or in representations of canoes. The canoe forms a feature of the ritual, both when the body is interred and when it is preserved on platforms or in the house. There can be no doubt, comments Rivers,¹ that the function of the canoe is to convey the dead to their future home, either on the earth or to some place from which there is access to the underworld. Another funeral-practice of Oceania may also be connected with the belief in a spirit-world accessible by crossing the sea, namely, the custom of throwing the dead into the sea. Rivers believes that both practices are to be explained on the basis of migration—that immigrants into Oceania believe in a return after death to the country from which they had come.

According to native beliefs in the Trobriand Islands the spirit leaves the body immediately after death has occurred and goes to Tuma, the land of the dead. "The route taken and the mode of transit are essentially the same as those which a living person would take in order to go from his village to Tuma. Tuma is an island; one must therefore sail in a canoe." The spirit leads a positive, well-defined existence in Tuma; it returns from time to time to the village; it has been visited and seen in Tuma by men awake and men asleep, and by those who were almost dead yet returned to life again; it plays a notable part in native magic and receives offerings; and finally, it asserts its reality in the most radical manner by returning to the place of life, by reincarnation, and thus leads a continuous existence. The after-life is very real.² To get to the spirit-land souls must cross from the west end of Florida Island in a canoe. As they land, they realize for the first time that they are dead.³ The natives of New Hebrides supposed that the spirit at death left the body, went to the west end of the island, plunged into the sea, and swam away to a place of spirits, where, it was said, there were two divisions, one for the good and another for the bad. Plenty of good food in the next life constituted the reward of the good, and the contrary the punishment for the thief, the liar, or the murderer. In accordance with their belief the natives cast their dead into the sea.⁴ The Efatese think heaven is very near the earth; one may climb up to it. The aged are here buried alive, with accompanying sacrifice of pigs which are supposed to go with the deceased to the world of spirits; "the greater the chief the more numerous the pigs, and the more numerous the pigs the better the reception in their hades of heathenism."⁵

5 Macdonald, in AAAS, 1898, 767; Turner, *Samoa*, 335-336.

The nature of the way to the spirit-world, as conceived by some natives of New Guinea, is as follows. The spirits of the dead descend into a huge cave on a rocky cape, at the bottom of which is the passage from the earth to the world beyond. At the bottom of the cave there lies a great serpent, its slimy body stretching away beneath the sea and its head resting on the shore. As the way is long and perilous, ample preparations must be made by the friends of the deceased. If their grief is great, and the food they bring to the feast is plentiful, the spirit will walk with ease along the slimy back of the great serpent; if they neglect their friend, he will be weak and his feet will slip. Should he fall into the sea he will be transformed into a fish. If the passage is successfully made, the spirit will be received by Sauga, who will light a fire under a frame of split cane and place him upon it. As the heat of the fire rises, the body will gradually come to life again, and his friends who are there will identify him and make a great feast in honor of his safe arrival.⁶ In the Laughlan Islands, too, the spirit has to cross a big snake on the way to the realm of the dead, with the constant danger of falling into the sea.⁷

Life in the other world, among all the Melanesians, is a replica of life in this, with some idealization. In the Hades of the Southern Massim there is plenty to eat and no sickness or evil assails the spirits. The wealthy here are wealthy there. "Each community has its own place. The spirits can go out fighting as they did here, and it seemed that anyone then killed was destroyed for ever, indeed all could die again and that would be the end. They would know their own friends and, on the whole, life in the other world is a repetition of life here."⁸ The Bina conception of heaven is that it is a land similar to this earth, though much fairer, where the spirits lead the same sort of life and eat the same food as they do in the land of the living.⁹ The spirit-world is a reality to the natives of the Papuan Gulf; "each tribe has its own locality for it—it may be away in the west, toward the region of the setting sun, or it may be far back in the mountains of the Gulf Hinterland—but however uncertain they may be as to the precise locality of the abode of the spirits of their deceased relatives, of this one thing they are confident, that the latter still exist and can visit the living who are still in the flesh."¹⁰

Some distinction may be made in the land of spirits between the "good" and the "bad." There may be a record of what the soul has done and what it has left undone. When it appears in the next world the spirit may make its character known: "I am pure! I am pure!"¹¹ According to certain Papuans, "the reception of the spirit depends upon the condition of the life spent. The spirits of the rich, the brave, the well-formed, the healthy and wholesome, are welcomed with dancing, and led over the bridge across the chasm into everlasting life with the blest. The spirits of the poor, the emaciated through long sickness, of those who have suffered from scrofulous sores, are led by the dancers on to the bridge, which then turns into a snake, and by its wriggling precipitates the so-called bad spirits into a deep gulch, where they remain for ever and ever. The question of character or conduct does not determine the abode of the spirits, only that sorcerers who have so much power over life and death on the earth are requested to live in a special community of their own."¹² The Solomon

Islanders nearly all believe that when a man or woman dies he goes to live with a good spirit in a far-off but pleasant land, where his companions will be as good as he is, or nearly so. The bad man, so judged by his companions, goes to a place of fire, the abode of the Evil One, where he has anything but a happy time. "During his existence there he does his best to make things unpleasant for the friends he has left behind him, by becoming one of the many evil spirits who are supposed to do harm to the living."¹³ At Eddystone, the abode of the ghosts is a big cave, where they sleep in the daytime and go about at night; for day is like night to the ghosts. Sometimes the spirit of a father or mother turns into a butterfly and comes to settle upon the head of his child. "Oh! a spirit is on your head," the people say.¹⁴ The spirits do not dwell in the next world for ever; eternity is a concept beyond the grasp of natives who often have no numeral beyond three.¹⁵

Among the Ewe-speaking peoples of West Africa, every man is believed to occupy the same position and to have the same powers, avocations, and tastes in Dead-land that he had in this world. So real is the other world that ambassadors were sent by the king of Dahomi to spirits there; one case is mentioned where a native was taken out to sea in a canoe and then thrown overboard, so as "to join the two porters of the sea-gate, to open it for his [the king's] father to enter in and wash himself."¹⁶ Belief in the existence of another world also explains the readiness with which the negroes will commit suicide.¹⁷ Among the Nigerian head-hunters, if it be time for the sick person to die, the soul crosses the bridge to the spirit-land, and then can never return to that particular body, which must die. "The *mobwoi* lead lives of ordinary men. Spirits of enemies will continue fighting until stopped by the Supreme God. The ghosts ride, eat, and hunt as in life, and are always ready for beer."¹⁸ In East Africa the spirits are supposed to live as they did on earth, with cattle as their riches; some are rich, others poor.¹⁹ The natives of British Central Africa do not conceive of an underworld, though a "bad man" is thought not to go to quite the same place as others; there is no idea of punishment or hell-fire, however. "The spirits in the spirit world are supposed to sit about doing nothing; they talk and see everything going on on the earth below. . . . They do not appear to speculate about going to the spirit world, and as they do not think of any retribution to be dealt out it makes no difference to their conduct on this earth."²⁰ More definite are the notions of the Bagobo, who hold that each individual has two souls, the one of the left side which is evil and which becomes a *buso* or demon, and the one of the right side which goes to the one Great Country beneath the earth where it lives forever. "At the entrance to the Great Country is the Black River in which the spirit bathes his joints and thus becomes naturalized to the world of spirits. In his eternal home he continues his life as on earth during the hours of darkness, but at the rising of the sun all is changed. Each spirit plucks a broad leaf, twists it into a vessel and seats himself on it, and there sits, waiting, until the hot rays of the sun cause him to dissolve, leaving the vessel full of water. When night returns, he resumes his personality and takes up his work or dance as if no break had occurred."²¹

The Gilyak, like the Ainu, believe that the next world is a counterpart of the physical world; there the dead live in the same way as they did on earth—fishing, hunting, marrying, and having children—except that the poor man becomes rich there and the rich man poor. They have sickness and death, after which the soul goes to the third world. There is no real belief in immortality among the tribes of Siberia. Among the Samoyed, the dead, with whom many of his belongings are buried, is supposed still to exist for a short while, and during that time food is brought to the grave and the sacrifice of reindeer is repeated several times, but when the body has once turned to dust there is nothing beyond. Only the shaman attains to the privilege of a future life. The shadow has a difficult journey to make, climbing high mountains and crossing streams of fire. "To assist it in this, one must burn the portions of hair and nails which were cut and preserved during his lifetime, together with a few feathers of spring birds. The implements placed in the grave, and the food which is taken thither from time to time, are also destined to assist it on this terrible journey." A man, according to the belief of the Finnic tribes of Siberia, is composed of three parts: body, shadow, and soul. At death the soul passes to an infant of the same clan, while the shadow goes to a cold underworld, situated in the icy seas beyond the mouth of the Obi. "Here it lives for as long as the term of the dead man's former life on earth, and follows the same pursuits—reindeer-breeding, fishing, etc. Then the shadow begins to grow smaller and smaller, until it is no larger than a blackbeetle, (according to some it actually does turn into a blackbeetle), and finally disappears altogether."²²

One account of the Sema Nagas says vaguely that the good souls go to the east toward the rising of the sun, while the bad ones go westward to its setting; another that souls go into butterflies or other insects, a common Naga belief; but the commonest and best-known theory, the holding of which, however, does not apparently preclude belief in one or both of the others, is that the souls go to the Hills of the Dead, to pass thence into another world. "With them they take those of their worldly possessions (or the 'souls' of them) that have been buried with them or placed on their graves, and all the mithans [buffalo] they have sacrificed or killed during life accompany them." The writer²³ has known a chief nearing his end to ask for a new Government red cloth, which is issued as a badge of office, in order that when he reached the world beyond the grave he might be recognized at once as a servant of the Government and treated with becoming respect. Once in the future home, the Sema dead live just as they did in this world. "He that is poor shall be poor still, and he that has been rich shall remain so. But though this belief holds but cold comfort for those who are poor and in misery, the Sema has it at least to his credit that he has not, with the detestable self-sufficiency of the purblind West, fatuously arrogated to man alone of animals the possession of a soul and the power of reasoning. It probably remains for the Christian missionaries to teach him that." The Angamis give a definite description of the abode of departed souls. "When a person dies, they believe that the spirit goes to a heaven under the ground where everything is exactly the same as in this life; parents are re-united with their children, and husband and wife live over again the happy days spent in the upper air. The land is rich in trees, flowers and animals

²³ Hutton, *Sema Nagas*, 211, 212-213.

of all sorts; the sun shines by day and the moon by night. When they die a second time, the souls pass to another heaven below the first, unlit by sun, moon or stars, where the souls live and die again; but when they die for a third time the souls come back to this earth as butterflies or small house flies, and in this shape perish for ever. When these small flies light on their wine cups, they will not kill them for fear of destroying someone of their ancestors."²⁴

When the Todas of southern India die, their souls come to a ravine and river across which is a thread-bridge. Here those who have been bad during life fall into the river and are bitten by leeches, while the good cross the thread successfully and go straight to Amnodr. Those who fall into the river are helped out by the people who live on the farther bank, who may keep the offending Todas in their country for some time; the greater their offenses, the longer they are kept, but all, however bad, reach Amnodr sooner or later. Those who fall into the river are the selfish, jealous, and grudging people, and those who have committed any offenses against the dairy, which is a sacred industry among the Todas. The danger of falling into the river does not seem to have much influence on the people. "It has been spoken of as the Toda Hell, but it is rather a mild variety of Purgatory, and only involves some discomfort and delay on the journey to the next world." The buffaloes killed at the funeral are supposed to go to Amnodr with the dead person. "Sacred buffaloes are only killed at the funerals of men, for they would be useless to women, who, in the next world as in this, have nothing to do with dairies at which the sacred buffaloes must be tended."²⁵

Among the more advanced people in India, as would be expected, there is a more definite notion of rewards and punishments for good and evil in the next world. There is a belief that when a bad man dies his spirit takes a downward course through the intestines and emerges in the same manner as the excreta; whereas the spirit of a good man finds its way through the tenth aperture of the body, which is a suture at the top of the skull, called "Brahma's crevice." No sooner has death occurred and cremation of the terrestrial body taken place, than Yama's two messengers, who are waiting near at hand, make themselves visible to the released spirit. Their aspect is terrific and, as if their appearance were not sufficiently alarming, they proceed to terrify their victim by terrible visions of the torments in store for him. The bound spirit is finally led along the road to Yama's abode. Standing before his judgment-seat it is confronted by the Registrar or Recorder, which officer stands by Yama's side with an open book before him. It is his business to note down all the good and evil deeds of every human being committed during his life, with the resulting merit and demerit, and to produce a debit and credit account made up and balanced on the day of death. According to the balance on the side of merit or demerit is judgment pronounced. The ceremonies performed on behalf of the dead by his relations have power, if properly carried out, to turn the scale and perhaps place a considerable balance to his credit. Finally, on the thirteenth day after death the spirit is conducted either to heaven or to one of the hells.²⁶

The natives of Borneo believe implicitly in another world, some tribes having even a sort of courier-system to it. They buy a slave, tie him up, and one after

²⁴ Furness, in JAI, XXXII, 463.

²⁶ Monier-Williams, *Brāhmanism*, 291, 292-294.

another sticks a spear an inch or so into his body, all of them pronouncing messages to deceased friends as they do so. It was even harder to get them to leave off this custom than to abandon head-hunting.²⁷ While life is thought to go on as before, with the same class-distinctions and the like, there is some notion, though confused, that after death the spirits of good men travel toward the west to be absorbed into the effulgence of the setting sun, while the souls of the bad are devoured by specters which approach the graves for that purpose on the seventh day after interment. On that day fires are kindled to drive them away.²⁸ The natives of southern Borneo believe that the soul, in its journey to the next world, comes at length to the Rayah River—the river Styx of all the Bornean tribes—over which is placed a log that has this peculiarity: it is not quite long enough to span the stream from bank to bank. As the soul and its conductor reach the bank, the log glides up to them, when the soul of the deserving one steps on it and is ferried across in safety to the opposite shore; if, however, the soul of a wicked person approaches, the discerning log suddenly slips away as he steps upon it, thus precipitating him into the waters where dwell the fiends, typified by a huge fish. When it devours him, he dies a second and final death from which there is no resurrection. Hiller,²⁹ who reports this, once asked a man what constituted a crime so heinous as to cause a soul to be cast to the devouring fish. The reply was prompt: "Any man who refused to get married"; nor could the author get him to cite any other fault so wicked. In Sarawak paddling motions indicate travel to the next world.³⁰ Among the tribes of the Malay Peninsula the souls of ordinary people are variously represented as being compelled to cross a boiling lake by means of a tree-bridge, from which the wicked slip off into the lake below them, and as being sent to a different and a far less inviting paradise. In some cases, the soul after death is repeatedly washed in a cauldron of boiling water by "Granny Longbreasts," in order to purify it from its stains. Thereafter it is made to walk along the flat side of a monstrous chopper with which she bridges the cauldron, the bad souls falling in and the good escaping to the land of paradise. If the soul needs more purification, it is thrown in twice or three times; if still black, it is cast under the earth as a demon, of the kind most appropriate to the sin it had committed. The idea of a better spirit-world occurs several times, a future world in which all live in harmony together, a great island full of trees and pleasant fruits. "There, too, the souls marry and have children, as in the present world, but pain, disease, and death are unknown." Men who have died a bloody death do not go there but to a desolate and barren place.³¹ According to the ideas of some Filipinos, when the new arrival in the next world is asked concerning his life, a louse on his body is the witness and answers for him. When Worcester³² asked a native what would happen should the man not chance to possess any of these interesting arthropoda, he was informed that such an occurrence was unprecedented! "Every one was well off in this happy underground abode, but those who had been wealthy on earth were less comfortable than those who had been poor." Sickness and death come again, however; persons die seven times, each time with

an improvement of condition if the preliminary examination has been successfully passed. The author asserts that the Moros believe the soul lives forever.

Some Polynesians believe that the soul, having fallen into a dark realm under ground, is eaten by the gods, parts of it being cut off with shells. This operation is performed by the relatives of the deceased who died earlier.³³ The Hawaiians believed in a subterranean world of the dead divided into two regions, to the upper part of which went the good, while those who had not been sufficiently religious had to go to the lower, where they had lizards and butterflies for food. Traditional points from which the soul took its leap into the underworld are to be found at various locations in the islands.³⁴ In Samoan mythology, the eighth heaven, like the third heaven of the Hebrews, was the residence of the gods; in ancient times there was much intercourse between the inhabitants of heaven and earth—probably before the occasion when, according to their tradition, the skies were raised from low down near to the face of the earth into their present position. In those days the heavens were thought so near that they could be reached by climbing into a tree.³⁵ In Bowditch Island, at death one would say to his friends, "I'm going to the moon—think of me as being there." Another would say, "I'm going to be a star," and mention the particular part of the heavens where they were to look for him. Another might say, "I shan't go away, I shall remain in the grave, and be here with you." Thus they seemed to think they had only to choose where their disembodied spirits were to go after death.³⁶

When a Maori died, his spirit was supposed to leave the body and fare forth to the Spirits' Leaping Place, situated at the northwest extremity of the North Island of New Zealand, where it plunged into the ocean and descended to the underworld. "This abode of the dead much resembled that of the ancient Hebrews. It was a realm wherein the spirits of the dead seemed to live much the same sort of life as they did in the upper world." There were also future existences for the spirits of dogs, rats, and other animals, and one for fish. In the old Maori belief, there was no suffering or unhappiness in the spirit-world, and absolutely no punishment for the soul after death, no matter what the character or acts of a person in this world may have been;³⁷ such ideas came through missionary influence. At the southern gate of the spirit-world, thought the natives of the Gilbert Islands, sat the guardian Nakaa, awaiting the souls that came from the land of the living. "And as he sat he was for ever making nets, with his back turned to the path that led to the entrance of his dwelling-place, but well he knew when a soul crept up behind him. So, when it was near by his right hand, he reached forth and enmeshed it in the strand of his netting-needle; he laid it across his knees; he searched its heart for evil. And if he found incest therein, or thievishness, or cowardice, he straightway cast the soul out of his sight into a place of everlasting nightmare . . . or he impaled it upon the terrible stakes . . . or he flung it into the midst of a company who writhed together in eternal entanglement. . . . If the paradise of an island folk is up in the heavens," comments the author,³⁸ "it generally means that the people have been for so long resident on their morsel of land that they have forgotten the direction from which their fore-

fathers came; they can no longer direct their dead back along the old migration-track to the ancient fatherland."

The Eskimo think that the dead go to a lovely land under the earth; they have no hell. But the journey is not easy: the dead must slide down a high, sharp rock on their backs. It takes five or more days to slide down this rock, which becomes covered with blood. This they call the second death, after which nothing is left of them; they fear it very much and surviving relatives and friends must observe certain precautions to protect them from it. The Indians also think of a mountain-ridge, sharp as the sharpest knife, along which souls must pass to their dwelling-place.³⁹ Boas⁴⁰ says that a young Eskimo girl once sent for him a few hours before her death and asked for some tobacco and bread to give her mother, who had died a few weeks before. The Tlinkits of Alaska call the place where the souls of the departed dwell the ghost's or the spirit's home, the word for ghost being the same as that for spirit. When the fire crackles, spirits are hungry and calling for food. The living put food in the fire, food and clothing in the tomb of the dead, and canoes beside the dead-houses of their deceased shamans.⁴¹ The Salish Indians say that the seasons and also the times of the day in the land of the dead are exactly the opposite of what they are in this world. "When it is midwinter here, it is midsummer there, and when it is night here, it is daytime there. Therefore the most advantageous time to visit the land of the dead is during a night in midwinter, because then it will be a fine, bright summer day in the other world. In fact this is the only time of the year when the trail to the ghost-land is at all passable."⁴² In the belief of the Northwest Coast Indians the country of souls contains two divisions, one inhabited by recently arrived souls and the other by souls which have been there for a longer time. "On their journey to this land the souls pass a rest-house, then a lake and a berry-ground. Their way is barred by a spring-pole, and they must cross a rotten log, the final barrier being a wide river."⁴³

The beliefs of the Quileute Indians of this section have been well and fully described. All souls, whether they belong to male or female beings, to good or bad people, go to the same place and traverse the same trail, excepting the souls of infants. These have a country of their own, which will be described later on. "The dwelling place of the souls is called the Country of the Ghosts and is situated way under ground. The place and the trail leading to it have often been described by shamans who, accompanied by their guardian-spirits, used to go down there in order to bring back the souls of some of their patients. . . . The underworld or Country of the Souls is situated very far from the surface of the earth. A shaman traveling there with the aid of his guardian-spirit requires two days and two nights for that trip and, be it remembered, these guardians travel with lightning rapidity. The road is good and broad, and the underworld itself is a large valley with neither hills nor mountains. Through the center of the underworld runs a river, about a quarter of a mile wide, and the souls dwell on both banks of this river, occupying houses exactly like those of the living Quileute. The river divides the underworld into two equal parts. On one side live those souls who have died long ago, while on the nearer bank dwell the souls of recently departed Indians.

42 Haeberlin, in AA, XX, 252.

43 Frachtenberg, in AA, XIX, 319.

The river is crossed by means of a canoe, and for that reason the Quileute Indians bury their dead in canoes. The soul of a poor Indian whose relatives cannot afford a canoe-burial, crosses the river by walking on the fishtrap owned in common by all the inhabitants of the underworld." At a place situated about a third of the way from the upper world there stands a house called "mat-house" in which the traveling souls stay over night, resting and acquiring new strength for a continuation of their journey. In the morning they resume their travel and soon reach a lake called "sticky water" which is so situated that each soul must wade through it in order to continue the trip. "The water of this lake, when partaken of by a soul, causes the actual death of its owner. Hence, a shaman going in quest of a lost soul, will always refrain from tasting this water. Beyond this lake there are berry-grounds where the souls pick salmon-berries and strawberries. These berries, too, may be eaten by the souls only. A shaman, who even touches them, drops dead. Farther down the road there is a pole stuck into the ground and continually springing over the trail. The souls have no trouble in passing this pole. But the shaman, in order to pass by it safely, must have a special magic . . . which causes the pole to stop its swinging motion while the shaman goes by." Beyond this pole there is another obstruction in the form of a rotten log lying clear across the road in such a way that each person must step over it; "since this log keeps on shrinking and expanding just like a rubber, only a soul or a shaman having the 'ghost magic' can go over it. From here on the trail becomes fine and unobstructed, ending at the very river."

The souls of recently departed people cannot cross at once to the other side; if they do so, they are driven back. "They must stay on the nearer side until they have lost all scent of 'recent death.' The 'older' souls have a sentinel on each side of the river . . . whose duty it is to see to it that no 'new' soul comes across until the proper time has arrived. As soon as the 'new' soul has completed its apprenticeship and become 'ripe' for dwelling in the 'older community,' it is instructed by one of these sentinels how to act and what to do in the real Country of the Souls. New arrivals are usually met and welcomed by the souls of those relatives and friends who had preceded them into the underworld." The Country of the Souls differs in no respect from the upper world. "It is abundantly supplied with all necessities of life. Each soul pursues the same occupation as in the world above. Sickness prevails among the souls to the same degree as among the living Indians, and the soul-shamans are kept constantly busy. Good and bad weather, day and night, changes of the season prevail also in the underworld. Women bear children in the usual way, and wars are not infrequently waged among the souls. The souls have an ocean of their own, thereby giving them the opportunity to follow the whale-hunting profession. All souls stay in the underworld forever. Animals, birds, fish, etc., dwell in special underworlds of their own. These are visited by the dead hunters and fishermen who thus obtain their necessary supplies of fresh game and fish. No one knows the exact locations of these places, nor has any living person been able to find out how to reach them."

Attention has been called to the fact that, according to Quileute belief, infants and children live in a separate underworld. This is situated south of the country of grown-up souls, and has a trail of its own, which is covered with nice, green grass and is much shorter than the other road. "It is not dotted with obstructions and leads right into the habitations of the souls. . . . Swings made

of poles are found everywhere and are used by the children constantly. The houses are located right behind the playgrounds. A beautiful lake is situated in the middle of this underworld, and the children bathe in it frequently. It is not known whether and what the souls of infants eat. All children are under the perpetual care of some old women . . . who stay with them all the time. No one has ever been able to find out how many of these keepers there are and how they came to live in this underworld. The children are never visited by the other souls, as there are no means of communication between the two underworlds."⁴⁴

The Omaha assert that under certain conditions the realm of the dead is accessible to the living. For instance, "a person in a swoon was thought to have died for the time and to have entered the region of death. It was said of one who had fainted and recovered that 'he died [fainted] and went to his departed kindred, but no one would speak to him, so he was obliged to return to life' [recovered consciousness]. It was further explained: 'If his relatives had spoken to him he would never have come back but would have had to stay with the dead.' It seems probable that the stories told by certain persons who had swooned as to what they saw in visions have had much to do in forming the Omaha imagery of the other world. It will be recalled that the sign of the tabu was put on the dead in order that they might be recognized by their relatives. . . . These and like customs confirm the general statement that life and its environment beyond the grave were thought to be conditioned much as on the earth, except that the future state was generally regarded as being happier and freer from sickness and want. It was said that there are seven spirit worlds, each higher than the one next preceding, and that after people have lived for a time in one world they die to that world and pass on to the one next above. . . . There does not seem to have been any conception among the Omaha of supernatural rewards or punishments after death. The same conditions which make for good conduct here were believed to exist in the realm of the dead."⁴⁵ The place of the dead, in Cheyenne belief, is above. Brave and cowardly, good and bad alike, go there; all who have died are equal. "There the dead live as they lived on earth—they chase buffalo, hunt other game, and go to war."⁴⁶ In Hopi mythology the human race was not created but generated from the earth, from which man emerged through an opening now typified by the Grand Canyon of the Colorado; the dead are supposed to return to the underworld.⁴⁷ The Chippewa imagined that the shade, after the death of the body, followed a wide beaten path, leading toward the west, finally arriving in a country abounding in everything the Indian desires.⁴⁸ Life after death was very real to the Dakota Indians, among whom a dead man may be initiated into the esoteric medicine-club by ceremonies over a lock of hair.⁴⁹ Among the Sia of New Mexico, "the spirits of all animals go to the lower world; domestic animals serving the masters there as they did here."⁵⁰ The Zuñi conceive that the dead dwell in a region below the Sacred Lake, which is sixty-five miles to the southwest of the town of Zuñi; there life is just the same as at Zuñi, families and households being reunited.⁵¹

The journey to the next world is often beset with obstacles. A famous Kicka-

poo prophet once displayed a chart of the path, leading through fire and water, which the virtuous must pursue to reach the "happy hunting grounds," and furnished his followers with prayer-sticks graven with religious symbols.⁵² The Menomini believe in a four-day journey to the hereafter; before reaching the goal the soul is tested and must cross a log-bridge guarded by a dog.⁵³ "Like the Iroquois and Huron sages, the Algonquian philosophers taught that the disembodied souls of the dead, on their journey to the great meadow in which is situated the village of their deceased ancestors, must cross a swift stream precariously bridged by a tree trunk, which was in continual motion. Over this the manes of the justified pass in safety, while the shades of the vicious, overcome by the magic power of adverse fate, fall at this ordeal, and, falling into the abyss below, are lost."⁵⁴ According to Winnebago beliefs, the soul may be helped to overcome the hazards of the journey; warriors are invited to the wake because it is believed that the souls of the enemies they have killed become their slaves in the spirit-land and they can order them to take charge of the soul of the recently departed individual and clear his path of the obstacles that beset him on his journey from the land of the living to that of the spirits. "Especially difficult to the passage of the soul is an enormous girdle of fire which it must be carried over to reach the spirit home of its clan. The warrior relates his war experiences, but in so doing he is strongly admonished to be very careful and not tell them in a boastful way or to exaggerate in any detail, for if he does so the soul of the departed would fall into the abyss of fire. In this connection it may perhaps be suggestive to note, that it is not any transgression of the deceased that prevents him from reaching his goal, but a transgression of the warrior relating his war experience."⁵⁵ A belief similar to that of the Menomini, one found also among the Seneca of New York, is the Seminole notion of the other world: "The Seminole believe that the souls of the worthy dead go to an abode where existence is ideal, where social dances, feasts, and ball games are held uninterruptedly; but those whose earthly existence has not been above reproach are doomed to destruction. The souls must pass over a long trail from the world to the sky country. This journey requires four days, and a number of tests, consisting of tempting food placed at intervals beside the path, are encountered. If the ghost partakes of any of this food, some unknown misfortune will overwhelm it. At length the wanderer arrives at a river, over which a slippery log gives access to the village of the blessed. The bridge is guarded by a dog, and if the wayfarer has led an evil life, the animal shakes the log and hurls the unfortunate being into the stream, where it is devoured by an alligator or a great fish." In accordance with this belief, a fire is kept beside the cairn for four nights after the burial, in order to provide light and warmth for the spirit of the deceased on its sky journey.⁵⁶

When calamity threatened, the Mayas of Yucatan flung virgins down an abyss, after explaining to them what they were to ask of the gods before whom they were to appear.⁵⁷ The Guiana Indian's vengeance is carried beyond the grave: when the death of any member of the Akawai tribe is supposed to have been brought about by unfair means, the knife of the deceased is buried with him, that he may have the means of avenging himself in the world of spirits;

the Warraus, in similar circumstances, place a bow and arrows by the side of the dead man, that he may by means of those weapons keep off malignant spirits in his passage to the other world; while at the burial of a male Makusi, not only the dead man's knife but several thongs are buried with him, the latter enabling him to tie to a tree the spirit who had caused his death. According to the views of the Caribs, the spirits of the good and bad rise after death toward the skies; "the former travel high, very high, above the clouds where they find pretty women; they dance every night; they drink cassiri, and do not work in the clearings (provision-fields). The wicked remain below the clouds where they are always roaming without any hope of getting higher. If the body is burned immediately after death, this is done in order that the spirit may ascend with the smoke." There are interesting records left us concerning the Island Caribs: "(a) Some hold that the most valiant of their nation are carried after death to the Fortunate Isles, where they have everything they can wish for, and that the Arawaks are their slaves; that they swim without being tired, in the wide and large rivers; and live delightfully and pass the time happily in dances, games, and feasts, in a country which produces all kinds of good fruits without being cultivated. (b) On the contrary, those who have been cowardly and timid in going to war against their enemies, have, after death, to serve the Arawaks, who inhabit desert and sterile countries which are beyond the mountains. (c) But others, the most brutal, do not trouble about what takes place after death: they neither dream nor talk about it."⁵⁸ The Araucanians believed in a future state but not in hell. "After death they went in an invisible, but corporeal, form to the other world, where the evil spirits had no entry, where there was always abundance, and where they passed their time feasting and drinking and dancing, waited on by their wives, who had either preceded them or would follow after. The same castes were preserved there as on earth, but the poor people and the public women went to another land where it was always cold. . . . To arrive at their future resting place it was necessary to cross the sea. For this reason the dead are buried facing the west. Before arriving at this happy land they had a long journey to make. So that they should want nothing on this journey, a good supply of provisions, blankets, skins, etc., were buried with the corpse, and a horse was either buried also or slaughtered over the grave. The island of Mocha was formerly believed to be the starting place for this long trip. Spirits of the dead had to follow a narrow path, guarded by a witch, who collected tribute from all passers. Even now the Araucanos bury some few coins or other objects with the dead to discharge this obligation. The coast tribes believed that certain witches transformed themselves into whales to ferry them from the mainland to the island, while the inland tribes supposed that they changed into canoes."⁵⁹

In the earliest period of Egyptian history the picture which was drawn of the future life was gloomy. The rich, whose bodies were well cared for and secure in durable graves, could hope for continued existence, but the poor had nothing much to expect. When, later, a more blissful state was conceived, it belonged at first solely to the king and was only gradually extended to include wider and wider circles till at length all looked forward to ultimate felicity. This change was accompanied by new conceptions of moral values and with the introduction of the future judgment to which all were subject; only such as

⁵⁸ Roth, in BAE, XXX, 156, 157, 160
(quoted), 161 (quoted).

⁵⁹ Latham, in JAI, XXXIX, 348.

could successfully withstand this judgment might hope. The goddess of truth led the soul to the throne of Osiris, where his heart was weighed on a scale, being balanced against the image of the goddess of truth. If found too light, the soul was annihilated. The good man addressed prayers to his heart not to speak out against him. The Book of the Dead prepared the souls with rituals and other magic means to assure their journey to the eternal dwelling-place. The Egyptians did not hold to what we mean by the phrase "the immortality of the soul"; rather was it a belief in revivification, a doctrine probably somewhat more developed than among the Babylonians and other Semites.⁶⁰ The earliest Hebrews held that at a man's death a kind of image or outline of his whole personality detached itself from the corpse and descended to Sheol. Their abode of the dead was thought of as a subterranean space, for one "goes down" to it, while it had two other constant features: a prevailing thick darkness and an impossibility of return. The concept of Sheol, which later became the hell-fire of the Christians, was probably Arabian-Syrian in origin. At a later time a favorable place was reserved in Sheol for the good, a kind of heavenly oasis, which developed into the Christian heaven. The idea of immortality is quite weak in the Old Testament, while in the pre-exilic prophecy there is not a trace of any expectation of a continued life after death or of resurrection.⁶¹ The pre-Mohammedan Arabs knew no immortality; the souls merely lived on, in the memory of the living, in much the same way as on earth. As Abel's blood cried out to Jahweh, so did the murdered Arab call for revenge.⁶² Belief in the life to come is one of the chief dogmas of the Zend-Avesta, and closely connected with it was a belief in heaven and hell.⁶³ In the Vedas the doctrine of the immortality of the soul is not very prominent; the great desire of men in that age was worldly prosperity, the "powers of the world to come" did not exert any great influence upon the community.⁶⁴ Belief in another life prevailed in ancient Rome and tablets have been found in graves there and elsewhere, which contain instruction to the dead for their conduct in the world below, exhortations to the soul, formularies to be repeated, confessions of faith and of ritual performed, and like matters.⁶⁵ Celebration of the birthdays of the dead was common in antiquity; "we see clearly that between life and death lies no impossible chasm; it is as if life were not interrupted by death."⁶⁶ The ancient Gauls were said to have been accustomed to lend money on the condition of its being repaid to the lender in the next life.⁶⁷ Among gypsies today, beads, combs, and jewels are placed in the coffin; in one instance, at the burial of a gypsy queen, two hats were also deposited in the casket, to enable the corpse to have comfort while going across the Styx.⁶⁸

In Scandinavian mythology the shades take rank in Valhalla according to the wealth they bring with them. The Swedes thought that Odin at his death went back to the place, by tradition northeast of the Black Sea, whence their ancestors had come.⁶⁹ In the *Sampo*, a collection of Finnish legends, there is

a river to be crossed by boat in order to reach the realm of the departed.⁷⁰ Among the Mordvins, "on the eve of the day for commemorating the deceased, forty or forty-nine days after death, the nearest relative who most resembles the defunct is asked to personify him." He dresses in the clothes in which the dead man died and sits on his death-bed. Presents of food are brought him. "At night a very noisy feast is held, during which the personator tells of the life beyond the grave, and about the crops there. To the visitors that inquire after their dead relatives he gives the most circumstantial news. 'Your relative keeps good horses, and drives about the forest in a carriage;' 'Yours has ruined himself;' 'Yours keeps bees;' 'Yours is given to drink;' 'Yours has married a beautiful wife.' About midnight all gather round to listen to the wishes of the dead man. His personifier then advises them to live peacefully, to look after their cattle, not to steal, and hopes they will have abundance of beer and brandy." The impersonator is then carried on a bed to the grave and set upon it. He is begged to eat for the last time and to return at the harvest, when they will reap his share for him. If ancestors are neglected and left to starve, they send warnings in dreams and the survivors are quick to take the hint. They make a feast, the greater part of which they eat themselves, and leave the remains of it near the cemetery.⁷¹

§222. Avoidance.

WHEN a native of Central Australia is dying, all the members of the tribe sit in a circle and sing a death-dirge, the body of the dying person being kept warm by being covered, all except the head, with hot sand taken from underneath a fire. After death, five small circular holes about two feet in depth are excavated by means of a boomerang round the hut of the deceased, and the hut is then burnt.¹ The Tasmanians, when feeling very ill and near death, objected to the presence of a white man; "they also disliked under these circumstances to be on a bedstead and always endeavoured to get down on the floor and lie in front of the fire."² The Melanesians very generally hold that it is necessary for all people not of the dead man's clan to disassociate themselves from him and all that belonged to him in every possible way. The house in which he died is usually deserted or destroyed, not so much as a sign of sorrow as through fear of the ghost of the deceased and the conviction that if this were not done evil spirits would come back again and other members of the family would be affected. Some groups carry out complete avoidance, as among the Roro-speaking tribes where, "on the day after a man's death many of his effects, but not his jewellery, are broken or damaged and hung beneath the eaves of his house, which usually is not again inhabited and is allowed to decay. It was said that when the vegetables planted by the dead man became ripe they were also hung to the eaves of the house and allowed to rot."³ In the New Hebrides the natives sometimes did not wait until the sick person was dead, so anxious were they for his demise: "If a person in sickness showed signs of delirium, his grave was dug, and he was buried forthwith, to prevent the disease spreading to other members of the family. I was told of a young man in the prime of life who was thus buried. He burst up the grave and escaped.

² Agnew, in AAAS, 1887, 480.

³ Seligmann, *Melanesians*, 13, 274 (quoted), 525, 631, 632.

He was caught, and forced into the grave again. A second time he struggled to the surface; and then they led him to the bush, lashed him fast to a tree, and left him there to die."⁴ In D'Entrecasteaux the mourners sometimes pull down the dead man's house, though more often they leave it to rot with whatever food may be inside it; in one or two instances, however, a brother occupied it afterwards. "If the deceased be other than the father of the family, the house is almost certain to be pulled down, though it is rebuilt later on the same posts; a father who acted otherwise might be thought lacking in affection for his child."⁵ In one of the Solomon Islands, a taboo lasting for six months is placed upon all coconuts that belonged to the deceased, no one being allowed to go near them, touch them, or trade with them.⁶

Throughout Melanesia people are afraid of meeting a ghost. When death occurs in a Trobriand village, "there is an enormous increase of superstitious fear," and "the immediate neighbourhood of the grave is absolutely deserted when night approaches."⁷ In the Loyalty Islands, through fear of meeting a ghost when walking, the center of the company is preferred as being safer than the outside.⁸ On the night of a death, among the Southern Massim, no one in the neighborhood will leave his house, and "in a modified form the custom is kept up till the next new moon, inasmuch as people will not walk about casually at night, nor use the path near where a death has taken place." The killer or captor of the victim who is eaten at the cannibal feasts of these people secludes himself for a month and observes various taboos, in order to avoid the evil influence of the dead man, of whose ghost he is in mortal terror.⁹ Among the natives of the Papuan Gulf, the spirits of individuals who have met a violent death from the hands of a murderer, or from a crocodile, are supposed to roam about constantly and are frequently seen near their former abode, which consequently is avoided. The latter type, which often resides in the crocodile that ate the body, is especially malicious, but the natives have devised a method of avoiding it. "When a spirit becomes a nuisance, the people whom he troubles wait for his return, and then take a canoe and paddle away up the river or creek, the spirit following. They leave the canoe and get into the bush, where he gets bewildered, as his crocodile-affinity cannot find its way about the bush; the crocodile-spirit being now lost in the bush, the party who came out to lay it ultimately return to the village and are not troubled by it again."¹⁰

Some tribes of South Africa never remain in a place where death has once visited them.¹¹ On the Loango Coast after a death the hut of the deceased is abandoned, and if a prince dies the whole village is removed.¹² Such is the dread of death among the Sakalava of Madagascar that when it occurs in one of their villages they break up their settlement and remove to a distance before rebuilding their houses. "They seem to believe that the spirit of the deceased will haunt the spot, and do some harm to those who stayed where it had lived in the flesh. This perpetual fleeing before death, of course, prevents the population from becoming settled in its habits, and produces a most unsubstantial style of house-building." The same notion is found among other tribes on the island, some of whom call such deserted dwellings "broken houses." The idea prevails generally here that it is improper to use anything belonging to the

dead, which leads also to the burial of royal property among the Hovas.¹³ Again, to avoid the return of the ghost no more food is cooked after the funeral-ceremonies are finished, because "it made the dead man hungry."¹⁴ It was the usual custom in the Upper Congo to bury the owner in his house, and "it, together with any other houses he might own in the row, would be deserted, neglected and soon fall to ruin."¹⁵ Among the Batetela "all huts belonging to the deceased or his wives are burnt," or "the doorway of the house in which the deceased lived is closed with strings and the building is allowed to fall into ruins."¹⁶ The hut of the deceased, among the Atharaka, "must be vacated and allowed to rot away."¹⁷ Any misfortune will signify to the Mkamba of East Africa that the place he lives in is unlucky, and he will then move his village; the Mkikuyu must move his village on the death of his father or uncle, generally to a distance of some six or eight miles. "If a stranger comes to a village and dies in a hut there, the hut is completely abandoned if the owner belongs to the Kikuyu guild; a big hole is broken away in the side of the hut by taking out several of the wall slabs or planks; the corpse is left inside and the hyenas come and carry it off. The hut is then left to fall into ruin, and nothing is removed from it, such as cooking pots, beer, jars, etc. The men who break the hole in the wall are even considered unclean, the same as if they had handled the corpse, and after performing the duty go straight off into the bush and stay there until they have bathed and been anointed with *tatha* [the stomach-contents of a sheep]; finally a very old woman comes and shaves their heads, they are then ceremonially clean and can return to their families. A medicine man has, however, to come and purify the whole village in the usual way." Both groups also avoid the weapon with which a murder has been committed; "the idea apparently is that it contains a harmful essence which it is impossible to remove, and it is believed that the evil will be passed on to whoever picks it up."¹⁸ Among the Wawanga, a man returning from a raid, on which he has killed one of the enemy, may not enter his hut until he has taken cow-dung and rubbed it on the cheeks of the women and children of the village and purified himself by the sacrifice of a goat, a strip of skin from the forehead of which he wears round the right wrist during the following four days. Abandonment of the village, especially following the death of a father of twins or of the village-head, is common among these natives, the removal to another site taking place within three or four months after the death.¹⁹ In Nyassaland the roof is lifted bodily off the hut of the deceased and put on the ground, the walls are taken down and piled round the roof and the family live there till the mourning is finished. Then a pot of beer is broken over the roof of the hut as it lies on the ground. In some cases the hut is burned.²⁰ Among the Mombasa, "should a relative sicken he is promptly deserted, unless he be an elder, when he is carefully tended." An epidemic causes panic among these people so that they desert even babies.²¹

Some Nigerian tribes reoccupy a house on the death of the owner, although he may be buried in the porch itself. The Hausa advise never to enter a house in the dark, but always to get a light and hold it in front of you; so long as

you get past the threshold, you will be safe, even if the light goes out. Also, do not get up in the night and grope about in the dark, but strike a light before rising. By these precautions you will avoid encounter with a ghost. "On the night of the death, if the corpse is in the house, all the family and friends sit round it and talk all night, for anyone going to sleep would die. A knife is placed upon the breast of the corpse so as to keep the *kuruwa* [soul] from leaving it, and this, or another knife, will be kept by a wife during her three months odd of *takabba* [mourning] as a protection. A wife can hear it crying *chi-chi-chi*, and she is naturally frightened, so she tells some of her friends, and they abuse it until it has stopped, but she herself must not abuse it, else she would die. So sensitive of abuse is the *kuruwa* in Algiers, that no knife need be placed upon the corpse, the number of people present being sufficient protection for the widows. Animals are not allowed in the room, for they would make the *kuruwa* angry. Candles are kept alight for three nights, and the clothes of the deceased are washed at the end of three days."²²

The Yakuts say that "in ancient times, when any one died, the inhabitants fled from the house, leaving in it the corpse with all the goods which belonged to the person when he was alive. . . . In some districts the people who are a little well-to-do, in the case of a death, at once abandon the house, if not forever, at least for a time."²³ One Yakut theory is that the dead are eaten up by devils who lurk about the place where they found their victim.²⁴ Among the Kamchadales, "the house in which a person died was always deserted, and its inhabitants at once removed to another dwelling at a certain distance. With the corpse, his clothes were also thrown away, and any one who should wear these afterwards was believed to be in danger of an early death."²⁵ The Soyots of the Yenesei pay no attention to the sick until they see that they are likely to die; then they leave them to their fate. The corpse, with his clothes and other belongings, is abandoned in the forest; fear of the dead man's ghost keeps the people away, the burial-places being seldom visited. If the corpse is not disturbed by the wild beasts, the people conclude that the dead man was very bad, while they hold that good peoples' bodies speedily disappear.²⁶ "In ancient historic China, it was an established mourning custom to give up to the defunct even the dwelling in which he had lived and breathed his last, with all its belongings, the children removing elsewhere, to miserable huts of clay, destitute of all bedding and furniture;"²⁷ while in ancient Japan men fled from the neighborhood of death; "it was long the custom to abandon, either temporarily, or permanently, the house in which a death occurred."²⁸

Among the Nairs of India for fourteen days after a funeral all the members of the family are under pollution; they are untouchable, and any Nair who touches them must purify himself by a bath. "On the fourteenth day is the purificatory ceremony. The *Mārān* comes in the morning and gives everyone some oil. After smearing the body with this everyone goes and bathes, and comes back clad in white. The *Mārān* then sprinkles holy water, and a Brahmin priest purifies the house. There is generally a big feast for two days."²⁹ Since the Sema Nagas believe that the soul of the dead waits about in the house for some time after death, they postpone for a time the division of the deceased's

property, "to let the dead man's spirit go peaceably away first."³⁰ It used to be a common custom of the Todas to burn the house of a dead person.³¹ If a Palaung woman who has a small child wishes to take it into a house where someone lies dead, she gets soot from the bottom of the rice-pot and makes a black mark between the eyebrows of her child. A mother may not be satisfied with a small dab of soot, but may blacken the whole face of the child if she goes into a house where someone has died, either on the day of the death or on any of the seven days thereafter. "As the spirit of the dead person probably returns to the home where its body is lying, or has so recently lain, it is feared that the spirit of the baby, being weaker than the spirit of the dead person, may be driven out by it." If a sick child is apparently dying, the mother will attempt to call back the departing spirit: "Do not wander, do not fly from us into the dark night. The spirits may hurt thee, the fireflies may burn thee. Come back to me, O my child! Fall into this water, alight on this food. Here it is dark and cold, in our home the fire burns brightly on the hearth. I do not set thee free, I will not let thee go. I take and keep thy shadow, I take and hold thy spirit. Come back, come back, my darling child! come to me quickly." When people in the neighboring houses hear that cry, "they shut their doors, so that the wandering spirit may not mistake its own home and enter theirs."³²

The Malays very commonly abandoned or burnt the house in which a person died and sometimes even deserted the village.³³ In Borneo, "when a person dies the floor of the room in which he died is changed."³⁴ The Sakai desert a settlement if a member of it dies. "They said they did not bury a corpse, but left it in the abandoned house, for if they put a body into a grave, the spirit would not be able to make its escape upwards."³⁵ In Malacca, "invariably the house in which a person dies is burnt down and the place entirely forsaken, even at the possible loss of a coming crop of tapioca or sugar-cane."³⁶ The Kubus of Sumatra, in their wild state, "leave their dead unburied in the spot where they died, giving the place ever after a wide berth."³⁷ The Veddahs of Ceylon seek another cave, leaving that in which death has occurred to the spirit of the deceased.³⁸ In Car Nicobar the dying are removed to a mortuary hut in the graveyard in order to prevent defilement of the dwelling by death. After a native death, the author³⁹ took a walk into the village to see what the people were doing. "I found a fire in front of each house, the doors closed, and the people afraid even to talk to each other. Only a few old men had joined together, in a lonely house, to eat the mourning supper. When they saw me going about alone they were surprised, and asked me if I was not afraid of the ghost of the deceased man." The natives of Mindoro abandon a sick man when his condition becomes serious; after a time they steal back and, if the patient is recovering, aid him; if, as is more frequently the case, the man is dead, they flee, leaving everything in the house undisturbed and closing all paths to it with brush. The relatives then hide in the jungle, changing their names "to bring better luck."⁴⁰ In Samoa the house is abandoned to

the dead and to one or two relatives. All food is eaten outside; those who touched the corpse may not feed themselves but eat from mats or are fed by others.⁴¹ At the death of a person of importance the Maoris sped the departing spirit: flax cords were tied with a slip-knot to a tassel of the mat in which the body was enshrouded, one cord was placed in the hand of each of the boys and girls who were relatives of the deceased, and as the last word of the chant was uttered by the priest, "each child pulled the flax cord with a jerk, to disconnect the soul from the body, lest it should remain and afflict the relatives."⁴²

Among the Central Eskimo, if there is danger that a disease will prove fatal, a small snow hut is built, into which the patient is carried through an opening at the back. The opening is closed and subsequently a door is cut out. A small quantity of food is placed in the hut and the patient is left without attendants. If there is no fear of sudden death, the relatives and friends may come to visit him, but when death seems near the house is shut and he is left to die alone. If it happens that a person dies in a hut among its inmates, everything belonging to the hut is thrown away, even to the tools. The tent-poles may be used after a year has passed. This custom explains the isolation of the sick. If a child dies in a hut and the mother immediately rushes out with it, the contents of the hut may be saved.⁴³ The Tlinkits think it is terrible if the dying are not dressed for the tomb before life leaves the body. "This is to avoid touching the dead, of which they have a superstitious fear. We have seen men with their burial clothes on two or three days before death."⁴⁴

Among the North American Indians pretty generally, the dwelling of the deceased was deserted or, more commonly, burned, and the camp was often removed.⁴⁵ One reason why the Navaho built such crude houses was that religious custom constrained them to destroy or desert a dwelling in which death had occurred. Such a place was called by a term meaning "devil-house." "Those who now occupy good stone houses carry out the dying and let them expire outside, thus saving their dwellings, and indeed the same custom is sometimes practised in connection with the hogan [hut]. No people have greater dread of ghosts and mortuary remains."⁴⁶ The layers of burned clay so frequently found in southern mounds are, in part at least, the plastering of houses which have been destroyed by fire. "The numerous instances of this kind which have now been brought to light, and the presence of skeletons under the ashes and clay, render it probable that the houses were abandoned at the death of a member or members of the family, burned over them after they had been buried or covered with earth (for the bones are very rarely charred), and that immediately a mound was thrown over the ruins."⁴⁷

Not only did the American Indians desert or burn the house of the deceased, but they also gave away his clothing and weapons and other possessions or else destroyed them.⁴⁸ Furthermore, they regarded all persons who came into contact with the deceased to be unclean. Among the Zuni, emetics are taken by the corpse-bearers on their return from the cemetery and baths or hair-washes by the other survivors. "If those who have handled the corpse subsequently, i.e., within a day or so, feel unwell they inhale the smoke of piñon gum. If in dying the deceased has 'frightened' anyone, a lock of his hair may

be cut off and burned for the frightened one to inhale. Again if the deceased is thought of much by a survivor or dreamed of, the smoking piñon gum is inhaled. The name of the dead is taboo." During the four days it takes the deceased to journey to the spirit-land the mourners, that is, all the household-members, do not buy or sell, the house-door is left ajar, and the bowl used to wash the corpse and the tools used to bury it are left on the roof. At Acoma the possessions of the deceased are buried with him. The burial-company is made up of men, who afterwards wash their hair. For four days after death the spirit of the deceased lingers about home, but the house-door is not left open, as at Zufii, nor is trade tabooed. After four days the medicine-man brings to the house of the deceased the prayer feather-sticks he has made, places them where the deceased had lain, prays and bids the deceased begone. Meanwhile the household drinks a cedar-brew and vomits, and the father's kindred come in and wash their heads. The heads of a widower and of his children are washed by the women of his mother's household. The widower's head is washed after the burial also.⁴⁹

A great loss falls upon any family of Brazilian Indians which loses a member by death, for the hut is cleared out and all the things burned or packed in the basket with the bones, so that the spirit of the deceased may have no reason to come back.⁵⁰ The Guiana Indians abandon the village at a death; the body is buried in the house and all the possessions burned.⁵¹ The relatives of a deceased Jibaro Indian, especially of one killed by a lance, stand in such horror of the dead body that they hurriedly bury it on the same spot where they find it, thereafter speedily leaving the place.⁵² A survival is seen in the East Prussian custom of carefully cleaning the house, after a death, and carrying away the dust—all of which is supposed to accomplish the withdrawal of the deceased.⁵³

§223. Precautions against Return.

PRECAUTIONS against return have often, as will be seen, an exorcistic aspect. This topic, therefore, is closely related to that of exorcism.¹ In D'Entrecasteaux, one of the Melanesian groups, "if a man be properly buried his hamlet will never be haunted by his soul. This can only happen if no food be put in with him, or if he be laid upon his left side instead of upon his right. Not long ago the father of our old friend Yanavolewa was buried upon his left side, and his soul, instead of going off on its long journey, stayed behind to haunt his relatives. The sister watched one night and threw hot water in its eyes, after which it never appeared again. Sometimes a haunting soul is driven away with spears and clubs and the noise of drums and conch-shells, but it will inevitably return again if the natives afterwards fail to throw these objects into the sea." This use of water, noise, and weapons is a common method of expulsion. It is to be noted that precautions against the return of the ghost are taken at the time of death or burial or shortly thereafter, that is, before the ghost has gone to the other world, for "under ordinary circumstances the souls of the dead can never return once they have departed to their long home." Another common

¹ §§226, 227, below.

exorcistic element, fire, when employed at the time of burial, falls under the topic of precautions against return. "At the foot of the grave they make a fire to keep it warm and prevent the soul from walking. Sometimes they make another at the head, and a third on one side, but these are often omitted, while the fire at the foot is always lit. The grave-diggers keep them burning till the funeral feast is over, three or four days later."² In many cases in the Loyalty Islands, "burial took place in a grave dug in the ground, and the body was then usually bent with the knees up to the chest, as this was thought to prevent the deceased person from coming out of the grave and wandering about."³ When a dead body was laid in the grave, in the New Hebrides, a pig was taken to the place and its head chopped off and thrown into the grave to be buried with the body. "This was supposed to prevent disease spreading to other members of the family. With the dead were buried cups, pillows, and other things used by the deceased, and even the sticks with which the grave was dug. On the top of the grave they kindled a fire to enable the soul of the departed to rise to the sun." The natives did not eat anything which grew within about 100 yards of a place where their own dead were buried, but strangers from another district would pluck coconuts, and eat freely of such things as grew there.⁴ At Eddystone, Solomon Islands, whereas the general practice is scaffold-burial, "a man who died of a fall is buried and big stones placed on the top that he may not look back; a woman who dies in childbirth is also buried; lepers are buried or thrown into the sea."⁵ The precautions against return which are taken at San Cristoval consist in placing the corpse in a canoe with two men who paddle out to sea, another canoe with two men following; the dead man is then committed to the sea in the sitting position and the canoe in which he was brought is broken up, the four men returning in the remaining canoe.⁶ What chance now has the ghost of returning?

Among the Bageshu, a Bantu tribe, only people who have died from small-pox, together with suicides and thieves who have been killed in the act of entering a house by night, are buried; this is done because "they say they wish to suppress the disease, and in the other cases they are afraid of the ghosts." Among the Baganda, "bones of human beings are feared and avoided, and never disturbed unless it is absolutely necessary to move them. Sometimes a woman comes upon them when cultivating and must remove them; she either gathers them together with her hoe, to one side of her garden, and covers them with grass, or burns them. The ghost is always attached to them and fire is the safest and surest method of destroying it." A suicide is not buried, but burned at the crossroads, as the ghosts of those who take their own lives are especially to be feared. Among the cattle-raising Bahima, "the ghosts of the common people have no special abode, but wander about near the kraals. . . . The burial place of a commoner is always the dung heap in the kraal; the widow and relations guard the grave for three or four months to keep wild animals from disturbing the body; the kraal is then left, and a new one built some distance away."⁷ One may conclude that by that time there is no fear of the ghost's returning. The Akamba of East Africa drag into the bush the bodies of peasants and women, leaving them there for the hyænas to devour, while

chiefs, whose ghosts are much more to be feared, are buried in a deep grave in the village, the corpse being covered with earth and two or three big stones placed over the spot. The natives never cultivate on the site of a grave and the plants that spring up on it are never cut.⁸ It is common in this district to require a purification-ceremony in every case where a man kills another, while in some parts on every death the whole village is purified; the ceremony usually lasts but a few days, and may be regarded as a protective device against the return and malevolence of the ghosts of the slain. In deaths from an infectious disease in Kitui the corpse is dragged out by a cord round the neck. "For this work the elders are given a goat, and if the deceased's relatives are too poor or refuse to pay the fee the corpse cannot be disposed of at all, but will be left lying in the hut while the other members of the village will have to move elsewhere."⁹ This seemingly sanitary device is prompted solely by ghost-fear, for the natives think all disease is caused by evil spirits. Among the Wawanga, the dead man's chief wife remains in the hut where the body is buried during the following two months for the purpose of tending the fire. After this the hut is broken down and stones and thorny branches are placed upon the grave, all of which may be regarded as precautions against return. Since it is naturally difficult to escape out of a swamp, persons killed by lightning and dead children who are monstrosities are buried in swamps, with the idea of preventing the ghosts from returning to the village. Suicides and people who have come by a violent death are not buried in the hut but in the kraal. In one of these districts, while all married men and women who are very old are buried, other women and children are thrown to the hyenas; the ghosts of the latter, being much less powerful, do not call for careful treatment.¹⁰

The negro slaves brought over to the New World many superstitions concerning ghosts, some of which relate to methods of thwarting or misleading these disembodied spirits. The following are examples. To feel a hot breath of air strike you at twilight signifies the presence of a ghost near at hand. Should you wish to avoid him, stop and turn your coat and trousers and hat wrong-side-out and the spirit cannot encounter you. If, however, he is a pugnacious sprite and approaches in spite of the change, turn and address him thus: "In the name of the Lord, what do you want?" Whereupon he will tell you his business upon earth, then depart and never trouble you again. If, on the other hand, it is a prowling ghost which crawls under the house, bumps against the floor, makes strange sounds, and whispers in the midnight hours, you have only to put in a new floor and he will do so no more. Some ghosts are obtrusive and will not only prowl about the house, but creep in through the cat-hole or under the crack of the door during the small hours of the night, and, once inside, expand to vast proportions. To spare yourself any disturbance of this sort, sow mustard-seed all about the doorstep before going to bed, or place a sieve there. Before entering, the spirit will have to count all the holes in the sieve or all the mustard seeds, and by this time daylight will have come and he will have to go. As the counting on one night will not do for another, you are always safe.¹¹

¹¹ *Southern Workman*, quoted in *New Haven Journal-Courier*, May 31, 1912; cases in Puckett, *Folk Beliefs of the Southern Negro*.

The reindeer Koryak in Siberia had a method of misleading the ghost which consisted in a relative of the deceased walking round the pyre, first from right to left and then from left to right, "in order to confuse his tracks so that the dead might not follow him." He then took a few steps in the direction of the house, drew a line on the ground, jumped over it and shook himself, the rest of the burial-party doing likewise; "this was supposed to have the effect of forming a large river between the village and the funeral pyre." It is known, of course, that ghosts cannot cross water. The pastoral people of the Baikal province bury their dead in the ground and, as they return from the funeral ceremony, "the relatives try to obliterate the tracks they have made in the snow, or else cut down trees so that they fall across the way, in order to prevent the return of the dead." The Buryat either slaughter a horse near the grave or set one free; in the latter case, "should it return home it is driven away, because they fear it." For three days after the death they do no work, but remain at home; during this time the soul of the deceased wanders round his former habitation. On the third day the relatives hold a feast for their friends. This custom becomes perfectly intelligible when it is remembered that the Buryat, like the Yakut and other aborigines of Siberia, needs a horse in order that his soul may make the journey to the abode of the departed. If the horse is slaughtered, well enough, but if it is merely set free there is danger that it may return home rather than wander at large upon the steppes, and bring the ghost with it. Such an animal is always taboo. Further precautions taken by these peoples are, on the death of a child, to place its cradle on the grave and its toys on the nearest tree, rather than to keep these things in the house. While at the burial of an adult "a great wind is held to be favourable, as it will smooth out the tracks on the way to the place of the funeral, otherwise many of the living will follow the dead."¹²

In the Punjab province of India, "if a woman die within thirteen days of her delivery it is believed that she will return in the guise of a malignant spirit to torment her husband and family. To avert this a *shānti* is performed at her funeral, a piece of red cloth and the grass image of her child being placed on the bier. Some people also drive nails through her head and eyes, while others also fasten nails on either side of the door of their house."¹³ Should a Sema Naga mother die in childbirth, "she is taken out by the back door and buried behind the house. The husband in such a case is *genna* [taboo] for eleven days." All the dead woman's beads, ornaments, and clothes are thrown away, and her husband's personal property is not touched by anyone "for a year," that is, until after the next harvest. "Even then all utensils, etc., are got rid of as soon as they can be replaced, and no one will touch them except the aged."¹⁴ If a Palaung woman dies in childbirth, "her body is hurriedly washed and dressed in new clothes, the coins are tied to the wrists, and the usual food and other things are placed beside her in a new mat, which is wrapped round her body. She is then lowered through a hole which has been cut in the flooring-boards of the room where she died. As the desire of every one is to remove her body from the house and the village as quickly as possible for burial, a coffin is not made. . . . As soon as the body has been lowered, the floor is washed and the hole is closed with new boards. This, they hope, will prevent

the return of the spirits of the unfortunate mother and child, to Palaungs the most terrifying of unhappy spirits. . . . If a pregnant woman dies, no woman still capable of child-bearing and no girl should go into the house of the dead woman until the body has been removed. When the funeral has taken place, the mourners in the house may be visited by girls and young unmarried women, who should accept no food there until seven days have passed. They fear that if they eat in the house before the spirit of the dead woman has gone to eat of the fruit of forgetfulness, a similar fate may befall them should they marry." The author¹⁵ who describes this case with much insight goes on to explain other precautions against the return of the ghost. Sometimes the coffin of the deceased is carried round the house before starting for the graveyard. "A man walks in front of the coffin carrying a lighted torch, even if the sun is shining brightly. After the grave has been filled with earth, the torch is laid on the top and there burns itself out. . . . Some say that the way in which a dead person is carried makes no difference to his spirit, but that if his feet point towards the village there will be many deaths there; others think that the ghost might return to his home and remain there if the body had not been carried in the right way." After the interment is completed, some clans place a stick in the path a short way from the graveyard and conjure the spirit of the departed not to pass it.¹⁶

Among the Dusuns of North Borneo, the ghosts of the dead, whose home is supposed to be at the top of Mount Kinabalu, are thought to be capable of loitering on their way thither and causing trouble, for when a death has recently occurred the old women will weep and call to the spirit: "Do not stop here, for your way lies to the left," that is, to Kinabalu; and natives always avoid graveyards as much as possible. "The bier on which the body has been carried is, in some cases, cut to pieces at the grave-side, probably in order to prevent the return of the ghost, and in others, the men on returning from a funeral slash with their *parangs* or chopping knives at the steps of the house and at the door of the room in which a death has occurred; the object here, again, being to prevent the soul from lingering near the house and bringing evil upon its inhabitants." The Sakai believe that evil spirits collect about the graves where food is placed and feast for a period of six days; the spirits of the dead are very much feared, and children are not allowed to go out after dark during the whole of that time.¹⁷ "Those of the mourners who leave the grave last plant sharpened stakes in the ground, so that the spirit of the dead man may not follow them back to the Dyak house, the stakes planted in the ground being supposed to prevent his return."¹⁸ Like the Finns, the Dyaks also close the grave with a fence too high for the ghost to "take" it, especially without a run.¹⁹ The Sea Dyaks of Sarawak greatly fear that the dead, having become the victims of the most terrible of all powers, may harbor envious feelings, and possibly follow the burial-party back to their homes with evil intent. In order to prevent this, some of them will make a notched-stick ladder, and fix it upside down in the path near the cemetery to stop any departed spirit who may be starting on questionable wanderings; others plant bits of stick to imitate bamboo caltrops to lame their feet should they venture in pursuit.

Another method of making it difficult for the spirit to find its way back home is to throw ashes after the corpse as it is being borne from the house. In some instances, ashes are strewn in front of each house before which the funeral procession passes. Some natives of the Indian Archipelago take the body to the grave in the dead of night and then, to make it still more difficult for the ghost to find the way home, they carefully obliterate their footprints. The crouching position of the corpse when buried is regarded by Wilken,²⁰ who has reported these cases, as an attempt to hinder the dead man from getting out of the grave; since it is usually bound into this position, the practice may be added to the other precautions against return. In northern Sumatra, for safety's sake, the corpse must be buried the day of the death and well before sundown.²¹ In Formosa, at leaving the grave each man flings a handful of earth at the wooden slab they have erected and spits upon it, with a warning in formula not to think of returning. "If, in spite of this warning he persists in returning, he must understand that the spitting and stoning just performed is a sample of what his reception will be then."²² In Samoa it was supposed that if the possessions of the deceased were left and handled by others, further disease and death would be the consequence.²³ The Hawaiians thought a spirit much stronger than a human being—hence the custom of covering the grave with a great heap of stone or modern masonry to keep down the ghost.²⁴

In the belief of the Lenape Indians of Canada, a new-born child did not obtain a firm hold on this world for some time after its arrival, its little spirit being easily coaxed away by the ever-present ghosts of the dead. "For this reason it was wrapped as soon as possible in adult's clothing, by way of disguise, so that the ghosts would not notice it was new-born. Similarly deer-skin strings or strips of corn-husk were tied on the wrists of children so that the ghosts would think they were tied fast to earth; and holes were cut in their little moccasins so that they could not follow the spirit trail. If the child's mother died shortly after its birth, these precautions were redoubled."²⁵ It was believed by the Omaha that "the spirit of a murdered man was inclined to come back to his village to punish the people. To prevent a murdered man from haunting his village he was turned face downward, and to impede his steps the soles of his feet were slit lengthwise. . . . Such a haunting spirit was supposed to bring famine. To avert this disaster, when a murdered man was buried, besides the precautions already mentioned, a piece of fat was put in his right hand, so that if he should come to the village he would bring plenty rather than famine, fat being the symbol of plenty. Even the relatives of the murdered man would treat the body of their kinsman in the manner described."²⁶ Precautions against return, on the Orinoco, consist in rooting up the fields which the deceased has planted; they say they do it to destroy all memory of the deceased. The Island Caribs put two weights on the eyes of the deceased, "so that he may not see his parents and thus make them ill."²⁷ The notion that if the eyes of the dead be not closed his ghost will return to fetch away another of the household, still exists in Bohemia, Germany, and England.²⁸

"*Doors of the Dead.*" A custom resting on the belief that a corpse must not pass through any of the regular doors but must be carried out of the house by some other exit appears among the Ashantis, Zulus, Haussas, and a number of tribes of west central Africa.²⁹ After the South Africans have taken the trouble to break out a special door for the dead, the hut is nevertheless usually abandoned.³⁰

The Hyperboreans regularly take the corpse out through a hole made for the purpose.³¹ The Koryak do not carry out their dead through the usual door, but under the edge of the tent-cover, which is lifted up. Other tribes of this section remove the corpse through a window or through a specially-made hole.³² When a Samoyed dies, "various precautions are taken to prevent the spirit of the dead returning to visit the living. For example, the dead body is not carried out of the room through the usual opening, but under the skin or bark wall nearest to the spot where the body lay at the moment of death."³³ Anuchin³⁴ confirms this information, and adds: "According to the folk-tales, wizards always die with great difficulty; in order to lessen their sufferings a beam in the ceiling is raised, and the bodies of such persons are taken out, not through the door, but through the window. . . . Even at the present day when a person lies long in the agonies of death, it is customary to raise a beam in the ceiling in order to help his soul to leave the body; hence the proverb, 'the beam cracks, somebody will die.'" This case represents the close connection between speeding the soul's departure and preventing its return. Among the Lolos of West China, "after death a hole is made with a pole in the roof of the house to enable the breath or soul to escape;"³⁵ while it is a general practice in China that "if the dead died in the flower of life or in full manhood, one of the first things for the family to do is to open one of the skylights, in order to allow the disastrous influences, which have caused the death and might attack others also, to escape from the house. . . . Many Chinese hold that the window is simply unclosed for the convenience of the soul, which ought to be allowed to wander freely in and out."³⁶ In the Naga Hills of India, there are small dead-houses, with windows left at the side for the escape of the ghosts. Fires burn in front of these resting-places.³⁷ In the Chittagong Hills, "on returning from the funeral pyre, all parties bathe themselves. If the master of the house has died, the ladder leading up to the house is thrown down, and they must make an entrance by cutting a hole in the back wall and so creeping up."³⁸ The idea here seems to be that the ghost, not being able to utilize the ladder, cannot enter.

"The Siamese, not content with carrying the dead man out by a special opening, endeavour to make assurance doubly sure by hurrying him three times round the house at full speed—a proceeding well calculated to bewilder the poor soul in the coffin."³⁹ The same custom prevails among the Alfurs, while some of the natives of southeast Borneo will rush with the corpse to the grave, hastily bury it, and then hurry away as fast as possible. Doors of the dead are quite common among the Malayo-Polynesians and have persisted longest

in connection with suicides and criminals, whose ghosts are feared above all others. In those regions, as in the Minahasa, where the houses stand on piles, an opening is made in the floor for the purpose of removing the dead; while among other tribes there is in the dwelling a sort of window which reaches down to the floor, constructed in such a way that it can be used as a door for the dead.⁴⁰ Again, several boards may be removed and an opening made upon the veranda.⁴¹

"Doors of the dead" are not to be confused with mere exits from the grave, which are common enough. For instance, the Easter Islanders, who bury the illustrious in stone structures, always take precaution to leave two holes free through which the soul can eventually find exit.⁴²

Corpses are taken out of the Eskimo house through a window, out of a tent by cutting a hole in the back of it. In Norway an opening is made in the wall. When the body is carried out a woman sets fire to a piece of wood and waves it about, saying, "There is nothing more to be had here." This is to show the soul that there is no property which it may come back for.⁴³ In the Hudson Bay Territory, "the nearest relatives on approach of death remove the invalid to the outside of the house, for if he should die within he must not be carried out through the door but through a hole cut in the side wall, which must then be carefully closed to prevent the spirit of the person from returning."⁴⁴ The Bering Strait Eskimo, after tying the corpse with strong cords, draw it up through the smoke-hole in the roof. Among the Tlinkits of Alaska, in the days of cremation and even later, "dead bodies were never taken through the door, but through a hole made in the side of the house and then closed up so that the spirit of the deceased could not find its way back into the house. Or the body was taken through the aperture in the roof and a dog taken along with it. If the dog were not taken they believed that some one of the family would surely die, but if the spirit of the deceased entered the dog it would not return to the injury of any member of the household."⁴⁵ The Dakotas always make a new opening for removal of the corpse.⁴⁶ Among the Kwakiutl, after a child has died, the body is taken out through a hole made in the side of the house by pulling out some planks. The mother of the dead gives all the best food and clothes to other women to burn behind the village, while she herself throws food into the fire of her house for four days. If a child belonging to the nobility dies, the roof-boards of his father's house are all pulled down, which custom is called "craziness strikes . . . on account of the beloved one who died."⁴⁷

Among the Old Norse the dead could not be removed through the door through which the living went in and out. The people tore down a piece of the wall behind the head of the corpse and dragged it out backwards, or they dug a hole under the bottom of the south wall, through which the body was taken. This was also a common German custom. We find it observed in both North and South Germany in the case of malefactors and suicides who were dragged out, not through the door but under the threshold or through the wall. In this case the practice is an indignity, for these bodies are regarded as unclean,

whereas in heathen days, when every dead man was regarded as something gruesome and dangerous, it was done to all.⁴⁸

Taboo on the Name of the Dead. The Tasmanians had great fear of pronouncing the name by which a deceased friend was known, as if his shade might thus be offended. "To introduce, for any purpose whatever, the name of any one of their deceased relatives, called up at once a frown of horror and indignation, from a fear that it would be followed by some dire calamity."⁴⁹ In D'Entrecasteaux, "the names of the dead must not be mentioned, at least not before their memory has begun to fade," which would indicate a fear of summoning the ghost. The authors⁵⁰ one day asked some youths the name of an insect which lay on the path in front of them. "A small boy told us without any hesitation, but an older lad immediately reproved him, saying, 'Hush, you must not say that name; you know the man is dead.' For a time the natives had to call it simply *manuga* (bird or insect). Any adult or child in that district whose name might be the same was obliged to drop it at once and take another." Such a name was unlucky or unclean, as it was connected with the dead; it was taboo.

The same practice is quite common among the Papuo-Melanesians, and the word *polola* among the southern Massim was used to designate the custom by which any word resembling the name of a deceased person is replaced by another word. "If the name of the dead is inadvertently repeated by a child or a stranger, someone says, 'Hush, that is *polola*,' and if a word with a similar sound is pronounced the speaker is told what the new word is; thus a man named Binama (his totem by-the-bye was *binama*, the hornbill) died and all the people of Taupota, whether of his own or other clans, adopted the new name *ambadina* (literally 'the plasterer') for the bird." In a number of places, as no man's name is mentioned after his death, and since people are commonly named after their elder clansmen, a large amount of name-changing takes place. Children are always re-named after the death of their name-sakes, usually maternal aunts and uncles. So flagrant an insult is it to mention the name of the deceased that a man would fight if the name of his dead father or other relative were uttered in his presence. Though among some of these groups the names of the dead are not so stringently avoided, yet "a certain delicacy exists about speaking them," the names of near relatives are not used for some time after a death, while a widow or widower is always spoken of by a special term until he or she marries again or removes the black mourning-pigment with which the body is covered.⁵¹

Among the Kaffirs, after the death of a chief, his name and all words like it are dropped from the language.⁵² In the Upper Congo "the names of the dead are seldom mentioned, and always avoided if possible." A fisherman will take the utmost care to conceal his name while fishing, lest a ghostly enemy should hear it and divert all the fish from his traps and nets.⁵³ Among the Wagogo of East Africa the name of the dead is not mentioned without a prefix which means: absent, deceased, invisible;⁵⁴ while among the Lumbwa "the name of

the deceased is not mentioned after death until a child is born to his family group when, should it cry when his name is called, it receives his name; the deceased is referred to as *kimaitet*, the dead one."⁵⁵ In Nigeria, "it is forbidden ever to talk of ghosts."⁵⁶

In China if a child is born after several have died, the father "makes out after a name," that is, he goes out on the street and names the child from the first object he happens to see or the first word he hears. The deaths of the former children have been due to unlucky names; if the name is left to chance, one may be hit upon one which will not attract spiritual attention.⁵⁷ The Todas of India are by no means free from the idea that danger attends disrespect connected with the utterance of names. There are several conditions which lead Todas to change their names. If two men have the same name, and one of them should die, the other man would change his name, "since the taboo on the name of the dead would prevent people from uttering the name of the living." This change may be effected even when there is no more than a similarity between two names. Another reason for change is illness or other misfortune. "A man may not utter the names of his mother's brother, his grandfather and grandmother, his wife's mother, and of the man from whom he has received his wife, who is usually the wife's father. The names of the above are tabooed in life, while after death the restrictions are still wider, and it is forbidden to utter the name of any dead elder relative, while the names of the dead are in any case only said reluctantly." In addition to the definite taboos, there is often much reluctance in uttering personal names. "The Todas dislike uttering their own names, and a Toda, when asked for his name, would often request another man to give it."⁵⁸ This latter practice has appeared above;⁵⁹ it re-emphasizes the force of the taboo on the names of the dead. "Some of the most powerful *kar-nam* [spirits or ghosts] have special names, but the Palaungs are unwilling to utter them, considering it irreverent."⁶⁰ These Palaungs consider that if they mention the name of their chief it should be whispered. In Nukuoro, it is forbidden to mention the name of a native after death, and the taboo applies also to the name of the living chief.⁶¹ The Tahitians drop from their language all words and syllables which resemble the names of the deceased kings and their relatives.⁶²

The Greenlanders are much afraid of mentioning the names of the dead. Some think that the old names reappear when the deceased is forgotten, others that the word comes into use again when a child has been named after the deceased.⁶³ Holm⁶⁴ tells of a man who, "after having recounted his mother's death and burial, wanted to be paid for it, so that, as he said, the dead should not be angry." There is an account of how King Philip came to Nantucket to kill a man who had spoken the name of one of the Indian's dead relatives.⁶⁵ Mourning, among the Dakotas, "is kept up one year, amidst dirt and ragged garments; they then wash themselves, put on clean clothes, and never mention the name or allude to the dead person, and it is considered a deadly insult that the name of the departed should be mentioned in their presence." When

a child is sick the father will take the child's name, believing it will cause others of the family to die if the name should die.⁶⁶ Dorsey⁶⁷ mentions four Siouan tribes which were exceptional in not holding to the name-taboo; when their relatives died, they did not cease to refer to them by name, "nor did their deaths involve the change of name for a single object or phenomenon. It was a very common occurrence for the name of the deceased to be assumed by a surviving kinsman." The Navaho give the impression of having forgotten the deceased, as his name is never spoken.⁶⁸ The Karok of California regard the mere mention of a dead relative's name as a deadly insult, to be atoned for "only by the same amount of blood-money paid for wilful murder."⁶⁹ Like many other Indians, the Apache would never utter their own names nor on any account speak of a dead member of the tribe.⁷⁰ In Paraguay all the members of a family, at the death even of one of the slaves, changed their names, "in naïve precaution, that the ghost might not find them if he returned."⁷¹ Among the Fuegians, "the mourning lasts long, sometimes for two years, but it gradually becomes less, till the memory of the dead passes from the mind. The name of the dead is not mentioned to the mourners, as it is considered very offensive, and would endanger a person's life. On this account it is impossible to trace back by name the ancestors of these people more than three generations."⁷²

The African term "hlonipa" has been used to describe the general taboo on names, whether they be those of the dead or of tabooed relationships. Connected with it is the custom not to speak ill of the dead or to take the name of the deity in vain. Since personal names are often the same as the names of objects, this name-taboo has an impoverishing effect on language.⁷³

§224. Disguise and other Forms of "Mourning."

THERE is said to be very little sentiment concerning death among the natives of Central Australia; they laugh at the contortions of anyone dying. "But immediately a death occurs all the camp unites in a dirgeful crying, which is kept up every night for a week." If a man dies his widow makes a mourning-cap of burnt gypsum, which is placed on her head in a plastic condition, weighing often up to eleven pounds. The cap fits right over the top of the skull down to a line with the eyes in front, and is about three-quarters of an inch thick; it is worn for a week, a month, or longer. In one place they hit the relatives on the head, during the burial, "to make 'em sorry."¹ In North Central Australia if a woman neglects to cut herself as a mark of sorrow on the death of a daughter, blood or tribal, another woman will go in search of her and, failing the chance of killing her, will strike one of the offending woman's brothers.² Among the tribes of West Australia, "when a man or woman is near to death the relatives often throw themselves on the body of the sick person and weep loudly. After

the death the relatives, both male and female, wail and cut their scalps until the blood trickles from their heads. The hair of the deceased is cut off and preserved, being worn by the relatives in the form of string. . . . The relatives of a dead man or woman are required during the period of mourning to abstain from eating the flesh of kangaroo. This was in former times the principal meat food of the natives."³

Self-mutilation, smearing the face or body with pigment, special treatment of the hair, and fasting are common forms of mourning in Melanesia. In San Cristoval, Solomon Islands, a widow shaves her head completely for a month, and then allows horizontal bands of hair to grow one at a time till her head is again completely covered. This is done by a widower also, while either may go about covered with a sort of cowl.⁴ The period of mourning in another island of the same group generally lasts from eighty to two hundred days, during which time the widow may not leave the village. "She will not allow a drop of water to touch her body, nor a comb or knife to touch her head. Her hair grows long, and in a few months she is a most miserable and pitiable object to behold. Thus she lives to express her sorrow."⁵ Neglect of personal cleanliness, a rather common method of showing bereavement, prevails on the Loyalty Islands, accompanied by mutilation, the perforated lobe of the ear being torn open and the mourners sometimes cutting their bodies.⁶ In D'Entrecasteaux a widow usually goes to her parents' hamlet before the funeral is over, where she fasts for two days, then blackens her body and face with charcoal. "In the hamlet of the deceased, about day-break on the morning after the funeral, the kinsfolk also blacken their bodies, shave their heads, and put on white cane armlets; then, if their grief should overwhelm them, they break the dead man's pots and his canoe, perhaps even cut down his yam vines and banana trees and such of his coco-nut palms as chance to be in bearing." The mourners never mutilate themselves, "save when some woman works herself into a frenzy and hacks her body with a shell." All who have taken part in the burial must purify themselves as soon as they return to the hamlet. A near relative of the deceased sets a pot of water on the fire.⁷ Black is the sign of mourning in New Hebrides, and is obtained by mixing oil and pounded charcoal, some of the natives making their faces glisten like the work of a bootblack. There is great wailing at death, and the mourners scratch their faces till they stream with blood.⁸ Blackening the body, cutting the hair and gashing the scalp are mourning-practices among other Melanesians,⁹ while abstention is stressed in some cases, as in British New Guinea, for instance, where the relatives must abstain not only from noisy amusements but also from the use of red paint on their bodies, and the male relatives must wear nothing that is painted any color; after the funeral the nearest relative of the deceased must disappear entirely from sight; "enveloped in a rude bark cloth covering, he must spend the days hidden from sight, and pass the nights weeping on the grave."¹⁰ In Tikopia Island the period of mourning is long; all the relatives drink only water and eat only mammy apples for four or five months and they often abstain from coconuts, taro, yams and fish for as long as a year. In addition

to fasting, a widow shows her loss by making a number of burns on her face with a brand from the fire. She cuts off her husband's hair and wears it round her head till her death; she breaks the lobes of her ears and always keeps her hair short.¹¹ In Santa Cruz and Reef Island on the day of his death a man's wife and those in the house begin to fast: they renounce cooked food, some for about a week, some for a very long time; and every day they smear their bodies and faces with charcoal. The widow puts on her head a torn and dirty cloth and does not go about but lives like a prisoner. She remains always at the place where her husband is to be buried; and they bury him on the very spot where he died.

The widow, as has been seen in the above cases and as will be observed in those to follow, is the most important of the mourners. Among the Papuans it is held that the husband's spirit, thought to be most malignant immediately after the death of the body, close to which it hovers for about two or three months, pitches upon the widow as the particular object of its malignity. It is for this reason that "she will wear a piece of hair taken from her dead husband, suspended by a piece of bark or cord from her neck, and also other signs of mourning, in order to placate his Oboro [evil spirit]. His blood relatives, too, adopt mourning for the same purpose," but in their case the requirements are not so strict.¹² Here as elsewhere in primitive society the man is much more important when living and so, when dead, must be more elaborately mourned. He usually gets a better burial. Power, respect, awe, ghost-fear are commingled factors.

Disguise is very clearly the object of the mourning-customs of some negroes of the Gold Coast, for the men go to the grave with the funeral-procession dressed as women and the women dressed as men.¹³ Disguise from the evil spirits is implicit at least in the mourning-customs of the Bangala of the Upper Congo. When mourning the body is smeared over with white clay or chalk and the sackcloth-and-ashes usage is followed. The widow either goes absolutely naked or dresses in a few leaves, and rubs dirt on the body. "For six weeks or two months they walk only in the bush, and if they hear anyone coming they hide, and during this time they may not walk about the town; then for another three or four months they wear long untidy-looking grass clothes." A man while mourning for a relative or a wife wears rags or an old string fish net, and allows his body to go unrubbed with oil and camwood powder. "Utter disregard of one's personal appearance was a sign of great grief. Men also at times wore a woman's dress instead of a man's in token of sorrow, and would shave half the hair off, or do it up in little bunches or knots, and shave the hair off the spaces between them. Some would rub their bodies with clay." In the majority of cases, the author¹⁴ thinks, there is more noise and show than grief. Their word for sorrow is *nkele*, which really means anger, indignation, and "the idea is that they are 'angry' that their relative has been done to death by the *Moloki* [witch]. There is no other word for grief at the death of anyone than this *nkele*." Among another tribe of the Congo basin the relatives take off all adornment, and "men and women wear as a sign of mourning their hair as Nature gave it to them."¹⁵ Both Bahima and Baganda wear bark cloths as mourning-clothes; in the latter case the hair is unkempt, the nails grow to

talons, and on the chest a white patch is made with water and ashes. A woman's funeral is the same as a peasant's, while in the case of children no two bodies would be put in the same grave lest the ghosts quarrel over the "right of ownership."¹⁶ In East Central Africa women lament for several days over the dead, and guns are fired to keep off the evil spirits.¹⁷ Among the Wawanga of East Africa, if the deceased be a male, the mourning-ceremony is as follows: on the first day, the corpse is buried, everybody bathes, a fowl is killed in the evening, and there are great lamentations; on the second, there are lamentations only; on the third, there are lamentations and the mourners shave their heads; on the fourth, they kill a bullock or other animal, and sweep up. If the departed be a woman, the mourning lasts but three days and is the same as in the case of a male, with the exception that the lamentations are omitted.¹⁸ With the Kavirondo, "the wailing is kept up in the case of a chief for six days, and performed twice a day, at sunrise and sunset, but after the day of the dance each village mourns by itself; for a common person three days is the limit."¹⁹ In Kenya Colony, the widows discard all ornaments, the eldest son wears his garments inside out, as does the youngest daughter on the death of her mother, while members of the family may not have sexual intercourse until the shaven hair of the head begins to grow again; marriage and other ceremonies are postponed.²⁰ Among the Hausa "the ordinary work of the house is suspended when a death takes place, this being to show that the women are too sad to work: if they went about their ordinary duties, people would think that they did not care. Men should not work on the day of the actual death or of the funeral, but may do so directly after the last rites, when these take place in the morning, i.e., on the day following the death."²¹

In excess of grief, orphaned daughters among the Mordva scratch their cheeks with their finger-nails.²² Among a number of Dyak tribes the death-chamber is taboo for seven days and nights following a death, else the ghost will haunt the house. Music, noisy mirth, ornaments and gay clothing are tabooed during the family-mourning, which lasts forty days. White is the mourning-color; and every male must shave his head.²³ In the East Indies the time preceding the feast to the dead is a dangerous period; people disguise themselves and abstain from customary occupations. Among the Alfurs of Minahasa the widower must keep to his room for five, seven, nine, or eleven days; in some cases the seclusion lasts a month. The painting of the face or body, which is such a general mourning-practice, is here very specifically done for the purpose of disguise, to protect the living from the dead. Black is the common mourning-color, usually obtained from powdered charcoal and oil. Another method of disguise found throughout the Indian Archipelago is a complete change of clothes. One must wear clothing quite different from the ordinary: dark for light, and especially old and ragged garments. Women must cover the head, which is usually bare, with a mourning-cap, which corresponds to the veil with us; these caps are sometimes three feet in diameter and afford considerable seclusion. All ornaments that cannot be laid aside must be covered. In Celebes the men too must wear large caps, while among the Buginese and some of the Dyaks they wear no trousers during the time of mourning

but a cloth around the loins, or they tear their sarongs and go about with either the upper or lower part of the body naked. A third general method of disguise is to cut or otherwise alter the hair. The change this makes upon the appearance is remarkable, especially with the women. The shearing of the hair is regarded by Frazer and other authorities as a means of disguise, but Wilken²⁴ who has reported these practices from the Indian Archipelago, is of the opinion that this custom was originally a sacrificial act and that only later did it become a sign of mourning. Among some of the tribes of the Malay Peninsula the mourners hit their heads on the wall and the women tie cloths round their necks "as if to strangle themselves." The men interfere before any harm is done.²⁵ Formerly, it is said, the women put an end to their lives by strangling; if this is so, the practice cited is survivalistic.

The Samoans exhibited the most frantic expressions of grief, such as rending the garments, tearing the hair, thumping the face and eyes, burning the body with small piercing firebrands, beating the head with stones till the blood ran. This they called an "offering of blood" for the dead. "While a dead body was in the house no food was eaten under the same roof; the family had their meals outside, or in another house. Those who attended the deceased were most careful not to handle food, and for days were fed by others as if they were helpless infants." In Samoa, "the fifth day was a day of 'purification.' They bathed the face and hands with hot water, and then they were 'clean,' and resumed the usual time and mode of eating." Among the Savage Islanders the women, on the death of their husbands, singed off the hair of their heads, as a token of mourning. For fourteen nights after a burial, in the Tonga Islands, "the men would approach the mount, and pay their devotions to the goddess Cloacina, after which they retired to their homes. At daybreak next morning, all the women of the first rank, the wives and daughters of the greatest chiefs, would assemble, and with expressions of profoundest humility, would make the place perfectly clean."²⁶ This ceremony, which is probably an exorcistic device, the author thinks has no parallel in the burial-rites of the world. In the Caroline Islands the nearest mourners cut off the hair and beard, throwing them on the corpse; they fast rigorously all the day, leaving food at the tomb for the soul to eat, and then on the following night they feast.²⁷

The Aleuts had a practice of putting a mask over the face of a dead person when the body was laid in some rock-shelter. "The departed one was supposed to be gone on his journey to the land of spirits, and he was masked to protect him against their glances."²⁸ The Tlinkit widow wears a coarse blanket as token of bereavement. Most of the time she lies hunched up on the floor beside the body and as silent as the corpse itself. Her hair is shorn and her face painted black all over.²⁹ The Indian mourners, in the Northwest, had "their faces painted black, their hair cut short, and sometimes their heads covered with eagle's down."³⁰ Four days after a Kwakiutl child has died, some non-relative is called in to cut the hair of the mother, father, and the child's brothers; "it is bad if relatives cut the hair. When they cut the hair, it is just as though they were cutting the throats of the relatives."³¹ Both widows and widowers, among the Indians of British Columbia, had to undergo continuous

ceremonial washings or cleansings. The body of the deceased also was washed, the hair combed and tied back, the face painted, and the head sprinkled with the down of bull-rushes, "which was potent in checking the evil influences attending corpses." The mourners observed the usual custom of cutting the hair, the manner in which it was done indicating the depth of the mourners' sorrow. "A shorn head, therefore, among them had much the same significance as deep crape garments among ourselves."³² The Dakotas mourned unkempt, besmeared with earth, in dirt and rags, for a year, and the women gashed themselves with knives.³³ Mourners among the Omaha seem to have found relief from sorrow by inflicting physical pain—slashing their arms and legs; to cut locks of hair and throw them on the body was a customary expression of grief, as was wailing. "Abandonment of all that otherwise would be prized seems to have been characteristic of the Omaha expression of grief . . . it might happen while the tribe was on the annual hunt that a woman who had left the camp to gather wild potatoes would suddenly remember the fondness of a lost child for these roots; on her return she would take the store she had gathered to the center of the tribal circle and there throw down the product of her digging and return empty-handed to her tent. Her act was recognized by all the people as that of a person in sorrow whose thought was fixed on the dead and whose grief made her careless of present physical wants."³⁴ Mourners among both Neutrals and Apache blackened their faces, and in the former instance they also blackened the face of the dead.³⁵ On the death of any member of a Kiowa family, all the rest take new names; similarly among other tribes and in Virginia three hundred years ago.³⁶ Among the Navahos, relatives at a funeral "protected themselves from the evil influence by smearing their naked bodies with tar from the piñon tree;" the forehead and the face under the eyes were thus discolored and the tar remained till it wore off.³⁷ The mourning mother, among the Diggers, singed her hair off, mixed the ashes with charcoal and pitch, and streaked her chin, cheeks, and forehead;³⁸ the Yokaia widow's procedure was not dissimilar, except that the ashes used were those of her husband.³⁹ A mourning-custom common to all parts of the country is that of putting clay on the head and sometimes on the joints of the arms and legs.⁴⁰

Certain Brazilian tribes let the hair grow and color the face black to indicate mourning;⁴¹ in Paraguay the hair is cut close and the face blackened, the mourning lasting until the hair has grown again.⁴² If the Indians of the Chaco are forced to a night-march, the next day they all change their names, as also if one of their kin dies or they dream of one of the departed; this is with the object of leading the ghost astray and preventing another visit from him.⁴³ There was a more or less prevalent custom among Guiana Indians of bewailing the dead the first thing in the morning, as a matter of daily routine. Such daily lamentation of the dead is not unknown in other parts of South

America. In other cases, lamentation was limited to the period intervening between death and final mortuary festivities, the varying expressions of sorrow depending upon the kinship and friendly relationship of the survivors. One of the most characteristic of the signs of mourning, in this region as elsewhere, is the renunciation of all ornaments and the cutting of the hair. When death removes any of their blood-relations, the Arawak women drop their knick-knacks and for a short while go about quite naked. The coloration of the body in varying degrees according to the kinship of the mourner was customary among certain of the tribes, red being employed for the purpose by some, blue or black by others.⁴⁴

To "cut the hair and shed tears" were the ordinary tokens of mourning among the Homeric Greeks.⁴⁵ The prophets of Israel opposed the more violent expressions of mourning, but in vain; the shrieking of the professional mourners, the destruction of the whole domestic establishment, the tearing of clothes, blackening of walls, destruction of house-utensils, and also the blackening of the faces and the cutting of beards, went on.⁴⁶ In old Arabia the widow withdrew into the tent, put on her worst clothing, and touched no perfume for a year.⁴⁷ The ancient Arabians are said also to have cut off the hair, not so much as a sign of mourning as in homage to the deceased. When in many Greek states, through the influence of Alexander the Great, it began to be customary to shave the beard, the men took care, as they still do today, to let the beard grow long during the time of mourning. Plutarch says that whenever any misfortune occurred, whereas the Greek women cut their hair, the men let theirs grow; the former were accustomed to wear the hair long, the latter to cut it.⁴⁸ In former days when the Montenegrins shaved their heads and wore a long crown-lock only, it was customary to cut off this lock and throw it into the grave. "Women also cut off their hair. I have seen a long tress of a woman's hair fastened to the wooden cross on a grave in the Herzegovina." Self-mutilation has been and still is a mourning-custom with these people. "Face-tearing is now prohibited by law in Montenegro at funerals, but is still done in out-of-the-way places. I have seen a case." In default of a body to mourn over, a dummy is made. "Coat, waistcoat, knickerbockers, white gaiters and leathern sandals are laid out on the table in the semblance of a man and girded with the sash and weapons. A cap is laid where the head should be. I have seen this more than once. The forlorn emptiness of the man's actual clothes give an almost more poignant idea of loss than the actual corpse. . . . The tears streamed from them. They threw themselves on the dummy body, almost fighting to kiss it. Behind the table were the aged mother supported by her two married daughters. The younger, a most beautiful woman, had ripped her face down with her nails and, sodden with blood and tears, was, with her mother and sister, singing the praises of the dead boy. . . . The three women behind the table sang incessantly in a kind of awful possession, apparently unconscious of all that went on." There is here a certain pose and something of the nature of professional mourning: "The odd part of this is the mechanical way in which tears are caused" to flow. At a certain young man's funeral, the men "mostly did not know the poor boy's name and had to be coached in the details before beginning to wail, but within a minute or two of beginning they were sobbing

bitterly. Coming home people compared notes as to who had cried best."⁴⁹ In Albania the neighbors as well as the kinswomen take part in singing the funeral dirge. "These dirges are fixed by usage, but it sometimes happens that one of the mourners is inspired by her grief to utter a lament of her own."⁵⁰ To a desire to deceive the dead man, Frazer⁵¹ refers "the curious custom among the Bohemians of putting on masks and behaving in a strange way as they returned from a burial. They hoped, in fact, so to disguise themselves that the dead man might not know and therefore might not follow them." The king of France never wore black for mourning, not even for his father, but scarlet or violet. The queen wore white, and did not leave her apartments for a whole year. Hence we often hear of a tower of the white queen, in buildings of the Middle Ages which have been inhabited by the queens in mourning. In deep mourning for a husband or father, a lady wore neither gloves, jewels, nor silk; her head was covered with a low black head-dress, with trailing streamers.⁵²

§226. Resistance.

OUR cases of resisting the ghost fall into the twofold classification of (a) maltreating the corpse, and (b) of completely destroying it. In his excellent article on "Burial Customs," Frazer¹ has said that a simple but effectual plan of resisting the ghostly peril is to nail the dead man to the coffin, or to tie his feet or his hands together, or his neck to his legs. "The Wallachians drive a long nail through the skull and lay the thorny stem of a wild rose bush on the shroud. The Californians and Damaras clinched matters by breaking his spine. The corpses of suicides and vampires had stakes run through them. Sometimes the heads of vampires are cut off, or their hearts torn out and hacked in pieces, and their bodies burned, or boiling water and vinegar are poured on their graves." These and additional practices will be illustrated in the following survey.

In Kurdistan if the rain is delayed the Kurds go to the Jewish cemetery, exhume the recently dead, cut their heads off, and throw them into the river.² The ancient Chinese way of burying the dead was "in the house, under brambles and wood over which came a layer of clay;" DeGroot³ thinks this may explain why, "as the ancient tradition asserts, coffins or vaults of earthenware came into vogue even before coffins and vaults of wood were generally used." Among various peoples the corpse is placed in the grave in the sitting position; there are different reasons for this practice; among the polar people it may simply be that the living are accustomed to this posture.⁴ Among the Maoris, common people were tied tightly in a rough mat and placed in a sitting posture;⁵ here the idea of resistance seems to be implied.

The Hudson Bay Eskimo lash the limbs of the corpse to the body;⁶ those of Bering Strait pour out for the ghost a drink the evil taste of which will drive him away.⁷ The Kwakiutl mother will kick her dead child four times; "and when she first kicks him, she says, 'Don't turn your head back to me.' Then she turns around, and again she kicks him. And as she kicks him, she says, 'Don't

come back again.' Then she turns around again. She kicks him; and she says as she kicks him, 'Just go straight ahead.' And then she kicks him again, and says, 'Only protect me and your father from sickness.'⁸ The Sioux sometimes strapped the body to a stake in a sitting position and then carefully covered it with clay.⁹ In the Dakota district "very often the skeletons were 'bundled,' that is to say, the bones were dislocated and formed into a bundle, the skull being placed on the top or at the end. Sometimes they were folded as completely as possible by drawing up the knees to the chin."¹⁰ After torturing a captive, the Indians "leave him on the frame, and in the evening run from cabin to cabin, and strike with small twigs their furniture, the walls and roofs of their cabins, to prevent his spirit from remaining there to take vengeance for the evils committed on his body."¹¹ The tomahawk was used to drive off the evil spirit.¹² Tearing out the eyes was found among the Kokopas.¹³ The Macusi shaman spat upon the face of the dead and stuffed hair into ears and mouth.¹⁴ Other South American Indians sealed up the eyes, nose, and mouth of the dead, that his spirit might not cause anybody's death.¹⁵ In contrast with the cases of maltreatment of the body, some Guiana Indians bury their dead in a standing position, assigning as a reason that although the deceased is in appearance dead, his soul is still alive. "Therefore, to maintain by an outward sign this belief in immortality, some of them bury their dead erect, which they say represents life, whereas lying down represents death. Others bury their dead in a sitting posture, assigning the same reason."¹⁶

Assurbanipal is said to have mutilated the corpse of a defeated enemy in order to do him harm in the other world.¹⁷ Similar instances occurred among the ancient Greeks, though one Spartan king indignantly refused to repay on the corpse of his enemy the insults perpetrated by Xerxes on the corpse of Leonidas at Thermopylæ.¹⁸ "In West Prussia a method of preventing a dead member of a family from inflicting disease on the living is to open the coffin and cut off the head. It is further a well-known prehistoric burial-custom."¹⁹ In the *Saga of Grettir the Strong*²⁰ a revenant is decapitated, the notion being that a ghost can be laid by cutting off the head of the deceased and putting it by his thigh. Among the early people of England and Scotland there was a practice of burying a murderer or the doer of some dreadful deed by some lonely roadside and, above all, of driving a stake through his breast. This was done because their spirits were supposed to wander unless prevented; and as they needed the shadow of their bodies for that purpose, it was intended that the bodies should be so fastened as not to escape. Other means were employed for the same purpose; for instance, the head was sometimes severed from the body and placed between the legs or between the arm and side.²¹ A survival is reported in which a person is alleged to have tampered with the grave of a relative with the intention of severing the head from the body and placing it at the foot of the coffin, in order by such action to put an end to a long

series of deaths in the family supposed to have been caused by the spirit of the deceased.²²

Complete destruction of the body, which is the most effective way of resisting the ghost, though it may be performed for other motives, is usually accomplished by cremation or by throwing the corpse to dogs or vultures. The Tasmanian method of treating the dead, according to one account, probably falls under this head. "When a death occurs in a tribe, they place the body upright in a hollow tree, and (having no fixed habitations) pursue their avocations. When some time has passed, say a year or upwards, they return to the place and burn the body, with the exception of the skull; this they carry with them, until they chance (for I do not think they lose much time in seeking it) to fall in with a cemetery, in which a number of skulls are heaped together, when they add the one with them to the number, and cover them up with bark, leaves, etc. They do not bury them in the ground." This practice is not propitiatory, for the writer has never been able to ascertain that they put either weapons or food in the tree with the dead.²³

In former times, among the Tati Bushmen, when death came to an encampment, the corpses of both men and women were dragged into the neighboring bush and there left to be devoured by the hyenas and vultures. "Sometimes they were placed in the clefts of rocks and the aperture closed up with stones and branches, or put in a hole in the ground," but "this was the case if the deceased had been a person of some importance."²⁴ The only way to put a stop to the malevolent actions of an evil spirit, think the Bakoko of the Cameroons, is to dig up the corpse and burn it.²⁵ A similar method of laying the ghost is to be found among the Wawanga of East Africa, where "if a man fall sick, and in delirium call out the name of a departed relative, the sickness is usually attributed to his spirit, and the medicine-man will tell them to dig up the corpse, that the sick man may be cured. Accordingly the bones are dug up and burnt in an open place over a red ants' nest. The ashes are then swept up into a basket and thrown into a big river." Sometimes, instead of disposing of the corpse in this manner, a stake is driven into the head of the grave and into the hole thus formed boiling water is poured.²⁶ To put a stop to the sleep-disturbing visits of deceased relatives, some tribes will open up the grave, take out the corpse and burn it, and then carefully reinter the ashes. "This procedure lays the ghost." Among another group in this section, "if a man comes to steal cattle by night and is killed during the attempt, next day they build a pile of firewood and cremate the corpse. Otherwise, his ghost or spirit will trouble the village and bring sickness to it." Again, "if a child dies and the mother does not bear again, the bones of the infant are dug up, wrapped in banana leaves, and thrown into the bush; it would appear that the spirit of the child is believed to be exercising a baneful influence on the mother and the digging up of the bones is thought to extinguish the spirit. Probably it is considered that, in the case of a child, such a drastic measure as cremation is not necessary."²⁷

It occurs commonly in Mongolia that the dead are thrown out for the dogs to eat. Some natives think that the more eagerly the dogs devour the corpse the more righteous was the deceased. The animals are so used to the practice

that they take their places in readiness when the time comes.²⁸ Andrews,²⁹ leader of the third Asiatic expedition of the American Museum of Natural History, who witnessed this method of disposing of human remains, states that the Mongol dogs are the fiercest of brutes: "When persons are about to die, the Mongols believe that evil spirits enter the body. Once death has occurred, the bodies are placed on carts and driven over the roughest possible ground. During the journey the body is thrown off, to be devoured by the following wild dogs. I have seen a pack of dogs completely devour a dead body within eight minutes." In Tibet the bodies are cut to pieces by a corpse-cutter and fed to the dogs, this being called the "terrestrial burial"; then the bones are crushed in a mortar, mixed with barley, made into balls, and fed to dogs and vultures, this being the "celestial burial." Both methods are considered highly desirable. The poor are thrown into streams.³⁰ Sometimes the crushed bones are scattered to all quarters, "so that every morsel is carried away, and nothing remains in the open plains."³¹ The practice is explained by Cunningham³² as due to lack of fuel to burn the bodies. In one tribe of the Indian Hills the richer cremate, the poorer bury or fling into the water; in another, they cremate, bury, or scorch the corpse and throw it into the water; in a third, they cremate, bury, fling into the water, or expose in the jungle. "Even among orthodox Hindus, the three methods are adopted; babies they bury; from babyhood till marriage or initiation they use water burial; adults they cremate."³³ The so-called "Towers of Silence" of the Parsees in India represent an elaborate apparatus of exposure. They are heavy stone cylinders twelve to fourteen feet high and at least forty in diameter with seventy-two compartments radiating like spokes from a central well. Around the top is a living coping of vultures, perched side by side, heads pointing inward. "The vultures do their work much more effectually than millions of insects would do, if the bodies were left in the ground; and by their rapid destruction putrefaction is entirely prevented." The dry bones are swept down the central well.³⁴ Similar exposure is practised by the Buddhistic Siamese.³⁵ If a Palaung chief should die at a great age, his body is burned instead of being buried; the ceremony is the same as that of the burning of a Buddhist monk in Burma; Palaung monks are cremated in the same way. Destruction of the body for the purpose of laying a malicious ghost occurs here. A story in illustration is told of an old woman who died of fever. "After her death one person after another died in rapid succession. The tenth dying person was asked, 'Who art thou?' and the answer was 'I am X,' naming the old woman who had died. The *kar-bu* [spirit or ghost] of the old woman had made its home in her body in the grave, and coming out at night it drove the *kar-bu* out of one person after another, really killing them. . . . Her body looked as if she were sleeping. They carried it to the jungle and cut it into small pieces, burying the pieces here and there."³⁶

In Borneo, cremation seems to be confined to the Land Dyaks; "the body, being surrounded and covered with wood, is altogether consumed by the flames;" it is ominous of further deaths if the smoke rise at a slant.³⁷ On

Easter Island, "slain warriors of high rank who fell into the enemy's hands in war, they dishonored by burning their skulls, as if to burn the soul along with them, and thus create the most evil condition the native can imagine."³⁸

The Central Eskimo bury their dead, but "they do not heed the opening of the graves by dogs or wolves and the devouring of the bodies, and do not attempt to recover them when the graves are invaded by animals."³⁹ The American customs of handling corpses, including cremation, have the object of freeing the soul to find peace in the after-life.⁴⁰ The Tsimshian burned the bodies of all except the shamans. "Before the burning occurs, the heart is taken out and buried. It is believed that if it were burned, all relatives of the deceased would die."⁴¹ The same custom was observed by the Tlinkit and Haida; of the former it is stated, with reference to the usage of never cremating the shamans, that "their bodies have never been burnt for the reason that it is a common superstition that fire will not touch them." Shamans, furthermore, were never buried in family grave-houses, like others who were not cremated, and were not confined like others; "they were put, without coffin, in small grave houses, alone, situated in isolation at some lonely headland or such, which spot was often chosen by themselves before death." Cremation used to be a universal practice among the Carriers, without which one might not enter the spirit-world. "The spirits guarding the entrance there reject a ghost from earth because 'He does not smell of smoke.'"⁴² The name Carriers is derived from a custom of this Athapaskan group which requires the widow to remain upon the funeral-pyre of her husband till the flames reach her own body, when she must collect the ashes of the dead, place them in a basket, and carry them with her during three years of servitude in the family of her deceased husband; at the end of that time a feast is held, after which she is released from thralldom and permitted to remarry if she desires.⁴³ It is proved beyond a doubt by numerous instances that cremation was practised in certain cases by the Mound Builders.⁴⁴ In Georgia human remains, sometimes cremated and sometimes not, were laid on the sand with vessels of earthenware inverted above them.⁴⁵ Cremation was practised in some cases where persons died of unknown diseases. In the case of a Kutchin chief, the body was burned by men employed for the purpose, and the burned bones and ashes put in a wooden receptacle and hung in a tree. "The men who burned the body ate no fresh meat for a year, else, it was believed, they too would die."⁴⁶ Like the tribes of the northwest coast, the Indians of Guiana cremated the bodies of all except the medicine-men.⁴⁷

Cremation is said to have been a regular practice during the later Bronze Age.⁴⁸ The old Norse graves which remain were probably those of the better class. So many skeletons, piled up in graves from floor to capping-stone, have been found that all the flesh must have been removed by action of air or otherwise before interment; here may be a case of "second burial."⁴⁹ Odin is said to have ordered that the dead should be burned.⁵⁰

§227. Expulsion.

Among the means to which recourse is taken against the lingering ghost are fire, water, noise, and a show of force. In British New Guinea, where ghosts are known to walk about, even the police at times want to fire off their rifles to frighten them away.¹ When some Europeans made an excursion to a cave of the dead in Eddystone, Solomon Islands, the native guide threw stones ahead of him to frighten away the spirits, else the members of the party would fall ill, and on coming out they were given dark leaves to prevent sickness and were instructed not to look back. A Fijian will use an axe on any object which he thinks harbors a ghost.² In the Trobriands, after two or four weeks the return of the ghosts to the other world is compulsory, being induced by the ceremonial hunting-away of the spirits. The drums intone a peculiar beat which the spirits know; when they hear it they prepare for their return-journey.³ To frighten away the spirits which attend every feast in D'Entrecasteaux, an old man comes forth and brandishes his spear toward every point of the compass; then the men seize their spears and the women sticks and stones, and hammer on all the houses. "A native dreads being overtaken in the woods by darkness lest he should encounter a spirit, and his fire is often as much for protection against them as for warmth. No attempt is made to propitiate them; they are enemies of the human race, and cannot be conceived of as ever doing good." The power of these ghosts or spirits is as unlimited as the people's imagination.⁴

During the funeral-rites in Mashonaland the natives chew and spit out a poisonous root, which is probably an exorcistic practice.⁵ Among the Edo-speaking peoples, water is thrown on the roof as the child is carried in, and it must drip upon the child—water being a protective device against ghostly influence; while at an Ibo burial the husband sits in a special part of the house and mourns, with a fly whisk and a matchet near him, and "when his dead wife comes to kill him she sees the matchet and goes away."⁶ Weeks⁷ mentions an incident from the Upper Congo which recalls Tam O'Shanter: "There had been a death in the family, and the relatives had just performed all the necessary rites and ceremonies, and were returning to their homes. A small trench some twenty feet long was dug with a hoe. The relatives took up their position on the side of the trench nearest to the grave, the *nganga* [shaman] stood on the other side, and his assistant was placed at the end of the trench with a large calabash of water. At a signal the water was poured into the trench, and while it was running the *nganga* took each person by the hand, and mumbling an incantation, pulled him or her over the running water. When all had been pulled over one by one the water was allowed to run until the calabash was empty. I asked the reason of the ceremony, and they told me it was to keep the spirit of their buried relative from following them." An exceptional interpretation is given by this author to the funeral-practice of firing guns, shouting, wailing, and beating drums: "Such noises are heard in *longa* [other world] and give warning of the approach of another soul. The

louder the noise the greater is the anticipation of those in *longa* of seeing a great man arrive." The common object for making noise on such an occasion is to drive away the spirit, and it may well be that we have here a case of naïve rationalization.

In Madagascar during a heavy rain, the people beat the walls of their houses violently, to drive out the ghosts who may have tried to escape the rain.⁸ Evil-disposed ghosts must be expelled because they cause sickness and other calamities; if they cannot be appeased, among the Baganda, a shaman is called who catches the ghost by thrusting into the roof a stick tipped with a horn. He then lowers the horn, covers it with bark, and plunges it into a pot of water, finally throwing it into a river or upon unreclaimed land.⁹ Rumbling noises and abdominal pains are regarded by the Bahima as signs of possession by spirits. There are times when these evil spirits are especially likely to possess one and at such times means must be used to drive them away; for instance, when women are obliged to expose the body, "they take a small gourd with a longish neck in which is a mixture of tobacco and water, the water is then poured through a small hole in the gourd's neck over the parts to prevent evil spirits from entering the person whilst thus exposed."¹⁰ After the East African burial all present proceed to the river to bathe; until they have done so they may not enter any hut but that of the deceased. "On their return a fire is lit on the grave over the feet. This fire is kept burning for one whole month. Should it go out, it must be re-lit from the fire in the hut; should this also be extinct, it must be lit again by means of a fire drill."¹¹ Such a fire, maintained by the most ancient methods, is especially effective in keeping away the spirit of the deceased. To dream of dead people in the estimation of the Kikuyu is highly undesirable; "the dreamer takes live charcoal in his hands next day and rubs it between his palms saying, 'I shall not dream of that dead man again.'"¹² After a dream the Hausa spit first to the front, then to the right, left, and back; "this averts evil in all directions."¹³

In Siberia the ghost is given forty days "law"; after which, if he still hangs about, the shaman hunts him out and drums him down to hell. To prevent any possible mistake, he personally conducts the lost soul to the lower regions and treats the devils all around to brandy.¹⁴ It is necessary to be protected against evil influence on an occasion such as marriage: among the Yukaghir, "some relative in the wedding party fires a gun to protect the bride from the attacks of evil spirits; this is called 'shooting into the eyes of the evil spirits.'"¹⁵ The inhabitants of the Altai Mountains think they can drive the ghost into the underworld most effectively by the use of water.¹⁶ In South India the dying man is given a bath and drinks holy water in which the priest's feet have been washed.¹⁷ The Saoras pour water on the body while it is in the house.¹⁸ People who die a violent death or perish by accident or of poison, cholera, smallpox, or leprosy are thrown into water and after some months cremated in effigy.¹⁹ The holy water of the Ganges is used for death-purification.²⁰ Among the Parsees water is used along with cow's urine in funeral-

purification. On the dawn after the third night, the soul goes to the other world, passing by way of a bridge.²¹ During the process of cremation among the Nairs there is a ceremony called literally "to walk round a pot," which consists, as its name implies, in walking round the pyre with a pitcher, the bottom of which is pierced. One of the family fills this pitcher with water and carries it three times round the burning corpse, dashing it on the ground at the end.²² Elsewhere in India, ten days after a death the potter makes small images of flour and water and places them in flowing water.²³ Among the Nagas the evil attaching to the manner of death and the prohibitions entailed can be avoided if before he expires the unfortunate can be caused to consume food or drink. It is enough to pour a little water into the mouth of the dying or even to spit into it.²⁴ At the funeral of a male Toda occurs a ceremony similar to that of the Nairs. A man of the same clan as the deceased goes round the burial-place three times ringing a bell, while another accompanies him, holding him by the waist. "The man who rings the bell then takes a new pot, ordinarily used for carrying water, and, raising it over his head, brings it down and breaks it on the stone covering the ashes. He bows down and touches the stone with his forehead, gets up, and goes away to the funeral hut without looking back."²⁵ Force also may be used, for "immediately a Rangte has breathed his last all present seize weapons and slash the walls, floor, and roof of the house shouting, 'You have killed him, whoever you may be we will cut you in pieces.'"²⁶

An instance of imitative repulsion is the following: when the mischievous ghost of a person killed by a tiger is supposed to haunt its old home, a man belonging to a different family is made to assume the shape of a tiger, being provided with a tail and painted to resemble the striped appearance of the beast. Thus disguised, he is caused to walk on all fours like a quadruped, and is led by two men with strings tied to his hands and legs. The priest recites his *mantrams*, or spells, and makes a show of chasing away this sham tiger; meanwhile the evil spirit of the person killed is believed to take its flight. In general, water and fire are, like sacrificial blood, beneficent elements by the aid of which the mischievous influences of many an evil power may be neutralized. We have already seen that people who have touched a corpse may get rid of the evil influences of such contact by bathing; and the same may be accomplished by fire-lustration or fumigation. Sometimes an entire village is purified in a ceremony in which the head of the whole body of villagers traverses the village from one end to the other, ceremonially sprinkling water from a pumpkin-gourd on every suspicious-looking nook and corner and every bend and turn on his way. Water-lustration is employed by some natives on other occasions than death; purification by ablutions in cold water is required in the case of women who have attended a delivery, in the case of a priest or other person who has to offer sacrifices or make other offerings to a deity or spirit, and in the case of a bride and a bridegroom just before the wedding-ceremony. "Such ablutions are believed to remove all supernatural evil influences. Even the ceremonies of washing the feet of guests . . . and of members of the family on their return home from a distant place, though these may appear to us as only delightful exhibitions of Oraon and Munda hospitality and domestic

affection, may not improbably have originated in the supposed efficacy of water in removing all possible supernatural evil influences of the strange places and strange roads."²⁷

In China, "the doctrine that a dying person must give up the ghost on a water-bed is, now-a-days, far from obtaining as a peremptory customary law."²⁸ In the south of China one of the soul's trials in the nether world is the crossing of the yellow river. For this the priest makes a little ship of bamboo-leaves which he floats in a cup of water. With constantly intensified prayers, interrupted only by the tinkling of bells and the beating of drums, the priests run around the cup. At last they announce that by the power of their prayers the soul has successfully crossed the river.²⁹ The Chinese are also said to knock on the floor with a hammer, to chase away the lingering ghost, while the Northern Burmese dance the ghost out of the house, accelerating his departure by a liberal application of the stick. Among the Battas in Sumatra the priest, aided by female mourners, acts as ghost-sweeper.³⁰ Among the Palaungs, "when the labour pains begin, the woman sends for the friends who have arranged to be with her. They bring with them water, over which incantations have been recited, and sprinkle it in and round the house in order to keep evil spirits at a distance. They then go to the inner room where a good fire has been made."³¹ From the Malay States is reported an instance in which a group, thinking that a ghost had stricken down two or three of their kinsmen in rapid succession, moved their settlement to the other side of the river, in the expectation that the ghost would not be able to follow them across the water.³² Among a number of tribes in the Malay Peninsula, the children immediately after birth are carried to the nearest rivulet, washed, and brought back to the house; then a fire is kindled, incense thrown upon it, and the child passed over it several times. "We know from history that the practice of passing children over fire was in all times much practised among heathen nations; and that it is still practised in China and other places."³³

In the Indian Archipelago, to take a bath or wash the hands and feet had a significance almost wholly lost to us. The original import of these acts must have been to place a physical barrier between the living and the dead. The first barrier so conceived was probably a river, which the dead must cross to get to the other world. To the Borneans the way to the spirit-world is over big trees as bridges and over paths as sharp as swords. If the soul falls off the bridge the fish eat and thus annihilate it.³⁴ Elsewhere the soul "has to go past burning water-falls, to cross a great many rivers and lakes, go through the abode of the criminals and climb over high bridges before it reaches the banks of the river "on which are the golden dwellings of its deceased ancestors."³⁵ The Timor-laut spirit-world is a certain island upon which no one dares land and by which they sail with fear and great vigilance.³⁶ Later, thinks Wilken,³⁷ out of this crossing of water arose the custom of prophylactic bathing, while still later the whole was reduced to the washing of hands or the sprinkling of water. Given such views, it is quite rational that as one deliberately steps through water on the way back from a burial, so, in the

opposite case, on going to a burial, one is careful to avoid water, as otherwise the soul might remain back in the village. This is actually the case with the Macassars and Buginese who, on the occasion of a burial, go out of their way so as to avoid as far as possible the passing of streams. Water-purification after touching the dead is common in the Archipelago, and in southeast Borneo is performed in a curious way: the entire family of the deceased get on board a small craft which is taken out into the middle of a river where it is capsized by a priestess, so that all fall into the water; "this ceremony is repeated three times and secures purification from contact with everything that belonged to the dead." The use of water in a less direct way is practised by the Sea Dyaks who break a jug of water on the floor the moment the corpse is carried out of the dwelling. Among the Mohammedans of the Indian Archipelago the custom prevails of sprinkling the grave immediately after the burial with water brought from the death-house. Washing the hands after a funeral is general. The Nuforese, surrounding the grave, take a blade of grass or leaf which they form in the shape of a spoon and bring several times into contact with the head as if pouring something out; in other words, they imitate the action of bathing while they murmur, "The ghost comes." Thereby they adjure the deceased not to come "spooking" around the relatives. Another device for expelling the ghosts mentioned by Wilken is the burning of salt in the house of the deceased, with the thought that the crackling so produced operates to keep the ghosts at a safe and proper distance. The practice protects not only against each ghostly visitation, but also keeps the souls of the deceased from entering the dwelling. There are still other methods of scaring away the ghosts: the spirit of a woman who has missed the joy of motherhood by dying during pregnancy is supposed to be especially averse to nudity; hence the widower, wholly naked or wearing a mere apron, climbs to the roof of his house, fully armed, and supported by armed friends round about and under the pile-supported house. "All begin to hack and stab in the air with mad rage, and thereby, according to their belief, the ghost is frightened and withdraws."³⁸ In Central Borneo it is thought that nudity scares the evil spirits and "that display of the private parts, or even an image of them, is especially effective."³⁹ Hurling lances at the coffin is another method,⁴⁰ while the Dusuns have a ceremony called "brushing," which they perform in order to rid the house of the spirits of disease; the men brush down all the walls of the house with bunches of flowers and bamboo-leaves, thereby, at least figuratively, brushing away the evil sprites.⁴¹

It was taught among the Maoris of old that "water is the life of all things; without water nothing could flourish." There are a number of ceremonies in which water is an essential element, but the most elaborate appears to be the baptism of the child. Two priests prepare for their part in the performance, which consists for the most part in taking off all their garments and donning a scanty apron. The chief priest takes his stand in the water, which is the "cleanest" to be found, immersed in which, in Maori eyes, he stands the least chance of being affected by polluting influences. He is, as it were, spiritually insulated for the time being. As he concludes a certain ritual, he dips a little water up in his right hand and sprinkles it over the parents as they stand at the edge of the water. The secondary priest hands him the infant's umbilical cord

41 Evans, in JAI, XLVII, 153.

which he slips into the water. The child is then submerged up to his neck and the priest sprinkles some water on his head. This is but a skeleton of the ceremony. When the Maori first saw the European method of baptizing children, they did not approve of it; the general remark was that it was not correctly done, for it did not follow ancient custom; that nature's own font was the only proper place to perform such a ceremony; that as performed by white folks it was much less *tapu*.⁴² The Maoris also have their river Styx. They are known to thrash the corpse in order to hasten the soul's departure.⁴³ In the Gilbert Islands, on the three nights following a death, the ceremony of *bo-maki* was performed. "All the people, irrespective of their kinship to the deceased, gathered together in the darkness, with sticks of pandanus wood and the butt ends of coco-nut leaves in their hands, at the southern extremity of the village, and, forming a line abreast from east to west, slowly advanced northwards, beating the ground and trees before them with their staves. Not a word was uttered. When the line had swept through the settlement from south to north it stopped, and the participants disbanded in silence. All pedestrians who happened upon the party while it was at work would seize a staff without a word, join in, and when it was finished pass on their way. The object of the ceremony was to encourage the soul of the dead to leave the neighbourhood of the body and also to drive away any evil spirit that might wish to possess it."⁴⁴

In Alaska, "from the moment of death until the body is disposed of, some one must remain with the corpse day and night and a light must burn every night. This is to guard against the intrusion of spirits. The Greek church custom of burning candles about the dead appeals strongly to this phase of their superstition and conforms to their practice."⁴⁵ At night, when the common people of the Quileute Indians of the Northwest Coast begin to feel creepy, in the belief that ghosts may be coming, "they shoot off their guns and make other noises, in the conviction that this will keep the ghosts away from their households."⁴⁶ Among the Omaha, a fire was kept burning on the grave for four nights, the reason given being "that its light might cheer the dead as he traveled; after that time he was supposed to have reached his journey's end." Many tales are told concerning ghosts, with advice as to how to escape them. "Ghosts bent on mischief, as tampering with food after it was prepared for eating, could be thwarted by placing a knife across the open vessel containing the food. A ghost would not meddle with a knife. Nor would ghosts ever cross a stream; so, if a person was followed or chased by a ghost, he would make for a stream, wade it, or even jump across it. No matter how small the stream, it made an impassable barrier between himself and his ghostly pursuer."⁴⁷ The Algonquins beat the walls of the death-chamber with sticks, while in ancient Mexico professional men were employed to search the house until they found the lurking ghost of the late proprietor, which they summarily ejected.⁴⁸ The Aztec priest sprinkled water on the dead man's head.⁴⁹ The mourners at the Makusi burial jump over the fire.⁵⁰

The great mystery-feast of the Jibaro Indians is that celebrated by a

warrior who has captured a head. Its aim is to purify the slayer from the blood attached to him after the killing of an enemy and to protect him against the spirit of the latter, who is thirsting for revenge. Both water and blood act as purifying agents. A little water is put upon the head of the slayer and then upon his wife and daughter who, by touching the still blood-stained hands and clothes of the slayer, have likewise been polluted with the blood of the murdered enemy and consequently are exposed to danger from the revengeful spirit. All three are subsequently sent down to the river to bathe. Purification is effected also by applying blood, which must of necessity be that of a chicken, to the legs of the slayer. The lance with which the enemy has been killed is looked upon with superstitious fear and the warrior is therefore anxious to exchange it as soon as possible. Tobacco-juice is given through the nose by the priest to the victor, and to his wife and daughter through the mouth. After the feast the Jibaro warrior retires to the forest, where he stays alone, taking tobacco-water, bathing every day in the waterfall, and sleeping at night in a small "dreaming hut." As soon as the black paint he has put on his body has disappeared he returns home, where he finally drinks some narcotic in order to see whether there are still enemies threatening him and whether everything will turn out happily for him in the future. This case is especially significant in that it clearly brings out the need of purification of the slayer; his case is like that of those who come into contact with a corpse. There is also in evidence here a number of expulsion-devices, many of them childish and naïve, by which the Indians fancy that they can keep the feared spirit at bay. In general they are the same as those resorted to for repelling a living human enemy. At one stage of the ceremony, for instance, three warriors rush into the house brandishing their weapons and shooting, thus trying to keep off the invisible enemy and inspire him with terror, for "the lance and the shield, and still more shots from firearms, are feared even by the spirits." Furthermore, "the measure to keep the trophy [head] tied to the murderous weapon, the 'demoniacal' chonta lance, the rattling with the shields at the most important ceremonies, the attempts to inspire the spirit with fear by making noise, by threatening movements and dancing, and to 'wash off' its malignity and desire for revenge by washing the head in a magical solution, all illustrate, in different ways, the primitive conception that the Jibaros have about the supernatural beings and the possibility of influencing them."⁵¹

The water-barrier between the living and the dead often dwindled into a mere stunted survival, especially among more advanced peoples. Thus, after a Roman funeral it was enough to carry water three times round the persons engaged and to sprinkle them. Modern Jews, as they leave the graveyard, wash their hands in a can of water placed at the gate; before they have done so they may not touch anything nor may they return to their houses. In modern Greece, Cappadocia, and Crete, persons returning from a funeral wash their hands.⁵² Another Jewish practice is mentioned where a relative of the deceased goes to the toilet-table and turns the looking-glass to the wall, being afraid of seeing the ghost in the glass, and opens the window to empty the jug of water upon the sunlit grass.⁵³ At the Roman feast of the *larvæ* and

lemures all intercourse ceased, the temple was closed, the hearth-fire and the sacrificial blaze were extinguished, the hands were washed repeatedly, black beans were strewn for expiation, and bronze cymbals were beaten together, all for the purpose of banishing the ghosts.⁵⁴ In Babylonian literature may be found means of exorcism which are directed explicitly against the wandering ghost of the dead as the cause of sickness.⁵⁵ The Germans waved towels about or swept the ghost out with a besom, after the Roman custom by which an heir swept out the ghost of his predecessor with a special broom. In Scotland and Germany, when the coffin was lifted up the chairs on which it had rested were carefully turned upside-down, lest the ghost should be sitting on them. In modern Greece when the corpse is once out of doors, the whole house is scourged.⁵⁶ These are a few survivals of the many practices for driving away evil spirits or laying ghosts.⁵⁷

§229. Human Sacrifice.

In the cases which follow, human sacrifice is practised chiefly for the purpose of providing the deceased with a grave-escort, this being especially the case where wives and slaves are the victims. In some of the instances the cannibalistic motive is present. Common to all is the literal conception of life in the other world as a replica of life on earth.

Custom prescribes in the South Sea Islands that, should their husbands die before them, wives must submit to be strangled and put into the same grave; "this they do with the greatest alacrity, and should the man have ten wives at his death, all must suffer and be buried with him."¹ Occasionally among the Upper Congo natives male slaves are killed and sent with messages to the deceased head of the family. "Such a slave generally requested that the headman should remove his anger from his family and allow them to enjoy health and prosperity. It was after much sickness and many misfortunes in a family that such a messenger was sent. Only wealthy families could afford such a luxury as this, and the whole affair would be talked about all over the district and the family be greatly respected for this proof of their wealth." Failing in fisherman's luck was one of the unfortunate occasions requiring a sacrifice; "it was no uncommon thing, when a village was unsuccessful in its fishing, for the inhabitants to join their brass rods [local currency] together to buy an old man or old woman—old by preference, because cheap, and throw him (or her) into the river to appease these water spirits." In the old days it was also customary at a funeral to kill two slaves, putting one under the head of the dead as a pillow and the other under the feet. In every family of importance there was a slave wife, who went by a name which indicated that she was to be buried alive with her dead husband. "The number of wives buried in the grave was in proportion to the man's wealth and importance, but he always made certain of one." Further assurance of attendance was obtained by putting the skulls of enemies at the base of palm-trees and using them as foot-stools, the desire being to insult the fallen foe by these indignities and to have some hold on the spirits of those slain in war, that they might attend their conqueror

in the spirit-land.² In East Central Africa the Ba-Mbala sacrifice a goat, half of which is buried with the corpse and the rest eaten; in former times it seems probable that the victim was a slave.³ Again, as soon as a king had breathed his last, two of his wives were instantly sacrificed. "On the burial day, when the body of the chief, now reduced to a skeleton, was laid to rest wrapped in a bull's hide, all his servants, councillors, and his wives were paraded before the tomb, and smitten between the eyes with a club. They were then left for dead at the tomb, and if by chance anyone managed to survive, he was not seized again, as the *Basinganga* [medicine-men] who preside at these functions say that he is not acceptable to the dead chief's spirit." When a Wabisa chief died, instead of sacrificing all his attendants, his people only killed his head-wife, and this when the chief had lain for a long time in state and only his bones were left. "Her body was split in twain, and the bones of the chief were put inside, and buried in this ghastly winding sheet."⁴ Formerly, among the Nigerian head-hunters, "if the deceased had been an important person, people were killed on the day of the funeral so that their ghosts might accompany his, and their skulls were left on the grave until the flesh was gone, and then added to the other trophies of the family." Today, if the deceased has been an important person or a parent, a goat is killed; if unimportant, a fowl; if a baby, nothing. The flesh of the goat or fowl is then divided amongst all the relatives present, who are always summoned; to forget them would be a deadly insult. "Meat is a message which must not be ignored."⁵

When the Ostyak were at war with the Samoyed, and afterwards with the Tartars and Russians, not only did they vie with the Samoyed in the custom of scalping a slain enemy, but some of their songs tell also of heroes eating the hearts of the foes they had killed.⁶ On the day of the return from the war-path of the head-hunting Sema Nagas, the successful raiders must celebrate a certain ceremony, for until it is done they are unclean, taboo, holy, and a village that is sowing and tilling may not entertain them. Some of the eastern Semas skewer wads of meat to the mouth and eyes of the dead enemy, that the ghost, eating and being filled, may call his friends to come and be killed; then all sorts of indignities both in word and deed are showered on the trophy by the women and children of the village. On the day of a burial, cattle and pigs are killed and the skulls put up on a sort of fence or rack erected for that purpose, along with the skulls of those slaughtered by the dead man during his lifetime; the souls of these victims he either takes with him to the village of the dead or finds already awaiting him there. The practice of boring the lobe of the ear, which must be done some time by all, is probably a survival of human sacrifice and an identifying tribal mark; "if a man die with the concha of his ear unbores his forebears in the next world disown him."⁷

The practice of head-hunting, which is common enough in the Indian Archipelago and among many Papuans, is clearly in the nature of a human sacrifice when accomplished on the occasion of a burial; the possession of a head is necessary, among some of these tribes, to enable them to leave off mourning. So long as one has not found opportunity to get possession of a head, "the spirit of the departed continues to haunt the house and make its presence known

by certain ghostly rappings." The Dyaks think then to mollify its anger by having the nearest relative throw a packet of rice under the house every day, for its benefit, until it is laid to rest by their being able to celebrate a head-feast; "then the Dyaks forget their dead and the ghosts forget them."⁸ Wilken⁹ thinks that the practice of shearing the head at the time of a death was originally a sacrificial act, which seems likely in these cases cited by him, for the shorn hair is deposited in the grave with the dead. In the Indian Archipelago slaves are killed in order that they may follow the deceased and attend upon him. "Before they are killed the relatives who surround them enjoin them to take great care of their master when they join him, to watch and shampoo him when he is indisposed, to be always near him, and to obey all his behests. The female relatives of the deceased then take a spear and slightly wound the victims, after which the males spear them to death." In the Philippines also, when a noble died a number of slaves were sacrificed, so that he could have the proper social setting in the spirit-world.¹⁰ In some of the more remote traditions of the Samoans reference is made to human sacrifice.¹¹

Among the Chinook and a few other tribes of American Indians slaves were buried alive that they might accompany a chief to the next world; one writer, who speaks from hearsay only, mentions the killing of women of a hostile tribe by a chief in order that their spirits might serve his dying son in the other world.¹² In addition to the usual manifestations of grief at the death of a relative or friend, some Indians cut off their hair and burned it on the grave,¹³ while in the scalp-dance there was probably some survival of former sacrificial practice.¹⁴ Self-mutilation at funerals was a regular performance among the Guiana Indians¹⁵ and in Brazil the natives cut off their fingers for the dead, a joint for each relative; some old men had only the thumb left.¹⁶

At the funeral of Patroclus, among other sacrifices, twelve young Trojans taken captive on the last day of battle were slain, their bodies laid on the outer part of the pyre, and fire applied. Shorn locks of hair were strewn on the corpse of Patroclus. In Euripides one reads of the drinking by the dead of the blood of human sacrifice, for instance, at the sacrifice of Polyxena at Achilles's tomb.¹⁷ Among the ancient Arabs the cutting of the hair partook of the nature of a sacrifice.¹⁸ There were relics of human sacrifice among the ancient Jews and Babylonians.¹⁹ Head-hunting flourished in Europe well into the middle of the nineteenth century and was not yet extinct, a few years ago, in the Balkans, where it has long been common to Christian and Moslem alike. Sacrifice of hair also prevails, and till quite recent times the pigtail was sacrificed in South Slav lands. "The rest of the head was shaven and the long lock plaited. Many of the portraits of Serbian heroes of the beginning of the nineteenth century show it, and in many parts of Bosnia it is still worn by the Roman Catholic peasants. It is usually coiled up and hidden under the head wrap, but in church, when the head is uncovered, you may see long pigtails hanging down, and giving a Chinese

appearance to the congregation. At funerals, until about 1850, it was customary for the near male relatives of a deceased man to cut off their pigtails and throw them into his grave. One great use of the pigtail, I have been told, was to carry home heads by. The South Slavs, and especially the Montenegrins, had a passion for head-taking, excelled by head-hunters in no part of the world. We have record of the taking of huge numbers, in the poems by Veliki Voyvoda Mirko, the father of the present King of Montenegro. He published a number on the wars of 1850-60. They are devoid of any literary merit, but detail exactly the methods of the head-hunters of Europe. . . . Head-cutting was not practised in the last war, but nose-cutting was substituted, noses being more portable. This disgusting practice consists in cutting off the nose right through the nasal bone, and shearing away the whole upper lip with it. The trophy is then carried by the moustache." A certain ecclesiastic in South Macedonia "brought head-taking quite up to date in 1903 by having the head photographed afterwards, and sending copies to his friends as Christmas or Easter cards—I forget which."²⁰

Modern Japan has furnished a number of illustrations of sacrifice before and after the death of the ruler, including cases that may be designated as voluntary human sacrifice. Before Emperor Mutsuhito died, in 1912, shrines over the countryside were thronged with worshippers praying for his recovery. At one shrine a young girl cut off her hair and offered it as a sacrifice; at another five men offered to the gods a prayer written on a scroll in their own blood. Devotion reached its climax in the suicide of General Nogi, following the Emperor's death. Similar scenes marked the passing of Emperor Yoshihito in December, 1926. The police were directed to exercise special precaution to keep Japanese from following General Nogi's example. All owners of firearms registered with the police were visited and requested to take care of their guns and not to lend them. That the fear was not ungrounded is evidenced by the suicide shortly afterwards of an aged man who died facing his ruler's portrait: Baron Ikeda shot himself, leaving a letter saying that he wished to follow the spirit of Emperor Yoshihito.²¹

§230. Food-Offerings.

IN British New Guinea it is thought that the dead man hovers near the grave, sees the food placed upon it, is pleased, and then goes away.¹ "A small platform is made over the grave, or sticks are stuck along the sides, and on these are placed sago, yams, bananas, coconuts, cooked crabs and fish: all for the spirit to eat. A fire is also lighted by the side of the grave, and friends keep it alive so that the spirit may not be cold at night."² Substantial tokens of affection, in the form of direct offerings of food, are supposed by the natives in the Trobriands to please the departed spirits; indeed, the offerings are prompted as much by fear, for the spirits "get angry whenever there is little display of food."³ Although the food put on graves in the New Hebrides is eaten by animals, it is thought to be pleasing to the spirits.⁴ These people worshipped the ghosts of their ancestors; "they prayed to them, over the kava-

bowl, for health and prosperity; reminding us, again, of the origin of 'healths,' 'toasts,' etc."⁵ The living, as is evident, expect something in return, even though it be but the negative withholding of calamity. Not long ago there was a big hurricane at Tikopia, in which so many coconut trees were blown down or damaged that there was a great scarcity of food. This disaster was of course caused by the spirits: "The people thought that the *atua* had sent the storm, being angry because they had not been giving enough kava, and in their turn the people were angry with the *atua*. To make matters worse there followed a drought; the sun shone continuously and dried up the earth and starvation was staring the people in the face. Offerings of kava were made daily to bring rain but without result. At last the brother of the chief of the Taumako asked John if he could do anything and John prayed for rain which fell three days later so that the taro and yams grew again. The apparent success of John led to a division among the people, some believing that the rain was due to his intervention while others believed that it had been sent by the *atua* to whom at last the long continued offerings of kava had become acceptable."⁶

A short time after a burial in Cameroons a goat is slaughtered over the grave and the blood allowed to flow down a tube which extends to the head of the corpse. Then the liver of the animal is chopped up fine, mixed with palm-oil, and dropped down the tube. Afterwards yams, dried fish, salt, and palm-wine are put down the tube and around its mouth. For these the people ask something in return: "as this was being done, the ghost of the head-chief was asked to use all his influence to make the crops produce plentifully and the women to bear children."⁷ The grave among the Batetela is marked by a small mound, on which is erected a miniature hut, where food must be deposited daily by a relative who, should he neglect this duty, will be haunted by the dead man in his dreams. "If he does not mend his ways his wife and cattle will become sterile and his crops will fail."⁸ Zulu graves are said to be decorated in a new way owing to contact with civilization: the Zulus have hit upon the device of placing on the graves of the departed the bottles of medicine prescribed by the doctor.⁹ Among the Wawanga of East Africa the expectation of a *quid pro quo* is evident: "A pot of beer is brought, and one of the dead man's brothers pours a little over the grave saying: 'Drink this beer we have brewed for you,' and the kinsmen then consume the rest of the beer. . . . A bullock is then slaughtered and its blood poured over the grave. The ears, nose, wind-pipe, tongue, lungs, stomach, liver, the right hoof and the meat under the back-bone are put in a pot, boiled and cut into small fragments; these are then tied all around the grave . . . and the souls of the departed ancestors are thus addressed: 'You are our eyes, accept this food, and keep us in good health.' 'See, brother, we have brought you this food, eat and be not angry with us and send us good health.'"¹⁰

The Todas of southern India hold a feast for the dead which in the old days was a great occasion, the proceedings lasting for two whole days and many buffaloes being slaughtered; the Government now allows but two buffaloes to be killed for each person, though if two or more funerals are held simultane-

ously there is an appearance of the olden times.¹¹ The eating of meat was once universal in India; cows were sacrificed and the flesh eaten, especially at feasts in memory and honor of the dead, where the aroma of beef was thought to be an excellent aliment for the departed. The ancient law allows all sorts of animal food to be eaten, provided that small portions are first offered to the gods and to the spirits of departed ancestors. Of all the ceremonies connected with the Hindu religion the feast of the dead is the most important, and in some cases quite equal in expense to a marriage. It takes place on the thirtieth day after the death of the person on whose behalf it is celebrated. Its main features are the feeding of large numbers of Brahmins and Hindus of other castes and the presentation of offerings of food and sweetmeats to the spirit of the person recently deceased and to his or her ancestors.¹² The Feast of the Departed in Japan lasts for seventy-two hours, from July 15 to July 17, according to the lunar calendar. The dead come back from the spirit-world to live with their families for these days, and there is great rejoicing. The home is garnished and swept, food is placed in the alcove where the altar to the dead is erected, and the entire family behaves during the three days as if all their ancestors were in the home with them. On the last day signal-fires blaze before the doors of the homes of all Japan, lanterns twinkle in the graveyards, and there is general merrymaking, for on this day the dead join with the living in feasting. When one of the emperors of Japan was buried, chests containing rice and other food were deposited in the tomb.¹³

Wilken,¹⁴ writing of conditions in the Indian Archipelago, says that the flesh of slaughtered animals, although in a few cases placed in the grave with the corpse, is for the most part eaten, and that out of this practice arise the feasts of the dead, which are nothing but sacrifices offered to the manes. In some cases the dead are thought to appear on earth to carry on a system of secret depredations upon the eatables and drinkables of the living, in other words, to come for their share. With the feast these "foraging expeditions" come to an end: the dead then are said to relinquish all claims upon the living, and to go henceforward on their way, depending upon their own resources. The feast of the dead ends the period of mourning, because then the souls, without further claims on the living, leave the earth and go to the spirit-world. The case of the Sea Dyaks is reported more fully. Among them mourning is observed until the feast in honor of the dead is held. On the third day an observance called *Pana* is made: a plate containing rice and other eatables, as well as a Dyak chopper, an axe, and a cup, is taken by several of the neighbors to the room of the dead person. "They go to tell the mourners to weep no more, and to give the dead man food. They enter the room, and one of them—generally an old man of some standing—pushes open the window with the chopper, and the offering of food is thrown out for the benefit of the dead man and his spirit companions. Up to this time the near relatives of the dead man live in strict seclusion in their room, but after it they may come out to the public part of the house and return to their usual occupations. Until this *Pana* is made, the Dyaks say the soul of the dead man is unsettled. It has not quite left this world, and Hades will not receive it or give it food and drink. But thereafter it is re-

ceived and welcomed as a regular denizen of the spirit world."¹⁵ The Sakai place food on the grave and light a fire there for six days after burial; then the ghost departs.¹⁶ The Jakun fix a bamboo in the grave in communication with the mouth of the corpse for the purpose of feeding it.¹⁷ Among the Filipinos food and other articles are placed in reach of the dead and on the fourth day, when the funeral-honors are celebrated, a place is left vacant for the deceased, the people believing that he really occupies it. Usually food is given to the dead to keep them from doing harm.¹⁸

Some time after the death and burial of a young man or woman, the Omaha parents gave a feast, inviting to it the companions of the deceased. Other similar acts of offering food, all of which partook of the character of remembrance, were practised, "none of which were done because of a belief that the dead needed or partook of the food."¹⁹ Among the Arawaks all of a man's crop of cassava was used at his death for the feasts in his honor.²⁰ The final burial-festivities, which close the period of mourning, take place among the Guiana Indians upon the anniversary of the death; song, dance, drunkenness, and venery run riot.²¹

The idea underlying the death-festivals of the Romans was that the ghosts of the dead return at times to the upper world and must be conciliated by gifts, lest they harm the living; more than half the year was given over to holidays, until Marcus Aurelius ordered that there be not over one hundred and thirty-five festival days in the year. Among them were three which were sacred to the spirits of the lower world, nine on which the graves of relatives were decorated and the ancestral ghosts were offered sacrifices, and another on which all the relatives met for a feast.²² Among the Zoroastrians, during the last ten days of the year the souls of the dead came in festive throngs to their surviving relatives; flowers, food, and wine were offered to them.²³ It has long been a Jewish custom to offer food to the dead.²⁴ According to the Aryan view, which has been preserved in all Indo-European nations, deceased persons still exist after their death as ghosts or "shades"; therefore they take with them into the grave, or upon the funeral-pyre, the things to which they were most attached; and they also need food and drink.²⁵ Most interesting in the folk-lore of the Bretons is the Feast of the Dead; as midnight approaches the watchers draw away from the fire, to make room for the spirits: "'Come!' sighed a peasant, 'we have used the fire long enough. Now let us make way for our ancestors. You know the saying, "Death is cold! and the Dead are cold!"'"²⁶

§231. Sacrifice of Property.

SINCE the other world is conceived of in terms of this, the dead have need of property of various sorts, and so their possessions are placed on the grave, usually being broken or destroyed beforehand for the purpose of releasing their

souls and thus making them utilizable by the ghosts. In a normal burial in the Solomon Islands the things belonging to the deceased are broken without any ceremony. Some say they do this because the deceased is cross and does "something no good" to the man who keeps them; others that they are broken to prevent anyone from stealing them, though here as elsewhere the taboo on the possessions of the dead is very strong. The most likely explanation given by the natives is that by breaking the articles their shadows go to the spirit-world. "They also break the shield and spears, and cut down the betel vines of the deceased and take some of it with areca to the burial place."¹ Among other Melaneseans, with certain exceptions, "the dead man's chief possessions, all carefully broken, are arranged by the side of the *bisa*; the centre of the bundle thus formed consists of broken spears thrust into the ground around which the other articles of property are wrapped and tied. . . . All these were so thoroughly broken as to be quite useless, but the dead man's bible—a mission has been established in Poreporena for 25 years—which entered into the composition of the *tobi* had not been torn up."²

In former times, among the Ewe-speaking tribes of West Africa, as soon as the king expired the women of the palace commenced breaking up the furniture, ornaments, and utensils, and then proceeded to destroy themselves; "the reason of course was that they might at once join their lord, and he be surrounded by familiar and useful articles."³ Among the natives of the Upper Congo "the cloths and clothes of dead men were buried with them, or if the article was out of the common it was first broken (killed) or torn, and then placed on the grave."⁴ When a Ba-Yaka dies all his pots are broken and left on the grave.⁵ In Nyassaland the relatives put the dead man's cooking-pots near his grave, "having first made holes in the bottom of them which render them useless to the living."⁶ When an Atharaka child dies the body is stripped of all clothing and ornaments; these are placed in a little heap by the side of the body in the bush. The spear and shield of a man are also left alongside his body. The author was informed that "theft of these things was quite impossible," and that "any man who did so would at once be suspected of having compassed the death of the owner and would be cast out by his people."⁷ A chief or person of importance among the Asabs of the Niger is not buried until the goods, necessary to represent his wealth and station adequately, can be brought together, to be placed in the grave with the body. Until that is done, his spirit is considered as existing in a betwixt-and-between state, neither of this world nor of the next. "This does not apply to a common man, whose friends on his decease contribute a few goods, and whose spirit passes directly to the next world." In northeast Africa, "trophies of the hunt and of war, captured spears, shields, genitals of slain enemies, pieces of elephant hide, beer receptacles, wooden staves which are to show how many cows the deceased possessed, sun shades, and tufts of women's hair are preserved on the mounds as a grave-decoration."⁸

In Siberia, when the corpse is brought to the spot chosen for the funeral, it is put on the top of a symmetrical pyre with its face toward the west. "Four men, one at each corner, stand with poles stirring the fire, and many objects

such as weapons, sledges, and pans, are broken up and, with the sacrificial dogs, are cast upon the pyre."⁹ The ornaments and implements hung on the Naga grave are consecrated and "anyone stealing them would surely die a speedy and miserable death."¹⁰ A clearer case of projectivism than that of the property-sacrifice at a Palaung burial would be hard to find: "A comb for the hair and a looking-glass are laid in the coffin beside a dead girl; a flute beside the body of a young man; a favourite toy, such as a top, or the large beans which are used in games, beside a child. Betel-nut and tobacco with matches are placed in all coffins, also cooked rice and curry. . . . No instrument for work is ever placed in a coffin [the other world is somewhat idealized]; but if a policeman dies, a small wooden sword and gun are taken to the grave and left there. When a baby dies, a few drops of milk from the mother's breast are put into a tiny joint of bamboo and placed in the grave." The nature of the other world is further seen in the practice of laying a small silver coin on the tongue of the deceased. "Both Palaungs and Pales follow this custom, but they have not all the same beliefs as to the use of the coins. They all believe that the money is given to be used in some way by the spirit as toll-money; some think it is to be given to the spirits haunting the graveyard; others that the ghost carries it, in ghostly form, to a closed gate on the path which all spirits must tread, and gives it to the guardian so that the gate may be opened; others again believe that it is offered to the old man and woman who guard the tree on which the fruit of forgetfulness grows. In one Palaung family only, I found that they believed that the ghostly path lay across a river, and that the coins were to be given in return for permission to cross a bridge. They all agree that if no toll-money is buried with the dead, the spirit cannot go to its appointed place, but must wander miserably, returning again and again to the house where it was happy in its last life."¹¹

When bodies were cremated by the Tlinkits, the ashes were carefully gathered and placed in a dead-house. "Deposited with the box of ashes were many possessions of the deceased, such as clothing, blankets, tools, food, water and other things. These were for his use in the spirit-land." A shaman was never cremated; his body was embalmed, and "things that he owned and prized in life were deposited with him. No matter how costly, they were never in any danger of being stolen, for the tomb of a shaman was regarded as especially sacred. No tomb, however, was ever in danger of being rifled by a native."¹² The Indians of Oregon practised surface-burial in small huts, canoes and goods of all kinds being placed with the corpse. "The explanation given of this custom was that the bodies were animated and moved about at night if they so willed, so easy exit from the graves was afforded and the things deposited were for their use under such circumstances."¹³ The most notable feature of the religious beliefs and ceremonies of the Pujunan family was the autumnal "burning"—the sacrifice of property to the dead, in which large offerings of all sorts of property were made by friends and relatives.¹⁴ Among the Cree, "the grave is made small and lined with blankets. The body is placed in it, upright, with legs drawn up, and with it are placed all personal property, a fact which accounts for the extreme rarity of antique articles among these Cree. A pipe and tobacco are always included, so that when the soul of the

deceased reaches the other land it can give the ruler a smoke, saying, 'my friends that I have left behind are forlorn; I pray you give them good fortune.'¹⁵ The Cheyenne dead were buried in their finest clothing. "If the dead man owned horses, his best horse was saddled and bridled, and shot near the grave. Sometimes several horses were so killed. If the body was put in a tree or on a scaffold, the horses were shot under it."¹⁶ In Guiana the property of the deceased was either buried or destroyed by fire. Such property might include his hammock, his weapons and domestic goods, his dog, even his wife or slaves. In many cases he was supplied with food also.¹⁷

Among the Araucanians, "the presents brought by the mourners are buried with the corpse, together with supplies of food, clothing and arms, to provide for his long journey. A sheep is sacrificed over the grave, and sometimes a horse, or the latter is buried with the corpse if the distance to the coast is considerable."¹⁸ The last detail is significant of the location of the spirit-world, as well as of the ideas concerning the souls of animals and of projectivism in general.

It was thought by the Old Norse that the more property burned with the corpse the more the ghost brought with him to Valhalla.¹⁹ In a barrow in Denmark there has been found an open coffin in which was a warrior of the Bronze Age in full dress and armor. The body had entirely disappeared, but the dress had been preserved by the acid from the oak wood. The whole contents were enclosed in a skin, probably of an ox. By the side of the corpse lay a bronze sword in a wooden scabbard lined with skin; at the feet was a large round box of wood, inside of it another smaller one, and in the last was a second woolen cap, with a horn comb and a razor of bronze. In a barrow in Jutland, in a coffin made of a hollowed oak tree, was found a woman's dress, also from the Bronze Age and again enclosed in cow-hide. In addition to some articles of clothing there were a bronze dagger, ornaments, and jewelry.²⁰ That there might have been some recognition of the waste incident to the burial of property with the dead is indicated in one of the Sagas, in which Thorfinn says: "I know that what wealth soever is hid in earth or borne into barrow is wrongly placed."²¹ In 1904 there was found in southern Norway a grave-ship of such dimensions and with such interior equipment as to surpass anything of the kind ever discovered before. The find had been the ship-grave of a queen of the province in which the present capital of Norway is situated. Its date is the middle of the ninth century, as shown by the language of an inscription found and by the style of the wood-carvings. With the queen had been interred a slave-woman, and also a complete outfit of personal and household effects, such as had been found nowhere else in the Scandinavian North. There was, for instance, a four-wheeled wagon, three sleighs of unusual workmanship, three beds, a chair, two chests, a large loom and other apparatus for weaving, a mass of cloths, all needed kitchen and household utensils—in short, nothing that could be required for the needs or the comfort of a woman of such station in the world beyond seemed lacking. Oxen and dogs for her journey had been buried with her and the bones of a span of horses were found. The ship was preserved in a specially constructed building and the objects in the Historical

Museum in Christiania.²² Among the Letts the custom still prevails of deliberately breaking receptacles at a burial so that the dead may not lack drinking-vessels in the other world.²³

§232. Treatment of the Body.

THE kind of burial given to the deceased and various other treatment of the body, notably the care taken to preserve it, are evidence of a belief that the spirit of the departed is still associated with it and may be propitiated by such means. Though the tribes of West Australia usually bury the body in the ground, occasionally they place it in a tree or in a hole in the rocks. "It would seem that this is a more honourable form of burial, reserved for those who are particularly esteemed as magicians or hunters."¹ In the Solomon Islands special attention is paid to the head of the deceased which, after the flesh is removed, is scrubbed clean with sand and salt water and bleached in the sun until it is white. It is then fastened on top of a stout post, on a sort of perch, and covered with thatching. Two small triangular holes are cut in this thatch, opposite the eye-sockets of the enclosed skull, and near by are deposited pipes, tobacco, rings, and food. At the conclusion of a hundred days the skull is removed and stored with those of the former chiefs or household lords. For the rest, when the flesh is completely gone from the bones, they are gathered together, cleaned, and buried either in the ground or, sometimes, in a cairn of stones like an altar, about which various old "properties" are placed.² In southeast Papua the dead of high rank were not buried, but the body was fastened on the top of a tree, with a well-thatched roof over it. When the bones dropped they were buried at the foot of the tree. "The person of low rank would be buried in the death-chair in a circular grave, and be put out of the way as soon as possible—even before the breath was out of the body. Those of middle rank were buried in the death-chair, but with much ceremony, and not until death had really taken place."³ Cases of mummification are reported from Torres Straits. "The body was placed on a platform with a fire beside it, partly for the comfort of the spirit and partly to aid in dispelling the noxious fumes arising during the process of desiccation. The corpse was then removed to the sea and cleaned, the interior being filled with pieces of dried sago palm. It was hung up to dry, and adorned by the insertion of pieces of nautilus shell for eyes; the body was smeared with ochre and oil, and various ornaments were attached to it. When dried, it was fixed to the central pole of the hut, and after some years the head was given to the widow, and the mummified corpse was taken to one of the gardens of the deceased and allowed to decay, or in some cases it was buried inside the hut."⁴

In West Africa, the declaration to a criminal that after his execution no funeral-rites will be held over his body, is to him more terrifying than death itself; for the latter merely transmits him to another sphere where he continues his ordinary avocations, while the former opens up to his imagination all kinds of ill-defined terrors.⁵ In Kenya Colony, East Africa, the kind of burial depends on the importance of the person: an old man who has grand-

children is buried to the right of the doorway, the place of honor; if the deceased has children, he is buried some distance from the hut, while if childless, his body is thrown into the bush for the hyænas and jackals.⁶ All the different peoples inhabiting Madagascar expend a large amount of time, trouble, and money upon their tombs and burial observances; "this care arises in great part from their religious notions, for they believe that their departed friends become divine, in a certain sense, and are able to benefit their descendants."⁷

Platform-burial is found not only among the Melanesians but among various Malay groups as well.⁸ The Jakun display scrupulous solicitude for the deceased's spirit, which is provided with a furnished hut to live in, provisions to feed upon, and even a trench full of water on which to paddle its canoe.⁹ Embalming was known and practised with surprising skill in one particular family of chiefs in Samoa; "they assigned no particular reason for this embalming, further than that it was the expression of their affection to keep the bodies of the departed still with them as if they were alive."¹⁰

The American Indians employed a great variety of methods for disposing of human remains, with the idea in each case, it seems, of doing homage to the dead. Among the Tlinkits of Alaska, orientation in burials was regarded as of importance, for it was believed that if the dead were not placed with their heads to the east they could not be re-born.¹¹ It was most essential among the Winnebagoes that a red mark be painted across the forehead of the corpse, then a black one immediately below this, and finally that the entire chin be daubed with red, "in order that he may be recognized by his relatives in spirit-land."¹² Mummification obtained in the historic period among the Aleuts and the Alaskan Eskimo; it was never used in the treatment of any corpses save of those of the rich and noble. The Aleuts mummified the bodies of both males and females of all the wealthy families. Among the Eskimo, however, only those males who did the whaling of the tribe were mummified, and even they were not equipped with all the paraphernalia of masks and effigies characteristic of Aleut mummies.¹³ The Tsimshian followed the custom in olden times, in the case of a prince or chief or rich man or somebody dear to them, of taking out and burning immediately the bowels, stomach, heart, liver, and lungs of the deceased; when the body was empty, it was filled with red-cedar bark and kept for a long time.¹⁴

The only locality in the United States where stone vessels are known to have been used for burial-purposes is southern California, where non-cremated human remains were buried in vessels of stone, covered in various ways. In Utah such remains have been found covered with baskets.¹⁵ Some of the extreme western tribes frequently practised burial on trees or scaffolds. The bodies of the chiefs of the Powhatan Confederacy were stripped of the flesh and the skeletons were placed on scaffolds in a charnel-house. For their ordinary burials they dug deep holes in the earth with sharp stakes and, wrapping the corpse in the skins, laid it upon sticks in the ground and covered it with earth. The Ottawa usually exposed the body for a short time previous to burial on a

scaffold near the grave. The Shawnee, and possibly one or more of the southern Illinois tribes, were accustomed to bury their dead in box-shaped sepulchers made of undressed stone slabs. The Nanticoke and some of the western tribes, after temporary burial in the ground or exposure on scaffolds, removed the flesh and reinterred the skeletons. Among the Athapascans the bodies of the dead were laid on the ground, covered with bark, and surrounded by palings, except in the case of noted men, whose bodies were placed in boxes on the branches of trees. The Santee buried their distinguished dead on the tops of mounds, built low or high according to the rank of the deceased, with ridge-roofs supported by poles over the graves to shelter them from the weather. On these poles were hung rattles, feathers, and other offerings from the relatives of the deceased. The corpse of an ordinary person was carefully dressed, wrapped in bark, and exposed on a platform for several days. "As soon as the flesh had softened it was stripped from the bones and burned, and the bones themselves were cleaned, the skull being wrapped separately in a cloth woven of opossum hair. The bones were then put into a box, from which they were taken out annually to be again cleaned and oiled. In this way some families had in their possession the bones of their ancestors for several generations."¹⁶

Three forms of burial were utilized by a division of the Miami: (a) the ordinary ground-burial in a shallow grave prepared to receive the body in a recumbent position; (b) surface-burial in a hollow log—sometimes a tree was split and the halves hollowed out to receive the body, when it was either closed with withes or fastened to the ground with crossed stakes; again a hollow tree was used, the ends being closed; (c) surface-burial wherein the body was covered with a small pen of logs, laid as in a log cabin, the courses meeting at the top in a single log. The Sauk, an Algonquian tribe, practised four different methods of burial: (a) the corpse was laid away in the branches of a tree or upon a scaffold; (b) it was placed in a sitting posture, with the back supported, out on the open ground; (c) it was seated in a shallow grave, with all but the face buried, and a shelter was placed over the grave; (d) there was complete burial in the ground. Some of the Carolina tribes first put the corpse in a cane hurdle and deposited it in an outhouse for a day; then it was taken out and wrapped in rush or cane matting, placed in a reed coffin, and buried in a grave. The Montagnais, who buried their dead in the earth, usually laid the corpse on its side, though sometimes the sitting position was chosen. "Above the grave is built a little birch-bark hut and through a window the relatives thrust bits of tobacco, venison, and other morsels." The bodies of the dead among the Hopi were sewed in blankets and deposited with food-offerings among the rocks of the mesas.¹⁷ The Cheyennes let wild animals "bury" their dead; "men thought it well that the wolves, coyotes, eagles, buzzards, and other animals should eat their flesh, and scatter their bodies far and wide over the prairie."¹⁸

Sometimes the bones alone were buried, for it appears to have been a custom in the Northwest as well as in the East and Southeast to remove the flesh by previous burial or otherwise, and then to bundle the bones and bury them, sometimes in communal pits. Among the Choctaw, the work of cleaning the bones of

16 Mooney and Thomas; Mooney; Goddard and Swanton, in HAI, I, 42-43, 599; II, 301, 461; I, 110, respectively.

18 Grinnell, *Cheyenne*, II, 163.

the dead before depositing them in boxes or baskets in the bone-houses was performed by "certain old gentlemen with very long nails," who allowed these attachments to grow with this purpose in view. The people of this tribe followed the custom of setting up poles around the new graves, on which they hung hoops and wreaths, to aid the spirit in its ascent.¹⁹ The custom of removing the flesh before final burial prevailed extensively among the mound-builders of the northern districts and was not uncommon among those of the south; cremation also was practised by them to a limited extent. In Kansas stones were heaped over the body to form a cairn, while a custom once prevailed among certain tribes in Wisconsin, on the burial of a chief of distinction, to consider his grave as entitled to the tribute of a portion of earth from each passer-by; hence the first grave formed a nucleus around which, in the accumulation of the accustomed tributes of respect thus paid, a mound was soon formed.²⁰

Certain Arawaks are said by Schomburgk²¹ to be the only tribe in British Guiana that burn their dead and bury the ashes. Another tribe of the same stock disinter the corpse about a month after the funeral, put it in a great pan or oven over the fire until it is only a black carbonaceous mass, which is pounded into a fine powder and mixed in several large vats of a certain liquid, to be drunk by the assembled company. In the lands back of Cayenne there are tribes that imbibe the ashes of the dead which they mix with their drink, "believing that by this means they are giving the defunct a more honorable burial than by leaving them a prey to worms and corruption." Among the Caribs, at the expiration of the year, the decomposed body is dug up and the bones distributed to all the friends and acquaintances. "The bones, having been cleaned by the fish, are packed according to size in a basket already provided, worked with glass beads of various colors; care is taken that the skull of the deceased forms the lid of the basket. The basket is then hung up to the roof of their houses . . . along with the many other baskets containing the bones of their forefathers. The women . . . who prepare the bones are considered unclean for several months."²²

The Egyptian cult of the dead was highly elaborated. To be able to share in the happy fate of future life, one must leave nothing undone. Hence the great care bestowed on the corpse, the embalming, the deposit of the intestines in the four vases consecrated to the genii of death, the dedication of each member to a divinity, the well-sealed graves, the rich sacrifices for maintenance which were offered either directly to the deceased or to the gods with the request that the dead be given his share, and the many magical ceremonies in which precise magic texts must be recited in the right tone in order to restore to him the use one after the other of his limbs and support him in his struggle—not to mention all the objects which were given to him to take along on the great journey. All these were, however, only a part of what one must observe in order to face the dark future with confidence. Even the righteous man was not safe if one detail had been neglected. Wherefore there were gathered together a species of canonical books with all the prayers that were to be spoken. Here belonged the ritual of mummification and of sacrifice to the dead. At

19 Swanton; Thomas; Gatschet, in HAI, I, 288; I, 945; I, 286, respectively.

this sacrifice, certain ceremonious actions were performed partly on the mummy and partly on the image of the deceased—the first being the mystical opening of the mouth and eyes to restore to the deceased both speech and sight. Then, through the laying-on of hands, the blood of the gods was brought into the dead; through magical means color was restored to the lips and cheeks and flexibility to the jaws; and finally the dead, even as the gods, were presented with clothes, perfumes, fetishes, and amulets.²³ It was the old belief of the Hamitic peoples, shared also by the Iranians, that the deceased continued to live a shadow-like existence and that his resurrection, or at least his arrival in a blissful other world, was dependent on the preservation of his mortal remains.²⁴ In ancient Rome the first duty of the heir was to perform the obsequies; the Earth yielded her fruits to one who conveyed to her the corpse due her.²⁵ Odin is said to have ordered that tumuli should be built over the bodies of distinguished men and that stones should be set up over all who showed manliness.²⁶

§233. Miscellaneous Forms of Propitiation.

THE East and South Australians provided a semblance of a duel, somewhat like the Roman gladiator-fights at a funeral, with light effusion of blood.¹ It was a universal custom in the Fiji Islands to invoke the ghosts of fathers and remoter ancestors: houses were sometimes built on graves as peace-offerings on behalf of a sick child; feasts and other sacrifices were made to the souls of men, and in offering them the votaries mentioned the father's name in the prayer. "This cult of the dead goes on at the present day in secret."² When a Koita dies, all his relations come in mourning-costume to his village and "immediately on arrival proceed to the dead man's house, where they 'kiss' his face, i.e., they touch his face with their noses, but do not inspire as they do when 'kissing' the living."³

There is a certain compulsion to perform the obsequies correctly and fully. The South Africans believe that many strokes of ill luck are due to the grudge or anger of a deceased chief who is not satisfied with the ceremonies performed at his grave.⁴ Among the Edo-speaking peoples, non-performance or irregularity in attending to burial-customs entails penalties both on the deceased and on the living. The dead man takes with him to the other world the yams and other things offered at his funeral; but his family there assembled, after taking possession of them, may decline to recognize him as one of themselves so that he becomes a sort of spiritual outlaw. He must be in receipt, as it were, of an income from earthly sources. "He is, however, in a position to wreak his vengeance on the defaulters by making them ill, by preventing their wives from bearing children, and by causing them to lose their property. The remedy is for the son to kill a goat and beg his father to relent;" how far this affects the lot of the deceased the author did not ascertain.⁵ A death in a family among the Ewe-speaking peoples is announced by an outbreak of shrieks and lamenta-

tions on the part of the women, who throw themselves on the ground, strike their heads against the walls, and commit a variety of extravagances, meanwhile calling upon the deceased not to desert them and endeavoring, by all kinds of supplications, to induce the soul to return and reanimate the body.⁶ No doubt some at least of this ostentatious mourning is conventional and ritualistic, for the ghost is thought to be pleased by much and loud lamentation. Glave⁷ says that "there is no sympathy for another's pains in the soul of an African;" that the tears for a chief are only part of the funeral ceremony, though a mother may show real grief at the loss of a child.

The Yaos of Central Africa regard the soul or shade, after a person's death, as an object of worship and reverence, the controller of the affairs of this life, the active agent in the fortunes of the human race—which is an extension of the ghost-theory toward daimonism. Shrines are erected over the graves and many objects offered there. At the head of the mound a native pot is fixed in the ground for the reception of the offering of beer which is an almost invariable accompaniment of any act of worship paid to the shades of the dead. Should a long-continued drought endanger the prospects of the grain-crop, the departed chief must be solicited to send the lacking rain.⁸ Each person among the Baganda keeps a small hut near his house where the spirits of deceased relatives reside; the latter are propitiated to obtain benefits. "If the suppliant had been sent to the *sabo* (hut) of one of his relatives he would kneel by the door and address the ghost inside; he would first recount all his troubles, and then make a promise of some present to the ghost according to his rank, and then beg its assistance or challenge it to overcome the other spirits. . . . The animal or fowl dedicated to a deity is turned loose by the hut (*sabo*) and always kept there as the property of the ghost, and replaced in case of death; if it is only a skin or feather it is tied to the doorpost, but the bark cloth is placed inside the huts; it is, however, removed to clothe the sick person for a time, who thus derives the ghost's assistance to throw off the illness." These huts of the ghosts are kept in good repair; they vary in size according to the honor of the ghost, some being small huts only a couple of feet high, whilst those of kings and other important personages are sixty feet high and afford accommodation for the priests to live in. "Offerings of animals, slaves, food, clothing, firewood, and beer, are frequently made at these shrines; the offerings are made to obtain some benefit, such as recovery from illness, to avert some calamity, sickness, or war, or again in fulfilment of a vow."⁹

Each caste in India had its fetish which brought quality into the rites for the soul—rites which must be kept up by descendants, else the soul lost rank and slipped down to a stage where it must go through the world again. Some souls hang head-downwards over an abyss of hell because they have no descendant to sacrifice for them.¹⁰ In China, descendants expect that the great work of interment will secure them wealth, glory, and prosperity for all future ages; the things of good omen which are placed in the tomb are thought to cause the benefits they express or symbolize to become real blessings to the offspring of the deceased. "It is by no means merely a desire to ensure a happy fate to the dead which prompts children to place a hair-pin . . . on the deceased:

the hope that it may serve with all its appendices like seeds sown, and ripen into real happiness and old age for the offspring, plays by far the greatest part in it. This also explains why the Chinese are so partial to dressing their deceased mothers in bridal attire:—this being in reality the uniform dress of mandarins' wives and, moreover, covered all over with symbols of felicity, wealth, joy and longevity, it will undoubtedly endow each woman, who wears it in the tomb, with the faculty of procreating happy, wealthy and long-lived descendants holding high functions in the empire—the greatest bliss and honor imaginable for every true son of China."¹¹

Hired mourners were common among the Tlinkits and many other services connected with burial were paid for.¹² The following custom was observed among the Omaha and cognate tribes: "On the death of a man or a woman who was respected in the community, the young men, friends of the deceased, met at a short distance from the lodge of the dead and made two incisions in their left arms so as to leave a loop of skin. Through this loop was passed a small willow twig, with leaves left on one end; then, with their blood dripping upon the willow leaves, holding a willow stem in each hand, they walked in single file to the lodge, and, standing abreast in a long line, they sang there the tribal song to the dead, beating the willow stems together to the rhythm of the song. At the sound of the music, a near relative came forth from the lodge and, beginning at one end of the line, pulled out the blood-stained twigs from the left arm of each singer, and laid a hand on his head in token of thanks for the sympathy shown. The song continued until the last twig was thrown to the ground. The music of the song was in strange contrast to the bloody spectacle. It was a blithe major melody with no words, but only breathing vocables to float the voice." According to the Indian explanation, the song is for the spirit of the dead; it is to cheer him as he goes from his dear ones left behind on the earth; "so, as he hears the voices of his friends, their glad tones help him to go forward on his inevitable journey." The song is therefore addressed directly to the spirit of the dead. Of the ceremonial it is further explained that the shedding of the blood is for the mourners; they see in it an expression of sorrow and sympathy for the loss that has come to them.¹³ The main ceremony of the Paiutes is an annual mourning-ritual or "cry," which generally lasts for five days in June or July; essential elements are the singing of numerous mourning-songs and the offering of valuables, such as baskets, articles of clothing, and horses, in memory of the dead. "At various stages during the singing, which forms the major part of the ceremony, ceremonial 'cries' take place which are conducted by a cry leader. On the last night of the mourning ceremony, during which it is forbidden to sleep, the articles which have been set aside as offerings to the dead are burned on a funeral pile; horses are shot, and valuable articles which have been exposed as offerings may be taken by others and replaced by objects of less value. It is evident that the Paiute mourning ceremony bears considerable resemblance to mourning ceremonies of various Californian tribes."¹⁴ It is also evident that much of it is conventionalized. The Ahome are said to have uttered cries and lamentations for their dead during one entire year, for an hour at sunrise and another

at sunset.¹⁵ Among the Mariposan family there was an elaborate annual mourning-ceremony for the dead of the year, which took place about a large fire in which much property was consumed. This ceremony, described as the Dance of the Dead, was followed by dancing of a festive character.¹⁶ It was customary for the Otomacs to bewail their dead as a matter of daily routine; thus, "as soon as the cocks crow, about 3 o'clock in the morning, the air is rent with a sad and confused sound of cries and lamentations, mixed with tears and other appearances of grief. They mourn not by way of ceremony, but in very truth. When day breaks, the wailing ceases and joy reigns."¹⁷ In antiquity the fear of the horrors of the realm of the dead were so powerful that people established funds or made contracts to assure for themselves in perpetuity a light in the temple, food for their maintenance in the burial chapel, and the service of their own priests. Among the Semites the great solicitude for the corpse, the inviolability of graves, the rich presents which were given to the dead for his sustenance and well-being, the loud lamentations, the sacrifice of hair, the wounds which were self-inflicted at the burial and in which one may see a substitute for earlier human sacrifice—all these witness to a fervent desire to gratify the soul and to a fear that it might otherwise take revenge for being neglected. The grave was the eternal home from out of which the dead went to rest in Sheol with the shades; if they were unburied or their graves desecrated, then their shades would have to wander dismally about and haunt places without finding rest.¹⁸ In the Gilgamesh Epic, the ghost of Eadni tells Gilgamesh that those only are happy in Hades who died in battle and that the ghosts of those whom their relatives have forgotten suffer hunger and thirst.¹⁹

There is to be found in Homer but slight indication of apotheosis, of worship of the dead, or of sacrifices at their tombs, although the graves at Mycenæ, with openings to convey the offerings as directly as possible to the corpse, bear witness to the existence of such worship there long before Homer's day, and similar customs continued through the classical period. "The Homeric dead had no power to harm or to help, and no reason existed for propitiating them or for striving to please them in any way. Only slight indications are found in the poems of any sort of sacrifices, or offerings to the dead, but not only were these honors to the dead paid in Plato's time, when to secure them was a prime motive for marriage, and in the age of St. Chrysostom, who was scandalized by them, but the belief in their importance is very real in Greece to-day. In this matter the poet seems, indeed, as a very high authority has said, centuries in advance of his age."²⁰ One way of propitiating the deceased, according to the notions of the old Romans, was to take vengeance on the enemy of one's dead father: Cato said the libations which the manes of our ancestors crave are the tears of their condemned enemies.²¹

§234. Antagonism of Dead and Living.

We speak, says Lippert,¹ of "sacrifice" to the dead; a share in all that the living like, need, and get is given to them. Sacrifice is really a toll; hence the fear that

it may not be great enough or that the "envy" of the spirits or gods will be provoked. It involves destruction, surrender, or loss made or incurred for the sake of some benefit expected in return. The sacrifice of property is sometimes so great that there is economic pressure against the practice; some primitive peoples are aware of the conflict of interests involved. The economic cost of mortuary practices was very considerable in the Savage Islands where "all the plantations, cocoa-nut trees, and other fruit trees of a person who died, were destroyed and thrown into the sea that they might go with him to the world of spirits."² In New Georgia the property of the dead man remained untouched for a hundred days.³ In New Britain there was a scramble for the different articles thrown upon the sacrificial fire; "the dead man's soul was welcome to the shadow or spirit of these things, but it would be a pity to have the things themselves wasted."⁴ By exception, the Murray Islanders supplied no food for the spirits' journey.⁵

In South Africa, trees, garden, and huts may be abandoned after a death; this practice, says Livingstone,⁶ renders any permanent village impossible. There are some attempts, however, to avoid giving up all the dead man's property, for among the Kaffirs an old woman would hold up the weapons and other articles at the grave and say, "Behold all that is thine," and then would carefully take them away again.⁷ In West Africa the "destruction of his property is intended to signify to the soul that he must now depart, since there is no longer anything belonging to him. In former times the destruction of property was carried much farther than at present."⁸ "Ghosts have the same passions, appetites, needs, and necessities as living men; therefore, in the grave with the corpse are placed food and drink, tobacco, pipes, gold-dust, trinkets, and cloths, according to the wealth and position of the deceased." The entire body may be powdered with gold-dust. The value of such articles, in the case of persons of distinction, not infrequently amounts to some two or three hundred pounds sterling. "These sacrifices are repeated a second and third time. It is a point of honour amongst all but the most abjectly poor, to make a great display at funeral ceremonies; and families endeavor to outvie each other in extravagance. This is a common cause of debt and slavery, and poor people frequently pawn or enslave themselves in order to obtain the means of making a respectable funeral."⁹ "As wealth in the Delta consists of women and slaves," writes Miss Kingsley,¹⁰ "I do not believe the under-world gods of the Niger would understand the status of a chief who arrived before them, let us say, with ten puncheons of palm oil, and four hundred yards of crimson figured velvet." One king of Atta became very rich in cowries and other valuables which were all buried with him. His son and successor, poor and unhonored as a consequence, opened the grave to get the property and cut off the head of the corpse to punish his father for selfishness. The people were so shocked at this breach of custom and act of impiety that they rose in rebellion against the offender.¹¹ Burial-costs piled up so high in Togo that the negroes "hit on the practical thought of celebrating common funerary festivals for several of the dead."¹² The Guinea Coast grave-hut "contains everything which a living per-

son needs."¹³ Certain Baghirmi chiefs, "when they feel death approaching, have their movable possessions cast into the river."¹⁴ Among the Unyamwesi the oxen of the deceased chief are often all killed and eaten, though no offerings are made on the grave.¹⁵

The relatives of a deceased Osetin dispose of his possessions without consent of his heirs, buy drink with the proceeds, and eat and drink up the property as they please.¹⁶ Though the boats and nets of certain northern Asiatics are their most valuable and indispensable possessions, they sacrifice both at a death.¹⁷ There is some tendency here to avoid funeral-waste, for the Chukchi who have customarily sacrificed reindeers and dogs, their most valuable property, sometimes offer substitute sacrifices—reindeer made of willow-leaves or even of snow.¹⁸ In A.D. 992 the Tungus of Mongolia were forbidden by their ruler to sacrifice horses at funerals or to place harness, helmet, or gold and silver utensils in the grave; and in 1042 another ruler interdicted under penalty of punishment the sacrifice of reindeer, horses, and other valuables. These commands were undoubtedly prompted by economic motives.¹⁹ In western China, when the coffin is being carried out for burial, a paper effigy is placed upon it, which represents clothes for the soul of the dead man.²⁰ In southern China they burn, close to the grave, small paper houses, paper clothing, tiny painted models of chariots harnessed with mules, palanquins, and other objects. Providing the dead with these paper models and also with tinfoil taels—"ghost money"—is a large industry, the yearly production of the latter amounting to fifteen million dollars.²¹ Main²² cites a number of cases of models being sacrificed instead of the real things, in an attempt to escape the burden of funeral-waste; he thinks that the widow's services to the grave and to her deified husband are of this nature—a substitute for former human sacrifice. In Korea food is offered monthly and on anniversaries, "all the descendants assembling, and these observances extend backwards to the ancestors of five generations. Thus it is a very costly thing to have many near relations and a number of ancestors, the expense falling on the eldest son and his heirs. A Korean gentleman said that his nephew, upon whom the duty fell, spent more upon it than upon his household expenses."²³

The main object of a Hindu funeral is very different from that of European obsequies. "It is nothing less than the investiture of the departed spirit with a kind of intermediate body—a peculiar frame interposed, as it were parenthetically, between the terrestrial gross body which has just been destroyed by fire, and the new terrestrial body which it is compelled ultimately to assume." Were it not for this intermediate frame—believed to be created by the offerings made during the funeral ceremonies—the spirit would remain with its subtle body in the condition of an impure and unquiet ghost wandering about on the earth or in the air among demons and evil spirits, and itself condemned to become an evil spirit. Its reception of the intervenient body converts it from a ghost into an ancestor. But this does not satisfy all its needs: "the new body it has received, though not so gross as that of earth, must be

developed and supported. It must, if possible, be rescued from the fire of purgatory. It must be assisted onwards in its course from lower to higher worlds and back again to earth. And these results can only be accomplished by the ceremonies called *Śrāddha*—ceremonies which may in some respects be compared to the Roman Catholic masses for the dead." The first *Śrāddha* is performed very soon after the funeral-rites and is always a costly affair. The funeral-ceremonies of the older members of a family occupy ten days, and with the succeeding *Śrāddha* rites, carried on with the help of Brahmans and including the feasting of numberless guests and the distribution of presents, may involve an enormous expenditure. "It is well known that the expenditure incurred on such occasions by rich Bengal *Rājās* and *Zamindārs* of high family has often impoverished them for the remainder of their lives. Instances are on record of a single funeral and *Śrāddha* costing a sum equivalent to £120,000, the greater part of that amount being squandered on worthless *Brāhmans*, indolent *Pandits*, hypocritical devotees, and vagabond religious mendicants." This funeral sacrifice is described as "an evil which has gradually grown till it has become a veritable curse to the country, and one of the principal bars to any advance in its social condition."²⁴ The spirit of a deceased Brahman is "the most difficult of all to propitiate. A timber merchant at Calicut some time ago spent more than a thousand rupees [\$320] for this purpose."²⁵ Sometimes the funeral-expenses include gifts to charity to commemorate the name of the deceased: "during the five years, 1884 to 1889, the Parsee community of India has given about forty lacs of rupees [a lac, or 100,000, of rupees is about \$32,000] in public charity. Of this sum more than half was announced at these funeral gatherings of the third day after death."²⁶

Fawcett²⁷ was told that all a *Saora's* money was buried with him, but he is doubtful about it; he believes a little money may be destroyed. Even the *Todas* are trying to avoid the funeral waste. In their obsequies the body is swung three times over the fire and then replaced on the ground before it is finally lifted upon the pyre; then, before the last act, nearly all the objects of value are removed from the bier or from the pocket of the cloak. In one case Rivers²⁸ observed that the bangles were taken from the arms and all the rings except one from the fingers, and the coins were removed and redistributed to those who had given them. The people told him that when the body was swung over the fire, the dead person went to *Amnodr* with all the ornaments and objects then on the bier and that the removal of the things afterwards would not deprive the dead person of their use in the next world—an expedient rationalization. "It would seem as if this ceremony of swinging the body over the fire was directly connected with the removal of the objects of value. The swinging over the fire would be symbolic of its destruction by fire, and this symbolic burning has the great advantage that the objects of value are not consumed and are available for use another time." The funeral-ceremonies have undergone some modification in recent times owing to the intervention of the Government. The former custom of slaughtering many buffaloes at every funeral impoverished the people and was prohibited by the Government about forty years ago; since that time the number of buffaloes killed at each ceremony has been limited to two for each person.

In the Malay Archipelago it is thought that if a dead man reaches the spirit-world without proper equipment he not only suffers want but the other ghosts dishonor him. The richer the soul, the higher the honor and rank that await him in the next world. Funerals are often postponed for years until wealth can be accumulated, to be burned, broken on the grave, or buried.²⁹ A new rajah may be reduced to poverty through the provision made for his predecessor³⁰ just as a father, unfortunate in his family, may be ruined by the death of his children to whom he must furnish capital with which to begin life in the new existence. When a man of property dies in Sarawak, "sago trees are cut down with the belief that they will be found ready-grown for the owner's use in the other world."³¹ "The articles of clothing and weapons deposited with the dead are of the highest value, no broken or damaged article being deemed worthy of a place in the grave." This is the case with the Sea Dyaks; elsewhere valuables are spared and there are sacrificed "merely a few old things, that even sacrilegious strangers would scarcely think worth plundering."³² In the Mentawai Islands the trees of the dead man are regularly cut down.³³ Delay of the funeral until sufficient property can be collected for destruction is common in Timor.³⁴ Among some of the natives of the Philippines, where dishes, earthen pots and other articles are broken on the grave, there is some attempt to avoid complete impoverishment of the survivors; "all the belongings of the deceased, except such bare necessities as may be needed by his immediate relatives, are left at the head of the grave."³⁵

The East Greenlanders throw away or bury all the dead man's possessions except knives and things similarly precious.³⁶ The Bering Strait Eskimo "fear to die unless they have someone to make offerings to their memory, and childless persons generally adopt a child so that their shades may not be forgotten at the festivals, as people who have no one to make offerings for them are supposed to suffer great destitution in the other world." The souls appear at the feast of the dead to take back with them the spiritual essence of new garments; then these are solemnly put on by their namesakes.³⁷ A feast must be held whenever a Tlinkit dies, whether man, woman, or child; it cannot be omitted, as it would be regarded as a woeful lack of respect to the dead and would bring deep reproach on the family. Feasts are given for many purposes, such as to honor the dead, to benefit them, or in commemoration. There is nothing the Tlinkit likes better than to hold a feast. "Where the sick have been expected to die and then have recovered, natives have been known to be greatly disappointed and to regret the recovery, as the feast they anticipated in case of death did not come off. For this reason some are not urgent in employing a doctor when relatives are sick." While the feasting is in progress, food is thrown into the fire and the name of the dead in whose honor the feast is held is called out. The fire-spirit in some way conveys the food to him in the spirit-land. "If the feast were omitted, or a poor feast given, the spirit of the dead would feel badly about it and reproach relatives so remiss in their duty." At this feast all obligations incurred in the cremation or burial of the dead are met and extravagantly paid for. "The natives are not satisfied unless much

money is spent." Everything done for the dead is by those of another totem than that of the deceased; the guests must be those of a different totem from that of the feast-givers. A feast is usually held immediately after the death of a person, but not always. "Death may occur when it is inconvenient for the friends of the deceased to give one at once. They may be too poor, or it may be in the summer time when the people are scattered. But as soon as the relatives of the dead can accumulate the means and the people are back in the village, then the celebration in honour of the memory of the dead must be given." With the Tlinkits no other event is so costly or involves so much as death. Articles of clothing and bedding, playthings for a child, and always a vessel of water are buried beside the coffin. "Sewing-machines, clocks, guns, and various other articles such as were used and prized in life are often deposited on the grave." Large sums are exacted for services rendered. "The most trifling service, such as putting gloves on the hands of the dead, or socks on his feet, or mourning, must be well paid for. Four young men acted as pallbearers for a little child. The mother gave them ten dollars each for this slight service. To build a coffin, dig a grave, erect a grave fence or tombstone commands a large compensation. This is largely due to the fact that the natives are not satisfied unless they spend large amounts on the dead." By the time the various claims and the other expenses have been met, two or three hundred dollars have been swallowed up, which is a very considerable amount among these primitive Alaskans; but every penny of this is cheerfully paid, as it would be a deep disgrace to refuse any of these claims. Indeed, there is an element of vanity here, as is seen in the feasts given for other purposes and in the potlatch, and the Tlinkits are actually fond of giving feasts for the dead. "They will even exhume bodies and bones to bury them in some other spot in order to have an excuse for such feasting."³⁸

When a Cheyenne died, "all his property not placed with him—and often that of his father and even of his brothers—was given away, and to people who were not his relations. . . . Then the lodge was torn down and given to someone, and soon everything was gone, and the widow perhaps retained only a single blanket with which to cover herself." Death often meant the break-up of the family, for if a man died leaving a widow and, say, two or three growing children, they would have nothing after this funeral-waste, and the children would have to go to their grandfather or uncles and live with them for a year or two. "In the course of this time, however, some one of her relatives was very likely to have given a lodge to the widow, and she camped near a brother, who supplied her with meat; and after a time she began to get her children back, one by one, until at last all were living with her again. If she had growing boys, they learned to hunt, and assisted in supporting her and the sisters. Such a family always got along somehow."³⁹ The practice of abandoning not only the property and hut of the deceased but even the village where the death occurred, naturally meant great loss.

Mindeleff⁴⁰ has effectively described the hardships incurred through the practice of avoidance. "The occurrence of several years of drought in succession would be construed as a mark of disfavor of the gods, and would be followed by a movement of the people from the village. Even a series of bad dreams which might be inflicted on some prominent medicine-man by over-

³⁸ Jones, *Thlingets*, 135-136, 137, 147-149, 150, 200.

³⁹ Grinnell, *Cheyenne*, II, 162-163.

⁴⁰ In BAE, XIX, pt. II, 646.

indulgence in certain articles of food would be regarded as omens indicating a necessity for a change of location. Such instances are not unknown. Toothache also is dreaded for mystic reasons, and is construed as a sign of disfavor of the gods; so that many a village has been abandoned simply because some prominent medicine-man was in need of the services of a dentist. Many other reasons might be stated, but these will suffice to show upon what slight and often trivial grounds great villages of stone houses, the result of much labor and the picture of permanence, are sometimes abandoned in a day." Among the Guiana Indians, who desert the hut and even the village visited by death, it may happen that the fields are all prepared for the crops or even that the seed has been planted. Yet the fear cannot be overcome that tarrying longer is perilous because displeasing to the spirits. Sometimes a bit of thrift creeps in, however, for one of the tribesmen may be deputed to watch the crops.⁴¹

Cases of avoidance where the dying are taken outside, so that death may not pollute the dwelling and necessitate its abandonment or destruction, are to be interpreted as an attempt to squirm out from under the economic burden of death. The clash of interests between living and dead continues for some time, for the welfare of the ghost in the other world is dependent on the sacrifices of the survivors. In Mexico it was held that ghosts, if neglected, would become animals. "If the dead person has been a particularly bad man, the medicine men have a hard time in rescuing him from the animal kingdom. It may take hours of prayers and dances to get his head through and then hours more of other dances and incantations with herbs and hikori to rescue the rest of his body." If people cannot pay the medicine-man, their ghosts may wander indefinitely as animals.⁴² On such a basis is built the concept of purgatory; moreover, it is especially to be noted that the living have their part to play, and pay, in the process of expiation.

§239. Ancestor-Worship.

THE Central Australians, who are said to have no idea whatever of the existence of any supreme being, are firmly convinced that their ancestors were endowed with powers such as no living man now possesses. They could travel underground or mount into the sky; could make creeks and water-courses, mountain-ranges, sand-hills, and plains. "In very many cases the actual names of these natives are preserved in their traditions, but, so far as we have been able to discover," comment Spencer and Gillen,¹ "there is no instance of any one of them being regarded in the light of a 'deity.'" So in the Loyalty Islands, "the natives had no idea of any God or devil, heaven or hell. Their religion or superstitious feelings were in connection with the departed spirits of their fathers."² Among the Elema tribes of British New Guinea the name for ancestors, *ualare*, is that by which all sacred objects are designated. The ancestor-cult here is involved with the totemic system, for certain animals are *ualare*, and as these were never injured or eaten by the ancestors, so their descendants hold them sacred; even natural objects or phenomena may be *ualare*. Certain generalities may be drawn from this complicated situation: (a) All tribal *ualare* are regarded as deities who in the long ago temporarily assumed human form when they became the ancestors of the respective tribes, and at the same time

⁴¹ Roth, in BAE, XXXVIII, 639.

² Ray, in JAI, XLVII, 295.

appropriated certain areas for their posterity, which they furnished with vegetable food. Some of the immediate descendants of the several original ancestors are credited with his supernatural attributes. (b) Clan *ualare*-deities are ancestors who acquired their powers from the father or from the mother (where descent is matrilineal), who created himself or herself from a natural object or is a nature-deity. (c) Individual *ualare*, unlike the others, are not inherited. A personal *ualare* may be that of either parent or of the person, living or dead, after whom the person is named, or adopted as the result of a dream. Every man has two *ualare*, such as a dog, a pig, a wallaby, a bird, a fish, or a tree, which he may not injure or eat.³

More unified is the system of ancestor-worship of the Fijians, who had an evolved set of ancestral gods, the Kalou-Vu. A deceased ancestor was a god; he had his temple, his priests, who themselves must become hereditary, and there was a strong motive of self-interest in keeping his memory green. "Being a god he conferred on the chief, his direct descendant, a portion of his godhead, and set him within the pale of the *tabu*, so that the chief's will might not be disobeyed nor his body touched without evoking the wrath of the unseen." Often the chief was metamorphosed into the tribal deity, and two tribes which had the same ancestor-god, that is, "were sprung from the same root," always refrained from fighting one another. "Members of that tribe may enter their village, slaughter their animals, and ravage their plantations, but they will sit complacently by; they are brothers and worship the same god."⁴ One case is mentioned among the Fijians where the ancestral gods were light-colored, straight-haired men, probably Polynesians, who, owing to their prowess and personal appearance, were adopted by the Melanesian inhabitants of that period. "Time and ancestor worship have accorded divine honours to these illustrious strangers, and they were worshipped as the founders of the tribes they joined."⁵ In the Trobriands, names of ancestral spirits are recited in the magical spells; in fact, "these invocations are perhaps the most prominent and persistent feature of the magical spells."⁶ The Savage Islanders and the natives of New Caledonia worshipped the spirits of their ancestors, whose relics they preserved and idolized. At one place the latter people had wooden idols before the chiefs' houses. The office of priest was hereditary and almost every family had its priest. To make sure of favors and prosperity they prayed not only to their own ancestor-gods, but also, in a precautionary way, to the gods of other lands.⁷ Until recently the Andaman Islanders had no knowledge of the outside world; the few voyagers who ventured near their shores were regarded as deceased ancestors who had been allowed to revisit the earth.⁸

It is well to keep on the good side of ancestors, for they bestow or withhold favors according as they are pleased or offended. Should anyone of the African Kaffirs dream about his ancestors who are dead, it was taken as an indication that they were displeased at some neglect and demanded a propitiatory sacrifice. Should there be illness either of man or beast, and a doctor declare: "I see, your ancestors are displeased because you have not rendered them their due," it was understood that a sacrifice was demanded. And should there be no rain, the people would go to the chief and ask: "Why do you allow it to be thus? Why don't you invoke your ancestors?" Whereupon he would offer

a sacrifice.⁹ In West Africa the word "spirit" is a conception from which often the signification of "deceased ancestor" has been lost.¹⁰ In the matter of belief in ancestral spirits, there appears to be very little difference between Central Africa and Europe; "for they seem to be merely the souls of the departed which received such marked attention in Europe even up to present times, as for example the Feast of All Souls and St. John's Eve." The reality and imminence of the influence of the ancestral spirits upon the daily life of the natives cannot readily be realized. An evil-disposed ancestral spirit, for instance, will sometimes enter cattle to kill them; "the people know when a beast is so possessed by the animal shaking its head and by tears streaming from its eyes." The ancestral spirits may live underground or inhabit certain sacred fig-trees. The latter belief is found along the east coast of Africa and is prevalent all over India; "it is stated that in Burmah to this day the Government pays to the headman of certain forest tracts a fee called *murung* for appeasing the *manes* of their ancestors lodged in old *sal* trees."¹¹

In East Africa ancestral spirits are thought to be able to cure disease. The method of treatment is as follows. After both legs and wings of a bird have been broken and a string passed through the under-beak, it is suspended round the patient's neck, whilst the ancestral spirits are thus addressed: "This is the custom, that we follow with this bird; if this person be cured to-day, we will give it to you to eat;" or "Grandfather, great uncle (or grandmother, great aunt, as the case may be), I give you this bird, cure now therefore this patient."¹² As with all Bantu faiths, so with the Awemba religion, ancestor-worship is the mainspring of their theology. Other Bantu tribes have no genuine nature-spirits, but appeal in all things, for rain and everything else, to the spirits of their ancestors. It is safe to conjecture that the spirits of very ancient chiefs have been exalted to the state of ancestral gods by the natives to whom their names, shrouded in the mists of antiquity, have become as mythical and meaningless as the prehistoric Dorus and Ionus were to the ancient Greeks. The general run of ancestral spirits may be divided into two classes: the spirit of the chief, who is worshipped by all his subjects, and the spirit of the head of each family, "who may be compared with the Roman Lar Familiaris, since he is worshipped inside the hut at the hearth." In most cases the ancestral spirits of chiefs inhabit the thicket where their bodies were laid to rest; worship is paid to them at the burying-ground. The only way in which the spirit of an ancestor can communicate and warn his worshippers is in dreams or by meeting some person, inspiring him, and making him rave. Sometimes they become permanently reincarnated in the bodies of possessed women. "They demand food and beer as their due from the villagers, asking it in the name of the chief they represent, and curiously enough using archaic forms of speech, when asking for tobacco and beer." When, without any special warning, an ancestral spirit appears to a man in a dream, it is a sign that he has been neglected. The burial-sacrifices held in his honor must be renewed; if the dreamer neglects the warning, he is sure to fall ill.¹³ Though the Nigerian head-hunters do not worship the ancestor, nevertheless his ghost is much feared.¹⁴

Among the Buryat of Siberia only distinguished persons are venerated after death.¹⁵ It is to China and Japan that one looks for a highly developed system of ancestor-worship. The Chinese type has been described by a well-known authority¹⁶ as a calculated process for getting wealth, work, power, and all worldly success through the help of the ghost of the deceased. So ingrained is the custom that the bones of Chinese who die in America are disinterred, to be shipped back to China as their final resting place; then a new ancestral tablet will be added to the sanctuary of the house, before which the family members will worship.¹⁷ Ancestor-worship of the Chinese type is unknown among the Palaungs, but sometimes prayers are said to the spirits of dead parents to invoke their spiritual aid.¹⁸ Japanese Shintoism, or the belief in the "Way of the Gods," is the worship of the gods from whom the emperors claim descent—the worship of the "imperial ancestors." The Imperial House, even of the present time, is supposed to include the direct descendants of the ancient goddess, the first deity recognized in Japanese religion. To pay homage to the gods or to the departed ancestors of the Imperial family is the most important precept of Shintoism, though ancestor-worship on a lesser scale is practised by all families, in the hope of being protected from any evil or misfortune and of attaining health and prosperity. With ancestor-worship goes the desire for offspring and, in default of such, the custom of adoption. The principal object of the latter is to prevent the extinction of families and the consequent neglect of the spirits of the departed. An interesting case occurred when the famous general, Count Nogi, took his own life at the moment of national grief at the Mikado's death, for his two sons had been killed in war and he himself did not believe in adoption, even going so far as to provide by will that his distinguished family should become extinct for lack of an heir. This blow to ancestor-worship was later rectified by the Imperial appointment of a man to the countship, so as to revive the famous warrior's family. It is asserted that the future of Japan must depend upon the maintenance of a new religion of loyalty evolved, through an older type, from the ancient cult of the dead. Certain it is that the conception of ancestor-worship cannot keep its compactness against changing conditions in modern Japan. There are many forces working against it: "the fact that modern civilization is driving people away from the birthplaces of their own ancestors is certainly weakening the conception of ancestor-worship in that it deprives them of opportunities for observing the religious rites towards departed spirits. Again, the atmosphere of a city, exciting and unpoetically scientific, does not tend to cherish the somewhat ghostly and shadowy sense of ancestor-worship." Those who move to a foreign country, for instance to America, are especially inclined to forget past ages and departed spirits. "Furthermore, the main families in the old patriarchal system are already dying out in present Japan, and a branch family cannot be expected to be so devotional to the thought of the ancestors." The modern tendency of individualism does not encourage the idea of reverence for the ancients, and when, in this materialistic age, the ancestral spirits cannot reveal their worldly action in the lives of the people, bestowing on them physical prosperity and peace, modern minds—more or less touched by science and the evolutionary theory—will recognize them only through a sense of emotional feeling, which emotional

18 Milne, *Eastern Clan*, 356.

and imaginative faculty is not possessed by all.¹⁹ To the extent to which these modifications of ancestor-worship are actual, we have an illustration of one of our major contentions: that the maintenance-mores are basic and that as the conditions of life change, the other groups of mores must also change, to be brought again into adaptation.

The doctrine which has the strongest influence on the minds of the Sumatrans is that which leads them to venerate, almost to the point of worshipping, the tombs and manes of their deceased ancestors. They are attached to them as to life itself, and to oblige them to remove from the neighborhood of their ancestral tombs is like tearing up a tree by the roots; they call upon their ancestors when taking solemn oath and apostrophize them in times of sudden calamity.²⁰ On the island of Nias the cult of ancestors develops whenever a man dies leaving one or more sons, for through the manipulation of the priest the spirit of the deceased is induced to enter an idol which henceforth remains in the house of the sons, bringing them blessings, and to it they sacrifice.²¹ Ancestors' spirits, think the Filipinos, care for their good as a sort of intercessor-class with the great god. To these, their real Lares and Penates, they consecrate great feasts. They believe their ancestral spirits live in such places as large trees, isolated rocks, or in anything distinguished from the ordinary, and never pass such features of the landscape without asking permission, inclining, and joining the hands.²² Among some Maori tribes, a woman's father, grandfather, or a priest would attend her during the period of parturition, playing upon a flute made from a bone of an ancestor of the woman or her husband until the child was born. "Such a flute was looked upon as a connecting link, or medium, between the living on the one hand, and their defunct elders and ancestors, as also the gods, on the other. As most gods of the Maori are ancestral deities, deified ancestors and spirit gods that care for, cherish, warn, admonish, and also punish, their living descendants in this world, the mediumistic idea and its advantages are fairly clear."²³

Although the Egyptians did not make much of family and descent, ancestor-worship was not unknown to them.²⁴ Originally the Fravashis, or guardian-angels, in the religion of the Parsees represented only the departed souls of ancestors, comparable to the Pitaras, "fathers," of the Brahmans and the Manes of the Romans.²⁵ In all Græco-Roman societies, the state, the clan, and the family found their ideal and firmest bond in reverence for divine or heroic ancestors, a reverent piety toward the spirits who had passed into the unseen world.²⁶ "The worship of dead ancestors was certainly one of the earliest forms of the domestic rites, because the most spontaneous and simple, and it was favored also by modes of sepulture in the lowest civilization."²⁷ In Rome the sacrifice to the dead, in the shape of the *sacra*, adopted the form of a moral law under the protection of the Pontifices. The obligation could be enforced by the chief authority, and with the death of the one bound to fulfil it, it fell to the heir as a burden on the inheritance. *Nulla hereditas sine sacris* is a well-known maxim in the *jus pontificium*.²⁸ The *lares* were the deified souls of the

dead, the apotheosized spirits of ancestors conceived of as remaining in the house and worshipped by rites performed by the descendants. Wherever there was a domestic hearth or center of life which formed a family, in palace or hovel, *lares* were present as sanctifying spirits, as beneficent *genii* of the house. They identified themselves with the family where they lived, shared its joys and sorrows, its prosperity and misfortune. At the hearth of every house was the *lar familiaris*, associated with Vesta and the *di penates*. The latter were conceived of as many divinities under one point of view; any god, that is to say, could be among the *di penates* in any house. *Penates* were all divinities like Silvanus or Fortuna which were called in inscriptions "domestic," conservative of the house and property, distinguished by the name of the family (Fortuna Flavia), or retained as special protectors of the believer. They guarded stores and watched over the material prosperity of the household. They were abstract *genii* tutelary of the house as the public *penates* were *genii* tutelary of the state. *Penates* were arbiters of luck: they sent misfortune or punishment; they received thanks for escape from accident or for success in some enterprise. In time the *lares* and *penates* became equal and were associated. The *genius* of the head of the house (the term at first signified the generative principle and when applied to women was denominated *Juno*; later it was thought of as the divine personality of mortal men) was worshipped with the *penates* and the *lar familiaris*. The gods, ancestral or otherwise, were always brought into public and private life. In everyday affairs there was constant reference to the gods: at every meal the *lar familiaris* was in evidence; at all departures and returns there were salutations to the household divinities, who were also present at all stages of house- and field-labors. They were invoked at every meeting, advised of all acts of administration and war; every incident called for prayer or thanksgiving, while on public tables were recorded all state religious acts and their occasions.²⁹

§240. Hero-Worship.

THERE are numerous instances both past and present of the deification of the great man, who is often a culture-hero. In many mythologies the first man created all things; he is elevated to the status of a god, and chiefs and kings often descend from him.¹ As in the Bantu cult of ancestors one member is especially favored, so the great hero of the Hottentots is none other than the spirit of an earlier chieftain endowed with special power.² A hero in the making is to be seen in a Kaffir ruler in South Africa who, a Christian advised by missionaries, became a benevolent despot. He conducted church-services twice every Sunday, insisting upon observance of the Sabbath; decreed and actually enforced prohibition of the manufacture and use of alcoholic beverages; put an end to witch-doctors; ate the forbidden totem-animal. He was consequently highly revered, being regarded as a sort of father.³ The Siberians and Mongolians have had their hero-gods besides Genghis Khan, some of them being of supposed supernatural birth; indeed, extraordinary persons have regularly been sent to earth upon special occasions to serve the human race.⁴

The Chinese god of war is nothing but a canonized hero, identified clearly enough with an historical character.⁵ A local divinity at the mouth of the Ganges, one whose name is a spell against tigers, represents the deification of some noted tiger-killer of several generations ago.⁶ Mortals deified as heroes and not as ancestors have played some part in the evolution of the Toda religion.⁷ Some of the degraded classes of India comfort themselves in their present depressed condition by expecting Kalki to appear as their future deliverer and as the restorer of their social position. "Indeed it is a remarkable fact that a belief in a coming Redeemer seems to exist in all religions, not excepting Buddhism and Muhammadanism."⁸

The founder of the republican settlement of Chinese in Borneo was called "big uncle Lo" or "old uncle Lo." The people were fully persuaded that their welfare and luck depended wholly on Lo, that their prosperity waited upon his support and protection. "Anger his spirit," they reasoned, "and it is all up with your luck; act, on the contrary, always in his spirit and follow in the footsteps he traced, and never will he withdraw from you his protection."⁹ Different types of hero appear in the Hawaiian romance of Laieikawai: (a) the hero may be a human being of high rank and of unusual power either of strength, skill, wit, or craft; (b) he may be a demigod of supernatural power, half human, half divine; (c) he may be born in the shape of a beast, bird, fish, or other object, with or without the power to take human form or monstrous size; (d) he may bear some relation to the sun, moon, or stars, a form rare in Hawaii, but which, when it does occur, is treated objectively rather than allegorically; (e) he may be a god, without human kinship, either one of the "departmental gods" who rule over the forces of nature, or of the hostile spirits who inhabited the islands before they were occupied by the present race; (f) he may be a mere ordinary man who by means of one of these supernatural helpers has achieved success.¹⁰ There is a remarkable modern instance among the Maoris of this tendency to exalt tribal and national heroes to the rank of gods. Te Kooti, the famous warrior who led his wild Hauhaus from 1868 to 1871, continually chased by the Government forces but never captured, is regarded as little short of a god by the Urewera people. "For three years he fought your Government troops," they will tell you, "and yet you never got him. He was a wonderful man, and he had *mana-tapu* and influence with the gods. Indeed he was a god himself."¹¹

The nearest approach that the Tlinkits of Alaska ever made to worshipping any object was their reverence for their dead shaman. "They prayed to him for long life and success in their enterprises. In the morning they would take a mouthful of water, spit it out and pray. When in danger of drowning they would pray to him for deliverance. Not only would they thus pray to him, but to things that once belonged to him."¹² The brother of the culture-hero of the Sauk is held to be master of the ghost-world situated in the west beyond the setting sun, while the culture-hero himself is said to be at the north, in the region of snow and ice. "The Sauk are looking for his return, when they believe the world will come to an end, and they and the culture-hero will go to join his brother."¹³ The chief god-hero of the Algonquian family was usually

identified as a fabulous great rabbit bearing some relation to the sun. "He it was who created the world by magic power, peopled it with game and the other animals, taught his favorite people the arts of the chase, and gave them corn and beans. But this deity was distinguished more for his magical powers and his ability to overcome opposition by trickery, deception, and falsehood than for benevolent qualities."¹⁴ The culture-hero and demigod Kulóskap the Master, the "Lord of Beasts and Men," taught hunting and fishing, the uses of animals, the names and tales of the stars, and other important things; he is called the deceiver, not because he befools or injures man, but because he is clever enough to lead his enemies astray, the highest possible virtue to the early American mind.

Kulóskap got his name
Which means the Liar, or,
As Indians mean the word:
A wise and crafty man.¹⁵

The individual who came into the village to open the torture-ceremonies of the Mandans is interpreted by observers as representing the Mandan Adam.¹⁶ The Cheyennes had many culture-heroes and also a story of creation, which latter, however, appears to show Christian influence. It is to the effect that the Creator made man from a rib from his own right side; "and then from the left side of the man he took a rib, from which he created the woman."¹⁷ The Pawnee hero-stories of Grinnell¹⁸ are well known. Mooney¹⁹ says that among the roving tribes of the north the hero-god is hardly more than an expert magician, frequently degraded to the level of a common trickster who, after ridding the world of giants and monsters and teaching his people a few simple arts, retires to the upper world to rest and smoke until some urgent necessity again requires his presence below. "In the south the myth takes more poetic form and the hero becomes a person of dignified presence, a father and teacher of his children, a very Christ, worthy of all love and reverence, who gathers together the wandering nomads and leads them to their destined country, where he instructs them in agriculture, house-building, and the art of government, regulates authorities, and inculcates peaceful modes of life. Such was Quetzalcoatl of the Aztecs, and such in all essential respects was the culture-god of the more southern semi-civilized races. Curiously enough, this god, at once a Moses and a Messiah, is usually described as a white man with a flowing beard. . . . The belief in the coming of a Messiah who should restore them to their original happy condition was well-nigh universal among the American tribes." So remarkable was the reign of Quetzalcoatl that myths grew about him and as the "Plumed Serpent" he was made into a god. He disappeared into legend until the archaeologists of today traced his origin to its source. His virtues had been so extraordinary as to merit for him in popular estimation a second life on earth. There is some ground for the contention that when the natives saw Cortez land from strange ships, very close to the spot where, according to an embellished myth, Quetzalcoatl had launched his fabulous serpent-raft, they regarded him as the reincarnation of the "Plumed Serpent." Thus was his

conquest made easy.²⁰ The Yucatecs ascribed their progress to Zamna who, like Thoth of the Egyptians, was regarded as the inventor of hieroglyphics and the first to teach the people to give names to men and to things.²¹

In antiquity "the awe-inspiring kinsman or tyrant, the birth shrouded in secrecy, the rearing in a lower class and the wonderful elevation, are common features, whether the hero be . . . Romulus or Siegfried, Sargon or Cyrus."²² An ancient culture-hero of the Persians taught the people to make garments of skins and to domesticate animals; he led in hunting by the aid of leopards and falcons, and made the subjugated devils teach his people writing. A prophet of the tribe of Zoroaster was held to have been supernaturally born of a virgin; it was believed that he would arise and help bring about the resurrection.²³ Zoroaster was to return at the end of time.²⁴ In the period of Greek art to which we owe most of the grave-reliefs found at Athens, hero-worship was submerged; it was an era of rationalism and the funeral-monuments of that time tended to represent this life rather than the next. Nowhere in Attic grave-reliefs of the fifth century are the dead so exalted, but once the age of reason was past, hero-worship re-emerged, apparently, in greater force than before.²⁵ The serpent was often not merely the symbol but even the representative of the deceased; it "appears everywhere as the symbol of the heroes, as well as of the chthonian cult-beings in general, and frequently enough the latter make their appearance directly in the serpent form." The serpent along with the torch is the chief symbol of the mysterious; this is true of the Eleusinian, the Dionysian, and other secret cults.²⁶ Another species of apotheosis, the deification of a living person, though contrary to common sense and to sound Roman tradition, was in the end almost universally adopted. "The sullen resistance of public opinion was overcome when the religions of Asia vanquished the masses of the population. These religions propagated in Italy dogmas which tended to raise the monarchs above the level of mankind, and if they won the favor of the Cæsars, and particularly of those who aspired to absolute power, it is because they supplied a dogmatic justification of their despotism. In place of the old principle of popular sovereignty was substituted a reasoned faith in supernatural influence."²⁷ In the North, Odin was at once god, hero, bard, lawgiver, and shaman. He took possession of land, building a temple and beginning the offerings; the people gave him tribute that he might defend the land from their enemies and sacrifice for a good crop. Property-rights and agriculture thus proceeded from the gods. Odin ordered three sacrifices annually, for productive soil and for victory. According to tradition he became ill of a fatal disease and caused himself to be pierced with a spear; thereafter to "mark one's self for Odin" meant not to die a natural death but to be smitten with a spear and win a soldier's end. The Swedes thought he had gone back to Asgard, the original home of the nation, north of the Black Sea. Often when at war they fancied that he appeared, giving some victory and calling others home to him in Valhalla.²⁸ The relation between the Valkyrs and the heroes was a romantic one: "The hero is speedily seized by love of his protectress; she, on her side, although she sees that only by retaining

her maidenhood may she be worthy to be the All-Father's messenger, sacrifices all for her love" and is reduced to a weak earthly woman.²⁹

§241. Types of Daimon.

THE principle of local worship—the deification or spiritualization of rivers, mountain-tops, crags and weird places, vegetation, and the forces of nature—has been very widely held. Though the animistic basis is generally to be inferred, pure abstractions are encountered. Says Gomme:¹ "Earth deities, claiming their sacrifice of human blood; tree deities, claiming the life of their priest; corn deities, whose death forms part of their own cult; rain deities, claiming victims for their service, form no part of any recognizable tribal cult, but are essentially the fixed heritage of the places where they originated and fructified."

By the side of ancestor-worship and belief in ghosts there exist throughout New Guinea undeniable traces of nature-worship. Natural forces are venerated: some tribes regard fire as a kind of divinity, others so revere thunder, lightning, wind, and rain. According to certain Papuans, lightning is caused by evil spirits which dwell in the air, and the storm follows as a consequence of struggle between these ærial spirits. Thunder they dislike and close their ears in order not to hear it. Volcanoes, mountains, and the sea are regarded as abodes of invisible spirits.² When a person dies, think the Akamba, his spirit goes to live in a wild fig tree.³

The daimons of Chukchee belief fall into three classes which are characterized by a good deal of anthropomorphism: (a) invisible spirits, bringing disease and death; (b) bloodthirsty cannibal spirits, the particular enemies of Chukchee warriors; (c) spirits which assist the shaman during his performances. As all these have an especial fondness for the human liver, "this belief is the origin of the Chukchee custom of opening a corpse to discover from the liver which spirit has killed the deceased." The third class, the shamanistic spirits, sometimes called "separate voices," take the forms of animals, plants, or icebergs, and can change their form very quickly—also their temper; "on account of this last peculiarity the shaman must be very punctilious in keeping his compact with them."⁴ According to tradition, when the Oraon of India settled in their present habitat, the land was cleared and occupied by groups of brothers or cousins. "Ceremonies were held by these groups to propitiate the disturbed spirits, and each sept today thus holds its land and has its own group of spirits, to which, at annual gatherings of the members, offerings are made. Part of the forest-land was set aside for the general spirits, the ritual for whom is in the hands of the village priest. The Oraon have a well-developed ceremonial life, some of the rites relating to agriculture, others to the tribal hunts, etc."⁵ In one of the Hindu myths it is related: "I did not fall to earth, for eight elementary spirits encompassed me and with their arms caught me in the air."⁶ One class of divinities or spirits in the Rîg Veda includes abstractions, such as Infinity, Piety, Abundance.⁷ More elemental are the beliefs in China where the human soul is the original form of all beings of a higher

order; "its worship is therefore the basis of all religion in that country."⁸ It would seem that the daimons, like human beings, do not like rivals: some years ago the Christian mission at Tien Tsin was forced to move because it was believed to interfere with the good luck of the place, so that none of the students worshipping at the Confucian temple next door had been able to take degrees.⁹ The religion of the Ainos of Yezo is a primitive nature-worship. "The gods are invisible, formless conceptions, known as *kamui*, such as the house god, the god of fire, and the deities of mountain, forest, sea, and river. The sun and moon occupy a subordinate position among them. There are no priests nor temples, but within every house there is one corner sacred to the house-god. The god of fire, who is esteemed highest of all, is worshiped at the fire-place in the middle of the room."¹⁰

Before drinking of the waters in a new country, the Kayans of Borneo take a knife in their teeth, immerse themselves in the stream, and mutter their petitions to the spirits. Hiller¹¹ once witnessed such a scene, which he describes as follows: "The Bukit went down into the first tiny brook, divested himself of all clothing, took an ear-ring from his ear, threw it into the water and then offered the following prayer to the water-nymphs: 'O spirit of the waters, I make you this offering to show you that your children do not forget you; protect me, I pray you, keep me from harm in the country I am about to traverse, keep me from sickness, from poison and death in the land of your waters; bring me back in safety to my own country!' He had wound a chaplet of sweet-scented leaves about his brow; he was naked, and as he stooped there in the running waters of the stream, lifting the first handful of water to his lips, it was hard to realize that it was only Laioh, the Bukit, and not some faun." Many nature-spirits are recognized by the Malays,¹² while the natives of Ceylon have personified all misfortunes and troubles, of which they have their full share: sickness, hunger, danger from fire and water, and all other evils which hang over mankind.¹³ In the Caroline Islands, every village, every valley, hill, or stream has its *genius loci*, every family its household-god, every clan its presiding spirit, every tribe its tutelary deity. "Thunder, lightning, rain, storm, wind, fishing, planting, war, festival, harvest, famine, birth, disease, death, all these events and phenomena have their supernatural patron or Master-spirit. The gloomy fancy of the Ponapean peoples the swamp, the reef, the mountain, and the hanging woods of the inland wilderness with hosts of spirits, some beneficent, the greater part malignant. All these Ani [deified ancestors] are honoured under the guise of some special bird, fish, or tree in which they are supposed to reside, and with which they are identified."¹⁴

The Tlinkit give ample proof in their actions of a belief in nature-spirits. In earlier times they used to grasp at shadows cast by the sun and would ask, after blowing on their hands, "Let me have luck." The wind was talked to for the purpose of inducing it to moderate or cease; sometimes a piece of fish was thrown to it. When in the neighborhood of a glacier or big iceberg the Tlinkit always talked to it, saying, "My son's daughter, be very careful. You might come down on us."¹⁵ The Cheyenne Indians believed in a being known as Hoimaha, who brought the winter. "When Hoimaha came in winter,

and it snowed, and it was thought that too much snow was likely to fall, the people used to be called together and to have a feast. Then they filled the pipe, offered it to Hoimaha, calling him 'Father,' and 'Grandfather above,' and prayed to him, asking him to stop the snow from falling." When the thunder began in spring, they used to fill the pipe, offer a smoke to the thunder, and ask him to take pity on them. A certain species of butterfly was called the thunder-parasite; the belief seemed to be that when the Thunderbird shakes himself in anger, his parasites fall from him.¹⁶ The morning-star is the principal god and protecting genius of the Cora, being characterized as a brother, a youth armed with bow and arrow who once shot the powerful sun at noon-time on account of his intense heat. "The moon is also a god—both man and woman—and there are many others, as everything is believed to be animate and powerful."¹⁷ The Conoy worshipped corn and fire.¹⁸ In the Tusayan ritual ancestor-worship has developed into an elaborate system of minor supernaturals called *katchinas* that are most powerful to bring blessings; the term in their vocabulary also signifies rain. The names of these beings are legion, their ceremonials complicated.¹⁹

Certain South American Indians, who go to the rivers to seek gold only when they want to purchase some special thing not procurable except with money, if they extract more gold than they actually want, throw the surplus back into the river. "Nothing will persuade them to sell or barter it, for they say that if they borrow more than they really need, the river-god will not lend them any more."²⁰ The Indians of Guiana believe in a number of distinctly anthropomorphic nature-spirits. In this class are the spirits of the forest which can be recognized, even when invisible, by the whistling sound they make; it is like the sound made by a human being, beginning in a high key and dying slowly and gradually away in a low one. Sometimes, however, instead of a whistle they may indicate their presence by a noise somewhat like the neighing of a horse—this in places where horses are known not to exist. Such spirits, like human beings, can be fooled, at least some of the time: "If an Indian loses his way in the forest, the Spirit is the cause. The Caribs, however, know how to circumvent the latter, by making a string puzzle, which is left on the pathway: the object of this puzzle consists in removing, without cutting or breaking, an endless string from off two sticks upon which it has been placed. The Spirit coming along sees the puzzle, starts examining it, and tries to get the string off: indeed, so engrossed with it does he become, that he forgets all about the wanderer, who is now free to find the road again." The Spirits of the Forest are "blessed, or cursed, with strong patriarchal tendencies, are very fond of women, and of human flesh generally. They have an unconquerable attraction toward suckling babes and pregnant women, a statement which appears to be confirmed in the accompanying legends." Like the spirits of the forest, the water-spirits have strong sexual predilections. "Every night, in their anthropomorphic form, both males and females may come after Indians of the opposite sex, respectively, and no disastrous result follows the intimacy. But the Indians who happen to have such dealings must keep the fact absolutely secret: if divulged, either they will not live long, or they will never be visited again by their Spirit friends." These Indians have their special explanation for a lunar eclipse. Island Caribs attribute eclipses to the devil, who tries to

kill Sun and Moon; "they say that this wicked seducer cuts their hair by surprise, and makes them drink the blood of a child, and that, when they are totally eclipsed, it is because the Stars, being no longer warmed by the Sun's rays and light, are very ill." Some Orinoco tribes held that at an eclipse the moon was about to die; others that it was angry with them and would give them no more light; still others held to the death-theory and were under the conviction that if the moon were indeed to die, all exposed fires would be extinguished. "Their women, crying and yelling—an outburst in which the men joined—accordingly would each seize a glowing ember and hide it, either in the sand or underground. Moved by their tears and entreaties, the Moon however recovers, and the hidden fires are extinguished: but were he indeed to die, the concealed embers would remain alight." The Rio Negro Indians, believing at an eclipse that the moon is being killed, make all the noise they can to frighten the evil slayer away.²¹ The moon, known as the wife of the sun, was the only beneficent deity of the Araucanians. She protected and advised them of any disaster, showing them their enemies, and frightening away the evil spirits. "This is easily understood when one remembers that night attacks are seldom undertaken on moonlight nights, and that most savages have a great fear of the dark when alone. It also accounts for the faith placed in the signs of the moon, whose phases were always consulted in their principal undertakings. A red moon was considered to be a sign of the death of some important personage. What is curious, especially if we consider their contact with the Incas, is that the sun has no place in their religious beliefs."²²

When an Athenian was about to be married he is said to have prayed and sacrificed to the Tritopatores, that is, fathers in the third degree, forefathers, ancestors, ghosts, and, according to some, winds. To the winds were offered such expiatory sacrifices as were due to the spirits of the underworld. "The idea that the Tritopatores were winds as well as ghosts was never lost." They were sometimes called "lords of the winds" and "gate-keepers and guardians of the winds." It was held that the winds gave life not only to plants but to all things. "It was natural enough that the winds should be divided into demons beneficent and maleficent, as it depends where you live whether a wind from a particular quarter will do you good or ill."²³ Among the Romans there were no signs of the worship of nature or of personified natural phenomena. There was no worship of stars, sun, moon, or storm, and in the early ages there were no abstractions, though later talents, traits, and other qualities were personified and made into gods.²⁴ To primitive Semites the action of the wind in fructifying date-palms seemed divine work; indeed, the winds are cherubim.²⁵ In the Book of Enoch of the Apocryphal period, the sea, hoar frost, snow, mist, dew, and rain each has its special spirit. This idea is still further developed in the Book of Jubilees; the different elements are represented as each containing a spirit which, in turn, has its angel, so that it becomes possible to speak of the angels of the fire-spirit or the wind-spirit. Later, abstract conceptions had their angels bound up with them, as the angel of death, the angel of peace.²⁶ Originally the belief in angels was everywhere tied up with the notion of elementary spirits; those which, according to ancient folk-belief,

were active in the phenomena of the heavens, in storm and wind, thunder, lightning, and hail, in field and wood, in fountains and trees, in plants and animals—in short, everywhere, but especially where something extraordinary and inexplicable occurred—these spirits became angels to the Jewish people.²⁷ There is plenty of evidence that the Old Testament notion of angels was borrowed largely from Babylonia. The seven archangels go back in the last analysis to the seven Babylonian planetary gods, the twelve angels of the zodiac to the twelve zodiac gods of Babylonia, and the twenty-four presbyters of the Apocalypse of John to the twenty-four divine judges of the Babylonians.²⁸ There is no uniform conception of angels, whose number is legion: some are angels over natural phenomena, as winds, fire, and waters; they form God's court, his ministers and reporters of what goes on on earth. Angels have intercourse with the daughters of men; they eat, bear weapons, and ride horses; an angel brought food and drink to Elijah, while another slew 185,000 Assyrians. They are media of God's will and execute his dispensations; when the mission is not punitive, they are beneficial to man.²⁹

Finnish mythology invented unlimited classes of wicked spirits and demons for all kinds of misfortunes and trouble, finding in them an explanation of the aleatory element. "In epic poetry we find that a more human form is given to the influences dispersed throughout the world, where they opposed and strove to destroy the work of the gods and propitious geni. In this case, the wicked principle was personified by the giant Hiisi, who had a wife and children, horses, dogs, cats, and servants, all hideous and wicked like himself; in one word, the complete household of the chief of a tribe." Hiisi, scouring the plains on his horse, while his bird precedes him in the air, seems to have been originally a personification of the icy and fatal north wind. "The Finns considered him as one of the most terrible demons, just as the Accadians feared the personification of the west wind, which produced by its excessive heat in their country quite as fatal effects."³⁰

§243. Fear of the Daimons.

THOUGH the Melanesians have not attained to the advanced conception of a devil, they nevertheless have a firm belief in evil spirits¹ and, as in the New Hebrides, ascribe all calamity to the fact that the spirits have not been satisfied.² Nothing comes easier than death to the Papuan, when once his mind is fixed upon it; especially is this the case when he conceives that an evil spirit is interfering with his affairs. "The Papuan collapses before this illusion as quietly and certainly as we should sleep under the influence of a strong narcotic."³ Although there is no cult of a superior intelligence nor any attempt to enter into personal relation with spirits, there is a sturdy belief among the Southern Massim in the existence of a large number of mythical beings. "Most of these unite malevolent qualities with a bodily form or mental attitude

which approach those of man sufficiently closely to permit of these creatures being characterised as ogres. The folk tales abound in examples of such ogres." The Koita believe also in a number of mythical beings with various external characteristics, all more or less malicious. "The most important of these, called *tabu*, inhabit definite areas, and in some instances at least have spheres of influence to which their power is limited. The places they inhabit are discovered by the occurrence of sickness or death after camping, eating, sitting, or urinating in these areas. The bites of insects, and accidental wounds received in such localities, are thought to produce especially severe and intractable sores."⁴

The African Bagobo is less concerned with good than with evil spirits, so far as the routine of daily life is involved. Countless pains and miseries come to him through the direct manipulation of evil spirits called *buso*, who, in all events, must be propitiated with offerings, tricked by subterfuges, or banished by magical rites. "These evil beings, some anthropomorphic, some zoomorphic, dominate the Bagobo's attitude toward life and death, and keep him constantly on the watch lest he be out-manœuvred, and thus become a prey to bodily suffering. Disease may also be caused by magical means, or because of the transgression of some custom or taboo, and to forestall such evil the behavior of the Bagobo is checked or redirected by rigid prohibitions at many points."⁵ Among both West Africans and Bantu, though the firmament is the great indifferent and neglected god, he has great power if he would exert it. It is the lesser spirits or daimons which take up most of one's thought, but when things go very badly with him the African will rise up and call upon this great god in terror maddened by despair, that he may hear and restrain the evil workings of these lesser devils.⁶ In the Congo region it is held that evil spirits or *mingoli* dwell everywhere, and are ever ready to pounce on any living person, and either carry their captive away, fasten a disease upon him, or kill him; "their life is one long drawn out fear of what the *mingoli* may next do to them, and their religion is a series of ceremonies, by *nganga* [shamans] and charm, to control, circumvent, and perhaps conquer the *mingoli*. Fortunately, these *mingoli* are limited in the area of their operations, and can be deceived. The *nganga* can cork them up in their calabashes, can cover them with saucepans, and when necessary, if the fee is large enough, can kill them, or rather, destroy them."⁷ The Akamba call *Aiimu* the evil spirits which are supposed to be the disembodied relics of people who have killed their neighbors by the help of black magic; they have been banished by the Supreme Being to the woods, where they wander about without anybody to sacrifice to them. "They are a vindictive crew and enter into people who are working in distant fields and cause them to become seized with a kind of madness; persons so affected return to their villages, moan, groan, and roll about and the *Aiimu* speak through the mouth of the possessed person and perhaps say they want a *Ngoma*, a drumming feast, performed in their honour. The people of the village then collect in a hut, the possessed one sits in the center, the people make a drumming close by the patient for some hours and they kill a goat in the hut, if it is considered a serious case they may even kill a bullock close outside the door of the hut. Pieces of meat from each of the legs of the sacrifice are then placed close to the patient and after a little the *Aiimu* leave the person and

⁷ Weeks, in JAI, XL, 370.

he or she recovers."⁸ Although the Nandi love their cattle more than anything else on earth, yet there are cases when their dread of the malignant supernatural overpowers this affection; for instance, "if one of their cattle is noticed to protrude its tongue to an excessive distance, or if a cow, as it is driven along, gets its tail twisted round a sapling by the road side, they are killed, for both of these instances are believed to be portents of great impending evil which can only be averted by the death of the animal."⁹ In the relations of the black to his totem or divinity there rules a single bond, that of fear; if he does not obey orders, he will be punished. "This is true, so much so that if perchance, as sometimes happens, a negro changes tribes—is, for example, surrendered to another tribe as ransom for a murder—his first totem will become a thing of complete indifference to him. He will trouble himself about it in no way and without scruple will yield to the white man, who wants to buy it, the image representative of his former totem, to which he was but so lately so attached. It has become for him a thing without value, while the totem of his new tribe has become his all. There is therefore between the black and his totem no 'respect' [as Frazer says], but simply 'cult,' and a cult founded on fear."¹⁰

Monier-Williams¹¹ has asserted that the great majority of the inhabitants of India are, from the cradle to the burning-ground, victims of a form of disease which is best expressed by the term demonophobia. This dread of evil spirits haunts Hindus of all ranks and stations, from the highest to the lowest, with the exception of those fortunate persons whom a European education has delivered from the dominion of such ideas. "In fact, a belief in every kind of demoniacal influence has always been from the earliest times an essential ingredient in Hindu religious thought. The idea probably had its origin in the supposed peopling of the air by spiritual beings—the personifications or companions of storm and tempest. Certainly no one who has ever been brought into close contact with the Hindus in their own country can doubt the fact that the worship of at least ninety per cent of the people of India in the present day is a worship of fear. Not that the existence of good deities, presided over by one Supreme Being, is doubted; but that these deities are believed to be too absolutely good to need propitiation. . . . The simple truth is that evil of all kinds, difficulties, dangers, and disasters, famines, diseases, pestilences, and death, are thought by an ordinary Hindu to proceed from demons, or, more properly speaking, from devils, and from devils alone. These malignant beings are held, as we have seen, to possess varying degrees of rank, power, and malevolence. Some aim at destroying the entire world, and threaten the sovereignty of the gods themselves. Some delight in killing men, women, and children, out of a mere thirst for human blood. Some take a mere mischievous pleasure in tormenting, or revel in the infliction of sickness, injury, and misfortune. All make it their business to mar or impede the progress of good works and useful undertakings." It is probable that in surrounding the god Rudra-Civa with armies of demons and impish attendants and making his sons lead and control them, Hindu mythologists merely gave expression to an idea inveterate in the Indian mind, that all disease, destruction, and dissolution are the result of demoniacal agency. People are often possessed by evil spirits, called seizers; these are Skanda's demons, and are both male and

⁸ Hobley, *A-Kamba*, 89.

⁹ Hobley, in *JAI*, XXXIII, 342.

¹⁰ Trilles, *Fân*, 28.

¹¹ *Brâhmanism*, 79, 210, 230, 231.

female. "Until one reaches the age of 16, he is liable to be possessed by one group of 'seizers,' who must be worshipped in proper form that their wrath may be averted. Others menace mortals from the age of 16 to 70. After that only the fever-demon is to be feared. Imps of this sort are of three kinds. One kind indulge only in mischievous sport; another kind lead one to gluttony; the third kind are devoted to lust. . . . When they seize a person, he goes mad. They are to be kept at bay by self-restraint and moderation."¹²

Many gods and spirits, each with power to give prosperity and success or to inflict sickness and calamity, dwelt in the Angami hills; to these the people sacrificed cows, domesticated and wild, dogs, cocks, and liquor.¹³ Sometimes fear of spirits takes the place of prudence and knowledge, as among the hill tribes of India where fear of the wood-spirits has prevented reckless waste of forests, for the natives believe that it offends the spirits of the woods to cut down trees unnecessarily.¹⁴ Palaungs, Shans, and Burmans describe in their folk-tales a race of ogres with supernatural powers—a tall, dark-complexioned, curly-haired race, voracious in eating animal flesh in a half-cooked or raw condition, and preferring human flesh when obtainable. "It is by many supposed that these tales arose out of reminiscences of a Negrito race of cannibals, who inhabited the more northerly parts of the country and fought against the incoming tribes."¹⁵ In Funchow, China, there were five idols called the Five Emperors who were the agents of the "Big White Devil" and the "Little Black Devil"; when cholera broke out there in 1858, processions were arranged for these images.¹⁶

The rampant demonolatry of the Tibetans seems to have developed the doctrine of tutelary deities far beyond what is found even in the latest phase of Indian Buddhism. "Even the purest of the Lamaist sects—the Ge-lug-pa—are thorough-paced devil-worshippers, and value Buddhism chiefly because it gives them the whip-hand over the devils which everywhere vex humanity with disease and disaster, and whose ferocity weighs heavily upon all. The purest Ge-lug-pa Lama on awaking every morning, and before venturing outside his room, fortifies himself against assault by the demons first of all by assuming the spiritual guise of his fearful tutelary, the king of the demons. . . . The Lama, by uttering certain *mantras* culled from the legendary sayings of Buddha in the Mahayana Tantras, coerces this demon-king into investing the Lama's person with his own awful aspect. Thus when the Lama emerges from his room in the morning, and wherever he travels during the day, he presents spiritually the appearance of the demon-king, and the smaller malignant demons, his would-be assailants, ever on the outlook to harm humanity, being deluded into the belief that the Lama is indeed their own vindictive king, they flee from his presence, leaving the Lama unharmed."¹⁷

A book could be filled with particulars of demonolatry as accepted by the natives of the Maldives. "Every accident, every illness, every misfortune is ascribed to the devil. No one goes out after dark if he can help it, for fear of meeting the devil in the streets."¹⁸ "Any unusual noise or motion in the jungle, anything which suggests to the Dyak mind an invisible operation, is thought to be the presence of an antu, unseen by human eyes, but full of mighty power. He is mostly invisible, but often vouchsafes a manifestation of himself, and

when he does so, he is neither a graceful fairy, nor a grinning Satyr, but a good honest ghost of flesh and blood, a monster human being about three times the size of a man, with rough shaggy hair, glaring eyes as big as saucers, and huge glittering teeth." Bad and angry spirits are far more numerous in Dyak belief than good ones, and are regarded with dire dread.¹⁹ When pestilence threatens in Sumatra, sickness-idols are carved out of blocks of wood and erected in the village.²⁰ "In expiation of certain sins," think the aborigines of Formosa, "the spirits are doomed to roam through the air, being thereby peculiarly irritated and inclining to malignity; wherefore it behooves all to propitiate and avoid them."²¹ In New Zealand even the fairies—white-skinned, golden-haired, pretty creatures—were dreaded, as sometimes they would carry mortals off.²²

Each Eskimo is supposed to be attended by a special guardian "who is malignant in character, ever ready to seize upon the least occasion to work harm upon the individual whom it accompanies. As this is an evil spirit, its good offices and assistance can be obtained by propitiation only." The spirit is often materialized in the shape of a doll. "If the spirit prove stubborn and reluctant to grant the needed assistance, the person sometimes becomes angry with it and inflicts a serious chastisement upon it, deprives it of food, or strips it of its garments, until after a time it proves less refractory and yields obedience to its master." It is possible to pass such a spirit over to another person if the latter does not perceive what is being done. All the objects of nature, too, have guardian spirits which are malignant. They are all under a great spirit who "is nothing more or less than death, which ever seeks to torment and harass the lives of people that their spirits may go to dwell with him."²³ In the Arctic fall, when there are heavy storms and the air is full of noise from the crashing ice, the spirits are abroad, including one the sight of which kills the dogs with convulsions. All the spirits of evil are roused to bring death and destruction. Sedna, goddess of hell, rises from the ground, to seize the spirits of the dead.²⁴ Similar beliefs appear among the Labrador Indians who are "terribly superstitious, and everything not understood is attributed to the working of one of the numerous spirits. . . . The rule seems to be that all spirits are by nature bad, and must be propitiated to secure their favor."²⁵ The preposterous stories illustrative of belief in medicine-men's tales show in what sort of an intellectual atmosphere the Ten'a of central Alaska live. To them spirits have a sort of aërial body, something intermediate between body and soul, and are called by terms meaning "evil things," "swifts," or "quick-movers." They "are essentially malignant, and their sole purpose is to do harm." Even when they assist men, it is by doing harm to the enemies of the helped. Strictly speaking, they do not even help, for men have power to command them.²⁶

The Iroquois believed in a variety of demons known as False Faces—simply heads, made terrific with large eyes and long hair—that brought pestilence.²⁷ The full ceremonies of the Midé' lodges, which the more southern Ojibwa translate as "grand medicine," were performed twice a year, in the fall and in the spring. "Those in the spring were of a rejoicing character, to welcome

the return of the good spirits; those in the fall were in lamentation for the departure of the beneficent and the arrival of the maleficent spirits."²⁸ In connection with many ceremonials the *ko'yemshi* "gods" of the Zuñi visit from house to house to collect food. "Were they refused, 'something would happen,' something 'bad' even if you refused them merely 'in your mind.' A house was pointed out to me," writes Parsons,²⁹ "which they had on one occasion approached only to be locked out. The woman had nothing at hand, but her refusal was particularly flagrant because she was one the *ko'yemshi* had called *an tsita*, 'the mother,' having worked for her and her household during the year. In less time than the *ko'yemshi* needed to return to the pueblo,—the house in question was a little outlying,—a child in the house was burned, burned so badly that next day it died. In one of the most distinguished families in Zuñi there are two men blind of one eye. The middle-aged of the two . . . lost his eye as a result of smallpox; the elderly man, a medicine-man in the *ne'wekwe* fraternity, lost his in an accident from a horse. But both are supposed to have suffered for criticisms made by them against the *ko'yemshi*."

While the Tarahumari Indians have very slight beards and pull out any hair that appears, their devil has a full beard.³⁰ In the daimonism of the Indians of British Guiana a special rôle is played by Kanaima, who appears not only as an evil, invisible, demoniacal being but also in many cases as an individual personality—the personification of human vindictiveness, the author and originator of all evil, the revenger of known or unknown offenses.³¹ These Indians know also of various beings consisting of spirits residing in fabulous animal bodies. "Perhaps the nature of these beings is best made clear by saying that they correspond very closely to the dragons, unicorns, and griffins, and to the horned, hooved, and tailed devils of our own folk-lore." Of this kind is the "ornar," a being with a body said sometimes to be like that of a gigantic fish, sometimes like that of a huge crab, at other times to be of various other forms, which lives under water, especially in rapids and cataracts.³² The Caribs say their water-spirit is like a camudi snake, but much bigger; it lives in underground water; in habitat it corresponds closely to the variety of water-spirit of the Warraus. "In cases of snake-bite among certain tribes, in addition to any other treatment the bitten person must neither drink water, bathe, nor come into the neighborhood of water, during the period immediately following the accident. The same prohibition, for a similar period, is incumbent on his children, his parents, and his brothers and sisters so long as they reside in the same settlement. His wife alone is free from the taboo. The freedom of the woman from such an inconvenience is interesting when regarded in conjunction with the belief in human milk as an efficacious antidote for snake-poison." Each tribe seems to exhibit variations in the ideas held as to the form, shape, and peculiarities assumed by its respective bush-spirits. "Having no bows and arrows, these Spirits are accustomed to fight only with their limbs, so that when an Indian has been attacked and returns home, where he is sure to die shortly after, no marks will be found on his body." Sometimes the spirits will not even allow a victim to return alive, but will eat him, causing him to disappear totally. The old-time Arawak people used to call them by a term which literally means "bows-broken," and when returning home from some hunting or trading expedition, would sing out that name before reaching

their houses, with the view to preventing them from making an entry. "Special words, or paraphrases, have to be used under particular circumstances; thus, in traveling over water—river or sea—the use of certain names otherwise employed in ordinary every-day conversation, is absolutely forbidden." To point the finger at a spirit must necessarily be a serious matter; many natives believe that if an individual points at certain rocks a heavy storm will immediately overtake him for his audacity. When an explorer once questioned some Indians about certain rocks that had a curious, vitrified appearance, he was at once silenced by the assertion that any allusion to their appearance would vex these rocks and cause them to send misfortune.³³ According to the Tucana Indians, discovered in the Amazon basin a few years ago, the Devil-Devil was an evil spirit who lived in the jungle, in swampy pools and thunderstorms. This evil spirit, called Jurupary, manifested himself in the failure of crops, tropical storms, and other violent workings of nature. If a crop failed the people said, "The Jurupary is after us."³⁴

The world of spirits was to the ancients just as little organized as the peoples themselves. "All the spirits, even the highest, are but mighty magicians, mighty through their magic, sometimes beneficent according to their fancy or caprice, but always feared."³⁵ The conception of evil spirits often represented them as taking the form of some strange and fearful animal, like the leopard with wings and a human head of the Egyptians and Phœnicians, the snake in Persia and Assyria, or the jinns of the northern Semites—hairy beings, nocturnal monsters, haunting desolate places with jackals and other animals which shun the abode of man.³⁶ Harmful daimons are almost unrepresented in Homer.³⁷ In Chaldean and Babylonian mythology evil spirits played a remarkable rôle.³⁸ Demonology was highly developed among the ancient Hebrews, with a host of divine adversaries under the command of Satan, one of the sons of God. The evil spirits are enemies of mankind; they are everywhere present: in every case of misfortune, of sickness and death, of human sin and wickedness are they active. They lie in wait for man during his entire life and for his soul after death.³⁹ Especially in the Apocryphal period was there an elaborate doctrine of demons, usually spoken of as the disembodied spirits of the giants, who were the progeny of the fallen angels and the daughters of men, and were to carry on their work of moral ruin upon the earth unpunished till the final judgment. In the Septuagint the heathen gods are uniformly depicted as demons.⁴⁰ "There is no use to try to disguise the fact that in the mind of Jesus, as revealed in the Synoptic Gospels, Satan and his legions occupied just as important a place and played as prominent a rôle as in the mental outlook of other Jews of that age, and of believers in every age precedent to our own."⁴¹ All the names of strange gods became names of

demons to the Jews, and the Christians followed them in this view. In the early Christian era it was held that "the efforts of demons and unclean spirits are to lay waste God's kingdom and harm men. In this purpose they have by apparent miracles and oracles infused in people the fancy that they are gods and have thus created heathendom with its mythology and cult. They are the origin of magic, necromancy, haruspices, the science of augury and astrology. Besides they do harm in every possible manner. Yet the Christian need not fear their attack because the devil and his demons must live rather in continual fear of the Christian. For the Christian can not only drive them out everywhere, but can also force them to tell their names and to acknowledge that they are not gods, though they are worshipped [as heathen gods] in temples."⁴² There arose a doctrine of a satanic empire in rivalry with the celestial, a doctrine that daily met with wider acceptance. The evil spirits may be the weaker side and suffer defeat, but they go about enlisting wicked men and seek thereby to replenish their host; compacts are made with the devil, who aids his confederates even during their earthly life, a notion quite prevalent during the Middle Ages.⁴³

To some people, despite the advance of rationalism, the devil is still very real. In a competition among Russian children for the best short story, the Moscow Soviet Commissariat for Education specified that the tales must be devoid of all elements of superstition, and must contain no mention of angels, fairies, or evil geniuses.⁴⁴ Yet survivals are frequently enough reported in the daily press, as in the case where a child died from the effects of malnutrition yet was believed by his parents to have been the victim of a spell, for they claimed that they had been troubled with an evil spirit haunting the house; or in the story of a panic that occurred in one of the public schools in consequence of a statement made by a little girl that she had seen the devil coming into the building.⁴⁵ Along with other superstitions, belief in the devil is hard to down.

§244. The Familiar Spirit and Dualism.

THE personification of the aleatory element in its favorable aspect, among the Queensland aborigines, is Mulkari, the supernatural power which makes everything the natives cannot otherwise account for: he is a good, beneficent person and never kills anyone.¹ A personal familiar spirit in Australia is the animal by which each sorcerer works.² When an African Bageshu child is old enough to sit up unsupported, it is named after one of its father's ancestors; "the ghost of the person whose name has been adopted is supposed to take charge of the child." Should the child be illegitimate, the ghost will kill it. "In cases where a woman has been unfaithful, she gives the child another name secretly, and asks the ghost of the ancestor of the real father to protect it from the other ghost of her husband's ancestor. If a child is sickly after being named, the parents consult the medicine man, who tells them the reason and prescribes for it. If he ascribes the illness to the guardian ghost, they change the child's

name and call upon the new guardian ghost to protect the child."³ The natives of the Cameroons believe in both good and bad spirits and in a primitive sort of dualism. "The dualistic schism which permeates the whole physical and moral world—light and darkness, day and night, birth and death, love and hate, truth and falsehood, right and wrong—extends through the consciousness of these people. Among more advanced groups it has developed into the concepts of god and the devil with their different qualities and attributes, heaven and hell, blessedness and perdition; with these childlike people it signifies simply: good spirits and bad spirits."⁴

As the sun and moon are deities to the Tungus, so are the stars alive and have, indeed, an astrological significance. "Each man has his star as a guardian spirit which influences his fate. Through the different positions of the stars it is known at birth what fate the gods have predestined for man, and in general the belief is held that the destiny of men is under the sway of heaven. This power, however, is no free agency, but is as immutable as the course of the stars themselves."⁵ In the Manchu calendar the place in the house where the spirit of luck abides is specified for each day in the year.⁶ Guardian spirits of industry form a part of Japanese belief: "Whatever his occupation might be, some god presided over it; whatever tools he might use, they had to be used in such manner as tradition prescribed for all admitted to the craft-cult. It was necessary that the carpenter should so perform his work as to honour the deity of carpenters,—that the smith should fulfil his daily task so as to honour the god of the bellows,—that the farmer should never fail in respect to the earth-god, and the food-god, and the scare-crow god, and the spirits of the trees about his habitation."⁷ In the war of the gods and demons, as pictured in Hindu myths, we have the eternal struggle between good and evil. The demons had been gaining on the gods when Brahma told the latter how to make a drink which would render them immortal. A truce was made with the demons, who were to help and also share in the product. It was to be made by churning up all things in the sea, the churn-dasher being a mountain and the king of snakes lending himself as a rope to turn it, the gods pulling one end and the demons the other. When the process was complete the goddess of good luck, Sri, came out of the mountain with a cup of this drink, but the gods took it all. This angered the demons who recommenced the war but were now beaten and had to flee into the ocean.⁸ At the funeral-rites of some of the wild tribes of southeast India there is a crude dramatization of this struggle: "The corpse is placed on a car to which ropes are attached in front and rear, and the persons attending the ceremony are divided into two equal bodies, who set to work to pull the car in opposite directions. The front party of men represent the good spirits, those in the rear are the evil powers. The contest is so arranged that the former becomes victorious."⁹ Among the Nagas the *aghau* is a personal familiar, potentially possessed by all persons though its existence is not always apparent. The idea of fate or destiny is very often attached to *aghau*, but one also hears of it as a spirit inclined to be malignant, and in some aspects it appears almost as a soul; the *aghau* is also a house-spirit. "When a man migrates he scatters bits of meat on the ground behind him to induce his *aghau* to go with him, telling it that no one else will cherish it and

feed it. A friend of the writer's has a dozen *aghau*, though he rarely sees them. Six are like apes and six like human beings. They belong to the family and attach themselves to the richest member of it,"¹⁰ the one most favored by luck. A certain Sakai, who had inherited his familiar spirit from his father, a Malay-speaking Selangor aboriginal, proceeded to call upon it in Malay,¹¹ which was logical enough, though not imputing much linguistic ability to a supernatural being. The significance of the tutelary gods in the daily life of the natives of Nukúoro is very great, as almost every single act of life requires their influence, which must be sought through the medium of the priest. "Upon the occasion of building a house or a canoe, at marriage and confinement, in sickness and at death must the gods be called upon, and in most of these cases those in need turn to their special protecting deities."¹²

The Hawaiians have a very vivid belief in animal-helpers, half divine, half human; they utter their counsels through the lips of mediums who become for the moment possessed with their spirits. Such gods are called *aumakua*. "They are bound by obedience to their devotee, who becomes their keeper, and their worship, and consequent service, extends to his family and is handed down from generation to generation." This notion is illustrative of many aspects of the topic under review. Any creature, plant, or object may become an *aumakua*. The shark, cowrie-shell, limpet, squid, and eel are famous sea-*aumakua*. The mud-hen, plover, chicken, wild-goose, frigate-bird, and some song birds are important *aumakua*, while among insects the spider, among reptiles the lizard, and of quadrupeds the pig, dog, and rat are worshipped. "Rocks, too, are often set up as *aumakua* and worshiped as transformed deities. Certain trees, sweet-scented flowers and phenomena of nature and the elements, the volcano, for example, are powerful *aumakua*." On the coast, sharks are the particular object selected for veneration, and each several locality along the coast has its special patron-shark whose name, history, place of abode, and appearance are well known to all. Each of these sharks has its keeper who is responsible for its care and worship. "The office of *Kahu* was hereditary in a particular family and was handed down from parent to child for many generations, or until the family became extinct." The shark-gods are invoked with particular prayers and have temples erected for their worship. "Their special function is to aid in the food supply of the household—generally by giving the fisherman good luck at sea—and to protect him from drowning. They are, in fact, regarded as spirits of half-human beings which, rendered strong by prayer and sacrifice, take up their abode in some shark body and act as supernatural counselors to their kin, who accordingly honor them as household divinities." In most cases these animal-helpers have the power to take either human or animal shape. Some are friendly spirits, others evil: those which, like the shark and limpet, calm the waves or provide food for their patron, are beneficent; others, like the dreaded worm and the lizard, are much to be feared. "The dog is beneficent, but a great thief. The pig is a mischief-maker, symbol of lechery and filth. The rat is, like the owl, beneficent, from the classic tale of the rat-god who, when *Makalii* (Little Eyes—the Pleiades) tied up all the food of mankind in a net and hung it in the heavens, gnawed the ropes and let it tumble back again to earth." Sorcerers can use their spirit-helpers to transmit disease to others. When the *aumakua* comes into

¹⁰ Hutton, *Sema Nagas*, 193.

¹¹ Evans, in JAI, XLVIII, 187.

¹² Kubary, *Nukúoro*, 27-28.

a home where illness or other trouble is present, it enters the body of some member of the family—by the head if friendly, by the feet if ill-disposed. The person falls asleep, the *aumakua* taking the place of the spirit thus ejected. If a friendly spirit, it offers advice as to how to escape the illness or other troubles—what prayers to offer, fish to catch, herbs to gather. To test the *aumakua*, a member of the family throws a wreath of some special plant about the neck of the person possessed. "If it is a friendly spirit, he will take it, if an evil spirit, he will spit, glare, tear his clothing, or even plunge naked into the bushes. Such insanity is relieved by a drink made from a coarse kind of grass. To keep out these evil spirits, house and yard are sprinkled with water to which salt and a bit of root similar to the ginger are added. This ceremony is also used in case of death." The presence of a spirit, as has been stated, is indicated by a divine possession in which the person possessed speaks not as he is accustomed but in the character and with the words of the spirit whose medium he is. "In order that the *aumakua* may be strong enough to act his part as helper, he must receive offerings of prayer, and of sacrifice in the shape of food and drink called 'feeding the spirit.' For example, a woman living near *Kealakekua* was seen each night to carry a pail from her house to the cliff and empty it over into the sea. It was found that the pail contained *awa* drink [the intoxicant of the Hawaiians] which was being fed to the household *aumakua*." The idea of the *aumakua* in the Hawaiian theogony seems to be that of enforced helpfulness within a kinship-group as a means to ensure superhuman coöperation in individual affairs. Although worshipped like a god, the *aumakua* belong to a group of lesser deities, a sort of servant class, because bound to obey those whom they serve. They may be compared with the Arabian jinns whose supernatural assistance is forced through the possession of some special talisman. In the Hawaiian case the talisman seems to be the social fact of kinship, the act of invocation perhaps serving as a charm to enforce service. Various phases of the notion of fetishism are also present here, and a species of personification of the aleatory element.¹³

"Like most other religions that of the Eskimo recognized two principles, a good and a bad, as ruling the world." The evil spirit is female, the maternal grandmother, mother, or wife of the good spirit. There is also the world's creator: "from him one could, through the *angakok*, seek help and advice in bad luck and danger." If one has been a good man, *i.e.*, diligent in working, one can go to him after death and be happy.¹⁴ Some of the American Indians believed in *oyaron* or tutelaries. "The person whose life was regarded as being under the protection of some being embodied in a material thing, in this occult manner, had less reason for apprehension than he whose life was so protected by some particular animal, for should the animal die, it was a foregone conclusion that he himself incurred the risk of a like fate. This belief was so strong that many seemingly proved its truth by dying soon after the known death of the tutelary animal." In addition to the tutelaries belonging to every person, there were *oyaron* common to the family, the gens, the clan, and probably the tribe, which were located in the lodge, where sacrifices and offerings were made to them.¹⁵ Among the gods or demi-gods of the Aboaki are those who particularly preside over the making of petroglyphs. "They lived in caves by the shore and were never seen, but manifested their existence by in-

15 Hewitt, in HAI, II, 179.

scriptions on the rocks."¹⁶ The Algonquian tribes had some notion of dualism, later reinforced by Christianity, while the Warraus of British Guiana held to a belief in one good spirit and many evil ones. The former was the author of creation, the source of all good fortune; the evil spirits were the enemies of mankind, the causes of sickness and every privation, who gloated over people's misfortunes and found joy in the sufferings of mortals.¹⁷

Nagualism, a belief of the Indians of Mexico and Central America, connects the life and welfare of man with animals and birds. We abstract an extended treatment of this creed.¹⁸ The term "nagual" comes from the stem "to know" or "to recognize" (one's fate or destiny). A description of the rites as they existed in 1530, in Honduras, runs as follows: "The devil appeared to the natives in the form of some animal, to which they apply the name *Naguales*, meaning guardian or companion. 'When such an animal dies, so does the Indian to whom it was assigned.' For the formation of such an alliance, the Indian retired to some quiet spot, and there appealing to Nature, implored for himself the favors conferred on his ancestors. He sacrificed a dog or fowl, drew blood from his own body, and then slept. When dreaming and half awake an animal would appear to him, saying: 'On such a day go hunting and the first animal or bird you see will be my form, and I shall remain your companion and *Nagual* for all time.' Without a *Nagual* the natives believe no one can be rich and powerful. . . . The Aztecs had a belief in the protecting power of a personal guardian spirit or tutelary genius, and held that it was connected with the day on which each person was born. This was called the *tonalli* of a person, meaning that which is peculiar to him,—that which makes his individuality, his self. . . . The real purpose of the conjuring and incantations practiced by the native doctors when visiting the sick was to force or persuade the guardian spirit or *tonal* to return. The ceremony bore the name 'the restitution of the *tonal*,' and was deeply connected with superstitions of Nagualism. . . . In Mexico today, at New Year or at corn-planting the head of a family will go to the parish church and among the various saints there displayed will select one as his guardian for the year. This is in addition to his special personal guardian. . . . Every person at birth has a good or bad genius assigned to him. 'The good genius is known by the Nahuatl term *tonale*, and it is represented in the first bird or animal of any kind which is seen in or near the house immediately after the birth of the infant.'" The sorcerer having invoked the demon in behalf of a young child, "the *nagual* of the child would appear under the form of an animal or object set opposite its birthday in the calendar, a serpent were it born on the second of January, a flower were it on the thirteenth, fire were it on the twenty-fourth, and so on. The sorcerer then addressed certain prayers to the *nagual* to protect the little one, and told the mother to take it daily to the same spot, where its *nagual* would appear to it, and would finally accompany it through all its life."

Nagualism had its recognized centers of association, its secret councils, and its imposing ceremonies. It had high priests, teachers, practitioners, and brotherhoods—the latter dedicated to Iscariot or Pilate, to the Devil or the Antichrist, in derision and hatred of the Christian priests and teaching. Women often held high posts in the system which became after the conquest a potent factor in political and social development. "Expert Nagualists claimed power

¹⁶ Mallory, in BAE, X, 32.

¹⁷ Tylor, in JAI, XXI, 285; Schomburgk, *Brit.-Guiana*, 170.

¹⁸ Brinton, *Nagualism*, 5, 11 ff., 23, 28, 30, 40, 46 ff., 55, note, 60; Brinton, *Americanist*, 171, 172.

to transform themselves into a globe or ball of fire, and to handle fire or blow it from the mouth was common with them." Fire was the most important Nagual symbol, the primal element and the immediate source of life. The Tree, another symbol of the ancient cult, is still venerated among the present population. "When the change from the individual into his or her *nagual* was about to take place, it was required that the person be absolutely naked." The change could be prevented by throwing salt on the person. "The fury of many naked Nagualists, meeting at night in caves and dancing before their idols was a scene that greatly roused the Spanish missionaries. . . . Missionaries in Mexico saw a horrible caricature of this holy rite [selection of a patron saint] in the selection by the Indian priest of the *nagual* of a child. Their consternation was even greater when they saw that the pagan priest also performed a kind of baptismal sacrament with water and that the *tonal* by which the individual demon was denoted was the sign of the cross." Here is a whole cult built about the idea of the familiar spirit. There exist elsewhere in the world many cases of a similar though less organized relation between men and animals or even plants.¹⁹

The notions of the familiar spirit and of dualism were well known to the ancients. In the religion of Zoroaster, the Fravishis—literally, they who cherish, foster, or nourish—were the simple essences of all things, the celestial creatures corresponding with the terrestrial of which they were the immortal types. "Stars, animals, men, angels themselves, in one word every created being, had his Fravishi, who was invoked in prayers and sacrifices, and was the invisible protector who watched untiringly over the being to whom he was attached."²⁰ This notion led naturally to that of dualism wherein these protecting genii, created by Ormuzd, struggle against evil with an energy which is the more efficacious as their associates have displayed more virtue and purity during earthly existence. On a larger scale, whatever good thing Ormuzd—the principle of good, the guardian of mankind—creates, Ahriman corrupts and ruins. "Moral and physical evils are alike at his disposal. He blasts the earth with barrenness, or makes it produce thorns, thistles, and poisonous plants; his are the earthquake, the storm, the plague of hail, the thunderbolt; he causes disease and death, sweeps off a nation's flocks and herds by murrain, or depopulates a continent by pestilence; ferocious wild beasts, serpents, toads, mice, hornets, mosquitoes, are his creation; he invented and introduced into the world the sins of witchcraft, murder, unbelief, cannibalism, sodomy; he excites wars and tumults, stirs up the bad against the good, and labours by every possible expedient to make vice triumph over virtue."²¹ The irreconcilable struggle between the powers of good and evil is the old myth of the struggle between light and darkness, fertility and barrenness, life and death, in a more ethical form. This dualistic view of life develops easily into a belief in a heaven and a hell, with punishment meted out in the latter place to the evil, inclusive of the unbelievers.²² In the same way that every man, according to the Avesta, had his Fravishi, so also, according to the Accadian magical tablets, every one from the hour of his birth had a special god attached to him, who lived in him as his protector and his spiritual type. The god attending upon each man

22 Tiele, *Gchte. Relig.*, II, 88, 160-162; Maspero, *Hist. Anc.*, III, 582.

was of peculiar character, partaking of human nature, its imperfections and its foibles. Like the man to whom he was united, he could be conquered by demons or by spells and become their servant. When Namtar, the plague personified as a goddess, seized upon an individual, his god as well as his body was at the mercy of the spirit of the disease.²³ The familiar spirit in Babylonia and Assyria was in a measure identified with one's better self.²⁴ Images were brought into the house as protecting gods against evil spirits, while the exorcism of sickness often ended with the wish: "May the evil demon go out and get off to one side; may the good demon, the merciful guardian spirit, remain fast in his (the sick person's) body."²⁵

Familiar spirits are common enough in the Old Testament.²⁶ The Jews believed that each and every man had a protecting angel, which notion, says Bousset,²⁷ was affected by the old belief in ghosts. "The guardian angel of each man was originally nothing other than that part of man which remained over after death, as a ghost, and as such—a wondrous, often malicious, kind of being—was surrounded with religious reverence. Out of this notion grew the remarkable idea of a celestial double, a second higher self, which is not man himself and yet is indissolubly united with him." The belief in guardian angels of all individuals was expanded into the idea of guardian angels for whole groups. Among the Greeks, the Demeter of Eleusis remained the particular deity of the Eumolpidæ and the Athene of the Acropolis belonged to the family of the Butadæ; so also, the Politii of Rome had a Hercules, the Nautii a Minerva, the Julii a Venus. "When the deity of a family had acquired considerable reputation and, from the prosperity of his worshippers, was judged to be both benevolent and powerful, then it often happened that a whole city wished to adopt it and by diligent service win its favor."²⁸ Belief in fate-determining powers was well established among all Slavs before the introduction of Christianity. The poetical-religious issue of their belief in fate is *sreća*, from the standpoint of theology the most remarkable form of South Slavic folk-belief. *Sreća* is no mythical creature inherited from primitive times; rather is it, as formerly with the Roman Fortuna, a composite creation. This familiar spirit is closely allied with the luck element.²⁹ The Valkyrs were the personal attendants of heroes. If one of these maidens of Odin abandoned a man, since she had had charge of his luck, his luck and life came to an end.³⁰

§245. Deities.

THE mores of a people are reflected in the character and actions of their gods, as among the Dobuans of Papua, one of whose deities is called the god of the thief, "whom he watches only, but does not protect, as anyone caught stealing food or property from one who is not a stranger or enemy may be killed by the owner of the food or property without fear of revenge being taken."¹ The gods have the same passions as men and must submit to similar social regulation, as witness the reason given for the drought in 1918 by the Africans of Lango. "To the north-east of the Lango is the river Moroto, and in March of

this year a man fell from the sky near this river, bringing with him a bag of money, a leg of a cow and four soldiers. He is black, and speaks Lango without any foreign accent, and states that though he comes from a place where there are cattle innumerable and wealth unspendable he will consent to live on the earth. Orweny of Batta, a powerful wizard, asked him about the drought, as he would be sure to have the latest information, and the heavenly visitant informed him that it was due to the fact that a certain *jok* (god) had committed adultery with the wife of another *jok* and refused to pay compensation, and that, therefore, in his wrath, the latter had stopped the rain. Orweny by his enchantments secured the arrest of the former and the payment of compensation towards the end of May. Hence the June rains."² If the gods were not involved in sexual difficulties with other deities, they were likely to get into similar complications with mortals, for they were an amorous lot, indeed rather promiscuous. Where relations of the sexes are institutionalized, the gods often display a looser morality than men. "Brought within the circle of proprietary ideas, a god must not encroach upon the property of others. His priest's property is of course his. His priest is in fact only his trustee. He has therefore an easily admitted claim on his priest's wife. Marriage with the priest is tantamount to marriage with the god. And yet, in many cases of this quasi-polyandry, it is difficult to tell to what extent the priest is the god's proxy, or which, priest or god, is the paramount husband." So also in ritualistic defecoration and impregnation, and in the very general submission of women to sacred men, the god works through proxies. "Practically just as secular prostitution is somewhat of a guarantee against adultery, so the religious prostitute or the priestess-wife precluded undesired encroachments of deity upon other women."³

Primitive peoples are interested in those gods only who are concerned with the everyday affairs of men; exalted, remote deities are of no importance to them. The gods of the Bagobo may be grouped in two classes: (a) gods of exalted rank who live in the nine heavens above. "They are felt to be remote from human affairs and neither help nor harm is expected from them, hence no devotions are addressed to them. These spirits occupy an important place in the mythical songs and romances which the people delight to tell, but the interest is purely of a literary sort, and it is probable that these divinities are of foreign origin." (b) In intimate relation to the daily life are many unseen beings who have charge of the physical world; who act as divine protectors and helpers of man; who direct industries; who stimulate men to fight; and who, in their several departments, receive the prayers and gifts of the people.⁴ Some of the West Africans believe in a great god—a creator, a god who has made all things, and who now no longer takes any interest in the things he has created. Their name for him is a compound of "spirit" and "good." He leases the government of affairs to a viceroy or minister, called Mbui, who "has never been, nor can he ever become, a man, i.e., be born as a man, but he can transfuse with his own personality that of human beings, and also the souls of all those things we white men regard as inanimate. . . . The M'pongwe know that his residence is in the sea, and some of them have seen him as an old white man, not flesh-color white, but chalk white. Mbui's appearance in bodily form denotes ill luck, not death to the seer, but severe and diffused misfor-

² Driberg, in JAI, XLIX, 70.

⁴ Cole, in AA, XX, 217-219.

tune. The ruin of a trading enterprise, the destruction of a village or family, are put down to Mbuiri's action. Yet he is not regarded as a malevolent god, or devil, but as an avenger, or punisher of sin; and the M'pongwe look on him as the Being to whom they primarily owe the good things and fortunes of this life, and as the Being who alone has power to govern the host of truly malevolent spirits that exist in nature. The different instruments with which he works in the shaping of human destiny bear his name when in his employ. When acting by means of water, he is Mbuiri Aningo; when in the weather, Mbuiri Ngali; when in the forests, Mbuiri Ibaka; when in the form of a dwarf, Mbuiri Akkoa. . . . This is the great difference between Mbuiri and the lesser spirits: the lesser spirits cannot incarnate themselves except through extraneous things; Mbuiri can, he can become visible without anything beyond his own will to do so. The other spirits must be in something to become visible. This is an extremely delicate piece of fetish." The authoress⁵ says that apparitions are not always of human soul-origin. Tando, the Hater, chief god of the Northern Tschwis and Ashantees, is terribly malicious, human in shape, and though not quite white, decidedly lighter in complexion than the chief god of the Southern Tschwis. His messengers are the awful driver ants which it is not orthodox to molest in Tando's territories. He uses for weapons lightning, tempest, and disease, the last being the favorite. No trick is too mean or venomous for Tando. Among the Bantu there is a great female god who is more important, in so far as mundane affairs go, than their male god; whereas among the peoples who are called true negroes, the great gods are male. Weeks⁶ speaks of a Congo term which "is the nearest equivalent we can get to God," that conception being "four persons all seemingly equal, and each supreme in his own department."

Of the Baganda it is reported that "the most influential of their gods was *Mukasa*, who seems to have been originally an ancestral spirit, and whose place of origin and principal temple was on the biggest of the Sese Islands. *Mukasa* became in time the Neptune of Uganda, the god of the lake, who was to be propitiated every time a long voyage was undertaken. In former times—in fact, down to the conversion of Mwanga to Christianity—*Mukasa* and some of the other gods were provided with earthly wives. Virgins were set apart to occupy this honourable position, and lived under the same disabilities as the Vestal Virgins, though it is to be feared that their infraction of the rule of chastity was more frequent."⁷ The tribes at the head-waters of the Nile believe in a supreme being who made the world and man, and is too great to care for men. Hence they do not worship him.⁸

That the Koryak conception of one supreme being is not indigenous, or at least not very old, may be judged from the very vague account of his nature and qualities and from the fact that he takes no active part in shaping the affairs of men. "He is, of course, a benevolent anthropomorphic being, an old man with a wife and children, dwelling in the sky. He can send famine or abundance, but seldom uses his power to do either good or evil to men." The abstract names given to him are hardly consistent with the conception—distinctly material, as far as it goes—which the Koryak seem to have of his nature. Ainu tradition informs us that "the gods gather themselves together and consult with one another as to ways and means before they act, the Creator, of

⁵ Kingsley, *Travels W. Afr.*, 228, 229, 521; Kingsley, *W. Afr. Studies*, 423; Henning, in *Globus*, LXXII, 102; §210, above.

course, acting as president, just in the same way as the Ainu chiefs used to meet together for consultation before they acted."⁹ The Mongols are said to have no word for god. They conceive of the blue vault of the sky as solid and attribute omnipotence to it, together with all the qualities which we assign to godhead. All the spirits are subject to it and it is the source of existence for all. They adore sun, moon, stars, mountains, rivers, and all unusual things. It is thought that such ideas may have been borrowed from Buddhism, and that of Fate, also cherished by them, from Lamaism.¹⁰ There is some evidence of sun-worship and of the belief that planets rule fate in India, while it is still a Brahman's daily prayer to say: "Let us meditate on that excellent glory of the Divine Vivifying Sun; may he enlighten our understandings."¹¹ The dawn of the twentieth century was commemorated in Tibet by the introduction of a new god, who makes the five-hundredth so-called god created since the arrival of Confucianism in the land of the Lamas. This new deity is held to be a direct representative of Buddha and is endowed with the power to silence the spells of all other divinities in the Tibetan calendar. The form chosen for him is that of a man with the head of a horned bull. The ox has long been a sacred animal in the Orient and this is considered to be the highest expression of incarnated deity.¹² The Kuki-Lushai clans have promoted some demons into local divinities. The Thados have two spirits unknown to other clans: a female ghost, the sight of which is followed by awful misfortunes unless averted by the immediate sacrifice of a dog, and a spirit which lives underground. Besides these spirits the Lushais believe in the *Lashi*, peculiar beings residing in precipices and controlling wild animals.¹³

There are many hill-deities known in certain localities about Madras, which "are little removed from the spirits of the deceased Saoras." They have no notion of any deity of whom they will ask anything in expectation of the request being answered through love.¹⁴ "A female divinity is invariably found to be the patroness of the Indian robbers and thieves." This was true of the Thugs, "who had raised the profession of robbery by throttling and strangulation, into a semi-religious cult." Many tribes worship the female principle almost exclusively.¹⁵ The typical Toda god is a being of a distinctly anthropomorphic type; in the legends he lives much the same kind of life as the mortal Toda, having his dairies and his buffaloes. "The sacred dairies and the sacred buffaloes of the Todas are still regarded as being in some measure the property of the gods, and the dairymen are looked upon as their priests. The gods hold council and consult with one another just as do the Todas, and they are believed to be swayed by the same motives and to think in the same way as the Todas themselves."¹⁶ The Mahabharata describes the gods as casting no shadow, which recalls Dante's conception, and "without sweat or dust, with fresh chaplets and without blinking," floating in the air. The gods are by no means almighty. They fight and are beaten. Brahmans can conquer them; and they are dependent on sacrifices.¹⁷ A still more remarkable characteristic of a god is that of being half-male, half-female; "it symbolizes both the duality and unity

of the generative act and the production of the universe from the union of two eternal principles."¹⁸

In China, "the sovereigns of the empire stand above the gods even after their death."¹⁹ China has shown her understanding of the close relation between new religious and political development by requiring all the incarnate gods in the Chinese Empire to register in the Colonial Office at Peking. "The Chinese Government, with a paternal solicitude for the welfare of its subjects, forbids the gods on the register to be reborn anywhere but in Tibet. They fear lest the birth of a god in Mongolia should have serious political consequences by stirring the dormant patriotism and warlike spirit of the Mongols, who might rally round an ambitious native deity of royal lineage and seek to win for him, at the point of the sword, a temporal as well as a spiritual kingdom."²⁰ In Japan, "all the dead become gods. . . . It is to be remembered, of course, that the Japanese word for gods, *Kami*, does not imply, any more than did the old Latin term *dii-manes*, ideas like those which have become associated with the modern notion of divinity. The Japanese term might be more closely rendered by some such expression as 'the Superiors,' 'the Higher Ones;' and it was formerly applied to living rulers as well as to deities and ghosts."²¹

Perelaer²² says that "the Dyak is a monotheist. He believes in a single Superior Being who . . . is master of everything and is omnipresent." Though he has a very vague conception of this Being, however, not knowing whether it is male or female, he is sure it had no beginning and will have no end. Some Dyaks have a number of gods among whom the deity of the rice-harvest occupies first place. Again, while priests and chiefs recognize a "high father" as chief god, the ordinary Kayan attends only to his ghosts.²³ On the Island of Nias the cult is restricted to the most indispensable manifestations in that the gods are called upon only when one needs them.²⁴ In Nukúoro two kinds of gods are distinguished: those who arose of themselves and the souls of the dead, the former being in the majority. "The spirits of dead relatives and chiefs of the present generations do not come at all into account and never enjoy divine honor. The few gods of this category are derived out of the migration-periods." In Ponapé, on the other hand, the worship of deified ancestors, coupled with a sort of zoölatry or totemism, is the backbone of the faith.²⁵

The Samoans had many gods, a number of them devoted to war and very often represented as eels.²⁶ On Easter Island the highest god was represented by the eggs of sea-birds, the chief and favorite native food, and received sacrifices of the first fruits of the earth.²⁷ These people had a god of thieving and thought it no harm if not detected; detection indicated that the god disapproved and the thief then must return the goods and submit without resistance to punishment by the owner.²⁸ In Mangaia all the gods are called the children of Vatea, and of these Tane is one. "His name indicates the generative principle in nature, and the word is used to designate a husband, and even a man who is betrothed." He is especially the drum-god and the axe-god; he presides

over the erotic dance as well as over the war-dance.²⁹ The annals of the Sandwich Islands and of the Society and Hervey groups give many a dark record of human sacrifice to propitiate their hideous idols or to appease their wrath. "These gods were generally represented as implacable and vengeful, and the authors of all calamities. The native mind seems never to have entertained the idea of a beneficent and compassionate Being in any of their deities."³⁰ Almost every valley, mountain, stream, or place on Chatham Island is under the influence of one god or another; the natives have little images of these deities. Among the important gods are Tametera, the sun-god, who is the father, and Papa, the earth or mother; from the father comes all that the mother has and she gives it to her children. Another deity is called Whale-flesh; still others are vermin-gods which plague mortals. Ko Matarangi (shadow) comes upon men unexpectedly, to injure them in the dark; Pukuhoni is an unclean spirit which does harm behind the back; Ko Puanga is the Pleiades.³¹ Among the Maoris the cult of Io was very ancient; he was regarded as the origin of all gods. "Only priests of high rank were taught the cult of Io and its rites. No home was sacred enough in which to perform such rites, or even to mention the name of Io, hence all such ceremonial performances took place out in the open and in some isolated spot. In fact, it looks as if Io was looked upon as a creator and supreme being." Yet the Maoris have given up their old cult, for, like primitive peoples generally, they expect service from their gods and are not averse to renunciation of them in favor of others more promising. Best³² has often asked old natives the reason why their fathers gave up the practice of their ancient religion and accepted Christianity. Their answers were prompt and plain: "It was because of the superior powers of the white man's God. A deity whose subjects could acquire written languages, make guns and numberless other wondrous things, must be one worth cultivating; the ignorant Maori people might gain much from him."

The tribes of the New World very generally chose the sun as the object of their adoration; it was sometimes one of the gods, sometimes a symbol or form of the gods, and sometimes the highest god. "The United States Indians regarded the sun as the symbol of light, life, power, and intelligence, and deemed it the impersonation of the Great Spirit. They sang hymns to the sun and made genuflections to it."³³ The Blackfeet Indians in Canada "know and observe the Pleiades, regulating their most important feasts by those stars. They have a sacred feast about the first and last days of the occultation of the Pleiades. The mode of observance is national, the whole tribe turning out for the celebration of its rites; these include two sacred vigils, the solemn blessing and planting of the seed. This opens the agricultural season. The rites are somewhat similar to the Hebrew Passover, and some of the mysteries held by the Ancients in honor of Ceres."³⁴ The Flatheads believed the sun to be the Supreme Being and that after death the good, brave, and generous went to the sun, while the bad remained near the earth and troubled the living; others supposed that the worthless ceased to exist at death.³⁵ Although the sun as a divinity is not represented by them as a malignant being, the worship accorded him is the most dreadful which the Dakotas practise. Aside from the sun-

dance, there is another proof of the divine character ascribed to the sun in the oath taken by some of the Dakotas: "As the sun hears me, this is so."³⁶ With the Arapaho, as with many other tribes, the moon is masculine, and the sun is feminine.³⁷ The New England Indians worshipped the sun as a god and had a festival at harvest time. Laftau³⁸ states that the name of the war-god of the Hurons and Iroquois was but another name for the sun, "who was their Divinity, as he was that of all the Americans." While the Zuni have a plurality of gods, many of whom are the spirits of their ancestors, these are but mediums through which to reach their one great father of all—the sun.³⁹ The Chichimecs of northern Mexico adored the sun as the supreme god and also worshipped lightning, while both Moki and the ancient Mexicans held sun-festivals.⁴⁰

Other deities of the native Americans may be cited to show their anthropomorphic character. The chief god of the Algonquins was depicted as a liar and a cheat;⁴¹ again the ranking divinity was the one who cooked the food dearest to the tribe—deer-meat and mescal hearts.⁴² How the aleatory element has influenced the idea of deity is well brought out in the following comment by Hewitt:⁴³ "While Teharonhiawagon is regarded as the Master of Life, it must not be inferred that he is also the god or ruler of all other things; and it must not be overlooked that all gods as such were themselves subject to the inexorable decrees of Fate, of Destiny. In primitive thought the concept or idea of Fate or Destiny is clearly developed out of the countless failures of the gods to bring about results contrary to the established course of nature; every failure of a god to accomplish a certain expected result was at once attributed to one of two things: either to the conjectured inability of the god to change the decree of Fate, *i.e.*, the established order of things, or to an abortive attempt of the people to perform a rite or ceremony in accordance with a prescribed ritual. These considerations exempted Teharonhiawagon and other gods from censure for the nonperformance of the impossible, and they also show that sometimes the gods stood in need of human aid, either directly or ceremonially." The Menomini divided the universe into two main sections, the upper and lower worlds; these in turn were divided into four parts or tiers each, separated by the earth. Each world had its presiding deity. The upper world, peopled by the beneficent powers, was ruled by the chief god, who had many mythical birds as servants. Since the latter came into actual contact with mankind, while their master remained aloof, they received more homage than the chief god, who really appeared only as a figurehead.⁴⁴

The Mexicans had many gods and goddesses: deities of war, of fire, of the harvest.⁴⁵ In the temple of the war-god was a cage to receive statues of foreign divinities, that they might not be able to help their worshippers.⁴⁶ The chief Mexican god was white and bearded, and came from the east; and others of their gods were of similar appearance: "white, blue-eyed, heavily bearded."⁴⁷ This does not harmonize very well with the following explanation of the black Christ. "Of course, I saw black Christs in Mexico, but there one could trace

their sable origin. When Cortez introduced Christianity into the land of the Aztecs, that swarthy heathen people could not be induced to worship anything white, and consequently the Christus was always represented as dark. Even now in remote places the figure remains of sombre hue, and in two of the chief churches of Mexico City there are still life-sized black Christs. In Europe Sicily is not alone the home of black Christs. Above the high altar in the marble cathedral of Florence at Easter, 1904, hung an enormous black Christ on a crucifix.⁴⁸ Several others are mentioned, with their exact locations. "Probably these black Christs date from Arab times, a sort of compromise between the white and the dark-skinned people, as in the case of Mexico."⁴⁹ The people of Hierro, Canary Islands, prayed only when in trouble; the men had one god, the women another. On conversion to the Catholic faith the islanders gave the names of these two deities to Jesus and Mary respectively.⁴⁹

In Egyptian mythology the soul or double of the gods did not differ at all in nature from the double of men. "The gods were only more refined and powerful men; better prepared to command, enjoy, and suffer than men. They had the same physical constitution, suffered hunger and thirst, had our passions, troubles, joys, and infirmities. A mysterious fluid called *sa* circulated in their members, giving them health and vital vigor. They differed in power according to the quantity of this which they had. They could transmit it to each other and to man. This operation was carried on in the temples; the person to be impregnated knelt before the statue of the god, with his back to it; the hand of the idol was placed on the back of his neck and the fluid passed into him temporarily, and had to be renewed. It was exhausted in the gods by use and they replenished it at a mysterious pool in the southern sky. This fluid caused the bodies of the gods to be preserved far beyond the time of men. Old age hardened their bodies into precious metals; the bones into silver, the flesh into gold, the hair into lapis lazuli. The later alchemists believed in the transmutation of metals as a hastening of this process. Still the Egyptian gods were liable to decrepitude; the sun having become old, his chin wobbled, and the saliva trickled from his mouth. The gods were represented in mummies and their tombs were shown." Death meant for the gods exactly what it meant for men among the Egyptians; the body decayed and the soul faded, unless the same means of preservation were used. They had no joys after death; their souls regretted the light and suffered hunger, and they became ferocious monsters toward men unless propitiated by the necessary offerings to relieve their wants.⁵⁰ The Babylonian god had much the same relation to his people that the deity of the Hebrews exhibits in the Old Testament: he became angry at them and afflicted them, directed their warlike operations, and all the rest.⁵¹ "I think," states Lenormant,⁵² "amongst no people do we find the idea that the gods obtained material sustenance and new strength from the offerings made to them, expressed in more set terms than in the Accadian magical documents." The graves of Babylonian gods were shown.⁵³ In Persia there was a sort of reverse process in god-building: "there is a period where, through the efforts of the theologists, the conception of godhood appears very much purified, where the survivals of the older polytheism are set aside by the transformation of the gods into heroes or into attributes of the single god. When this peak is reached, gradually the abstract characteristics and ac-

tivities of the god are incorporated again in saints, angels, gods, and again do the forms of mythology people the heaven which until then was filled, in its exalted emptiness, solely by the breath of the All-powerful."⁵⁴

It can hardly be said that the Phœnicians borrowed their dwarf-gods from the Egyptians, for such deities are to be found in many ancient religions as the personification of cosmic forces, as earth-gods possessing great skill and working in hidden places. A special Phœnician touch is the image of a dwarf-god embellished on the cabin of each ship as the divine artist and architect.⁵⁵ Androgynous deities were common to Babylonians, Greeks, and other ancients, while traces of such a notion are in evidence in the Old Testament.⁵⁶ Baal was the god of the land, regarded as the bestower of its fruits, and was entitled to thanks accordingly.⁵⁷ Jahweh, the "Most High," had many anthropomorphic qualities: he interceded for his people; he "thundered with a great thunder" and helped them gain victory; he was a warrior in charge of a host and the destroyer of all things.⁵⁸

In Homer the gods need sleep and food as much as any mortal. The Olympian household is full of strife, jealousy, and old grudges. The women in it act like women in French novels: they are clever at female artifices; they cajole and wheedle; they get into scrapes and lie out of them; they carry on intrigues of love and ambition on behalf of their protégés, Greek or Trojan. The men make large allowances for the women, pet them, are angry with them for disobedience and self-will, but have to remember that they are females and make the best of it. Both the allowances and the petting are derogatory to the women; they avail themselves of their privileges and manœuvre to get their own way without penalty. The picture is just about what a group of frivolous French nobles, men and women, living isolated in a château in the middle of the eighteenth century would have presented, including the meanness which such a group would show if their selfishness and vanity were at stake. "In a passage which more nearly resembles a burlesque than any other in the poems, —the conflict of the gods on the plain of Troy,—Athena hits Ares in the neck with a large stone, and overthrows him; Aphrodite then leads him from the battle, but Athena follows the two and with a blow of her 'thick hand' casts both upon the ground. A few verses later, Hera boxes the ears of Artemis, and sends her in tears from the field of battle. In the same episode, Poseidon reminds Apollo that they two were sent down by Zeus to serve Priam's father Laomedon for a year,—that the one built a wall for the city and the other tended flocks, but that at the expiration of their term of service, Laomedon had dismissed them without the pay which had been stipulated, and with the threat to bind them hand and foot, and send them to distant lands to be sold as slaves, or he would lop off their ears for them." Homer knows no divine providence, in the sense of a definite purpose and guidance for the life of a man or for the development of a city or nation. The gods discuss a plan just as men would—by no means seeing the end from the beginning. "In the chariot-race held in honor of the dead Patroclus, Apollo knocks the whip from the hand of Diomed that the advantage may be given to his chief competitor Eumelus, whose horses Apollo himself had tended during his year of service

to Admetus; but Athena sees the trick, restores the whip to Diomed, and breaks the yoke to the chariot of Eumelus,—thus causing him to lose the race. To such pettiness do these great gods descend." The gulf between mortals and immortals, though distinct, is not impassable. Four sharp distinctions are made between men and the higher gods: (a) these are mortal, while those are immortal and ever young; (b) these toil and labor, while the gods "live at ease;" (c) these eat bread and drink wine, while those feast on ambrosia and nectar; and lastly (d) these dwell on earth, while the gods inhabit heaven and Olympus. Of course the power and wisdom of the gods are far greater than those of men but, after all, they are of the same kind, differing chiefly in degree, while in their needs, appetites, and passions the divine is not far removed from the human.⁵⁹

The Greek gods were not always and everywhere the same; Artemis was not always the patroness of virginity and chastity, for there were lascivious rites in her honor.⁶⁰ "The difference between the gods of the old religious ideas and of the newer or Hellenic thought tended to crystallize in the distinction between Chthonian and Olympian gods, though this distinction never became absolute and universal, and there is hardly any deity who belonged everywhere and at all times to the one class and never to the other. But the worship of the dead, i.e., of the heroes, and of the Chthonian gods, was marked off by broad lines from that of the Olympian gods, and most of what was really deep and heartfelt religion in Greece belongs to the former, while most of what is artistic and a permanent possession for the civilized world belongs to the latter. The even numbers and the left hand belonged to the Chthonian deities, the odd numbers and the right hand to the gods of heaven. White was the appropriate colour of the Olympian gods, the East their abode, and the direction to which their temples looked and their worshippers turned when sacrificing to them. The forenoon was the time suitable for their worship. The Chthonian gods preferred blood-red or black; the West was the direction to which their worshippers faced, the afternoon their chosen time. Offerings to the Olympian gods were shared in by men; offerings to the Chthonian gods were burnt whole. Men had community in the sacrifice with the former, with the latter they had none."⁶¹ When it came to a belief that the cosmos was an orderly arrangement, like the state, then the scope of ghost-beliefs, as distinguished from that in a hierarchy of gods, could no longer flourish.⁶²

Worship of the sun and other heavenly bodies was very widespread in antiquity. Lippert⁶³ has made much of it, stating in part that the younger gods, those of the conquerors, are Uranian, while those of the conquered are earthy, ugly, female, and black; there is a resulting antagonism of light and darkness, white and black. The ghosts of men are separated into two groups: the heroes go to heaven or the sun, while the others go to Hades. In Egypt all petty divinities tended to merge into forms of the sun, the one essence.⁶⁴ In Persia, Mithra was the god of light, the defender of truth, and the enemy of the powers of darkness. Like Helios, who sees and hears everything, Mithra was the genius of oaths and agreements, the supervisor and ruler of the world. At first as god of light standing near the sun, Mithra later became identified

with the sun himself. The ancient Persians also had a star-cult, and in the Avesta the starry sky is likened unto the garment with which Ahuramazda was adorned. The noblest star was Sirius, the Dog Star, who was benevolent in that he conquered the demon of barrenness and brought copious rain over the land so that the specter of hunger and of crop-failure had no power.⁶⁵ The sun-cult was very ancient in Babylonia, where Marduk, the chief deity of the Babylonian pantheon, was originally a local sun-deity. He was called the compassionate one, the lord of life. In the Hebrew notion of Jahweh much was borrowed from the sun-cults of other lands, chiefly Egypt and Babylonia. The Old Testament transfers Marduk's heroic deeds to Jahweh, who crushed the heads of the sea-monsters and under whom the helpers of the dragons collapsed.⁶⁶ The sun's horses and chariots and the worship of sun, moon, and stars were borrowed from the Babylonian-Assyrian sun-cult.⁶⁷

A symbol of the sun-god which has continued for many centuries, from heathen times to our own day and in the Christian church, is the wheel. The shining orb of the sun was conceived of as a wheel revolving in heaven, and it was thus that classical and Norse writers spoke of it; this developed into a sun-chariot drawn by horses, lighting up the earth and bringing fruitfulness to both men and fields. Aryan as well as Semitic peoples had this notion in ancient times, and even among the American Indians the wheel was the symbol of the sun. Originally the wheel appeared with four spokes, later with several more, as upon Assyrian monuments. In Scandinavia the symbolic wheel with four spokes appeared in the earlier Stone Age, in the tombs of Denmark and Sweden; the Bronze Age, both in Scandinavia and Germany, as well as in Asia Minor and elsewhere, was rich in objects with four or more spoked wheels. The old Syrian churches, first destroyed by the Mohammedans in the seventh century, had the four-spoked wheel on columns and capitals. It was found also on the old Christian grave-stones in Germany. It is from this symbol that there developed the cross of the Norse; it came to be used as the representation of the Father and Son, even of the dove (the emblem of the Holy Ghost), over whose head the sun-wheel was placed as an aureole.⁶⁸

In the last struggles of paganism with the Christian church, the cult which exercised the most powerful attraction was that of Mithra. Though at first a sun-worship of Persian origin, its early character was greatly altered by syncretism, that is by accretions from other cults, especially Phrygian, and by natural development, to meet the needs of the times. "The worship of the Sun was the central force in Julian's attempt to remedy the dogmatic and moral weakness of paganism. In the fourth century the ancient god of light has become the supreme Power, who is all-seeing, all-pervading, who is the lord and giver of life, the cleanser from sin, the protector of the miserable, the conqueror of evil dæmons and death, who assures to his faithful worshipers the hope of immortality. The monuments of Mithra have been found all over the Roman world, in all the regions of Italy, in Spain, Africa, and all the provinces bordering on the Danube and the Rhine, in Gaul, and in Britain. . . . His worship was conducted in underground grottoes, brilliantly lighted and adorned with symbolic figures. The symbolism of his ritual has exercised and

puzzled the ingenuity of modern archæologists. Probably it conveyed many meanings to the devotee; but the central idea in the end seems to have been that of a Power who conquers the spirits of darkness, leads souls from the underworld, and gives peace by purification. The ritual was complicated and impressive. There was a kind of baptism of neophytes, confirmation, consecration of bread and water, cleansing of the tongue with honey, and other ablutions. The great festival of the god was celebrated on the 25th of December. His mysteries created a powerful bond of union, and in this respect satisfied one of the most urgent needs of society under the later Empire."⁶⁹ There was a revival of sun-worship at a later time; about 1610 the Duke of Alba, while hunting in the mountains near Salamanca, found in a remote valley an unknown people who adored the sun.⁷⁰

§248. Types of Fetishes.

PRACTICALLY any object is thought by the Melanesians to be capable of harboring a spirit, and the objects so possessed have consequently special efficacy through spiritual agency. The effectiveness of the rites of the Banks Islands are held to depend upon the use of certain stones or other objects which possess *mana* or power for some special end, and "this *mana* is definitely associated with a belief in the presence of a *vui* or spirit."¹ In the Mekeo district of British New Guinea some stones are believed to possess a dangerous magical property. Strong² has known a Solomon Islands police-sergeant scatter a whole crowd of Mekeo natives by picking up such a stone and chasing them with it. "On another occasion I was told protests were made against taking such a stone into a boat, on the ground that the boat would surely sink. Why these stones should have this evil property," he adds, "I do not know. They are simply plain ordinary rounded stones." So they may be in appearance, but they are not ordinary stones, not just plain stones, but stones possessing a mysterious power because of an indwelling spirit. In fact, in British New Guinea there are many kinds of stones which have special powers that certainly no ordinary rocks can possibly possess—"stones in and near the houses that had an influence on the life and health and prosperity of the people, sling-stones which had been kept for generations and which gave to others in the bag the power of direction so that they would certainly hit the victim aimed at. At Wedau there is a stone which gives strength and courage for war. From far and near people came to drink water in which chips of it had been boiled. In all the villages there are stones which are revered, and which may not be moved. In the Boianai villages many of them have signs on them, rude circles, chipped concentrically; their presence in the village ensures success to all garden work, a plentiful supply of food, and happiness to the people."³

Stones are not the only things that may be possessed or that exhibit spiritual agency or direct influence on human affairs. In British New Guinea, at the special feasts, the guests bring pigs, which are killed slowly "so that there may be much squealing, which pleases the mango tree, for otherwise crops would fail, and pigs and women be barren."⁴ *Ficus* and other large trees are generally respected by the Bina tribesmen: "They will not cut them down, for

⁴ Haddon, in JAI, L, 248.

they may be the haunt of some Oboro or other evil spirit. They do not believe that the trees themselves contain evil spirits, but that they are merely the resting-places of those of human beings."⁵ Similar notions were held by the Solomon Islanders who thought that every spot where a man felt awe, such as a deep gorge, a waterfall, a dark pool, or a wide-spreading tree, was a sacred place inhabited by a *figona* or spirit. Thus, there is a large tree not far from Fagani, San Cristoval, where a *figona* lives, past which travellers go silently or speak in whispers. There is a deep river-gorge near the village Raumae, also inhabited by a spirit; if a man ventures into the gorge, his soul may be taken captive by the *figona*, whereupon the man on his return sickens and dies. Near the source of the Wango river is a deep and dark pool, the abode of a *figona*; as the native passes he throws in a bit of areca-nut. The people think that falling stars are wandering spirits and are much afraid.⁶ Man himself, as we shall shortly see, may become possessed: "If a person meets a hostile *tamate* it may enter into him, and if several *tamate* enter in this way the man becomes raving mad, of enormous strength and of incredible swiftness of foot. He is caught with difficulty, mastered and held down by a number of men. A fire is lighted and bunches of a scented shrub called *sav* are heated over the flames to increase their smell and then laid over the sick man's nose. This treatment is applied again and again and the sick man calls out the names of the *tamate* within him, being violently convulsed as he utters them. At last he becomes calm and limp, and after a few hours in this condition, he revives and becomes well."⁷

In West Africa, says Ellis,⁸ "the snake itself is not worshipped, but rather its indwelling spirit." Serpents are the representatives of the spirits among most of the Kafir tribes; crocodiles, being regarded as such, are never killed.⁹ Very often animals become fetishes through being possessed of the souls of the dead. "The Zulu believe that the spirits of their kings after death inhabit the deadly Mamba, and that the *ihloze*, i.e., spirits of their ancestors, inhabit snakes of a more innocent type. The appearance of a medium-sized green snake among the wattles of a kraal fence is always welcomed, and considered to be a visit from, or by, the spirits of their forefathers. The reptile receives the kindest treatment, and is in no way disturbed."¹⁰ The natives of Madagascar call the owl by a name which means "spirit-bird"; it is popularly supposed to be an embodiment of the departed spirit of an evil man.¹¹ Some Bechuana tribes protect the crocodile, thinking that these reptiles keep wolves away from the herds in the neighborhood of rivers.¹² Some Africans distinguish between two kinds of crocodiles: those which man eats and those which eat man.¹³ Certainly where crocodiles eat human beings they become fetishes readily enough, being possessed of their victims' souls. Other tribesmen believe that the souls of the drowned migrate into the bodies of crocodiles; a crocodile that tries to seize a woman going for water is to them "a bad man"; they can even hear him calling for beer and food at night and complaining of the cold.¹⁴ Hyænas are sacred animals among the Bageshu, because "they eat the dead

and are thus supposed to be related to the people."¹⁵ The hyæna is almost universally regarded as a sacred animal in equatorial East Africa. "Among the Wa-Kamba the dead, with the exception of an elder, are thrown into the bush to be devoured by that animal." The hyæna also has magical powers; it cannot, for instance, be shot. The use of hyæna-dung in magic is common.¹⁶ The connection between fetish-animals and the dead is most clearly seen in the case of the Bahima. When the king dies, his body is wrapped in a large cow-skin and taken to Ensanzi, the burial-place of the kings. "Ensanzi is a forest which is inhabited by lions, which are said to be possessed by the spirits of former kings of Ankole; in the forest is a temple and attached to it are a number of priests whose duties are to feed and care for the lions, and to hold communications with the former kings when necessary." When the royal body arrives at Ensanzi it is removed from the skin by the priest, who washes it with milk; "it then lies in state for several days until it swells, and the stomach bursts. During this time the priest is busy daily feeding and feasting the lions with cattle which have been brought as offerings to the departed kings. He also has to find a young cub to present to the people, because the swelling and collapse of the corpse represent pregnancy and birth of the lion king. Directly the collapse takes place a lion cub is produced, and the priest announces that the king has brought forth a lion. He presents the cub to the people, and proceeds to feed it with milk. For some days the people remain until the cub has gained strength and begins to eat meat; all the interest and anxiety now centre in the cub, the corpse receives an ordinary burial and is forgotten; the king lives in the cub." The lions in this forest are sacred; no one may kill them; they are said to be so tame that the priests can move amongst them without fear. The corpse of a queen is treated the same way, but her spirit is supposed to become a leopard. "The priest of the leopard forest takes the body out of the hide and washes it daily with milk whilst it swells; this as in the case of the king's body, is said to be pregnancy, and when it collapses he presents a leopard cub which he says the queen has brought forth." The spirits of dead princes and princesses enter snakes; another belt of the same forest is sacred to snakes; in it is a temple with priests who feed and guard them.¹⁷

The sacred animals of the Hamites of Abyssinia include hyæna, snake, crocodile, and owl. The Galla have a well-defined tree-cult, with sacrifice of milk and black sheep.¹⁸ According to the Hausa certain trees are bound up with the lives of certain persons, while there is an enormous tree of life in Allah's garden; every human being is represented by a distinct leaf and when that leaf falls, the person has only forty days more to live. Nearly every compound has a tree in the center to which offerings are made.¹⁹ In Kikuyu and Kamba belief, fig-trees are sacred, being inhabited by spirits. At the foot of each tree of this kind there is a small clearing, a shrine in fact, where offerings of food are made; though they are known to be eaten by birds and rats, it is believed that the spirits profit by them. If fig-trees are not found in any part of the country, the spirits haunt a prominent rock or rocky hill. There is a sacred rock in the Kitui district where people go regularly to pray to the attendant spirit for increase of worldly goods such as cattle and goats, after pouring a libation of mead at the foot of the rock and sacrificing a male goat. In every Ketosh village, on a spot in front of the hut of the owner of the vil-

19 Tremearne, in JAI, XLV, 51-52.

lage there are four stones planted in the form of a square, in the center of which is a small fig-tree. "This constitutes a kind of village altar, and if any animal is slaughtered in the village, a little of the blood is sprinkled on the stones. . . . When a village is moved, the head of the village moves his altar stones to the new site, and plants a fresh tree amongst them; and in the many deserted villages the position of the chief's house can generally be identified by the wild fig tree. . . . As an example of the importance which they attach to their possession, it is said that it sometimes happens that a Mu-Wanga has stolen a cow from a native of Marama or Kisa, and if the owner could not induce the chief of the Awa-wanga to make the thief return the cow, he would go by night and carry off one of the *Muzimo* stones from the chief's village and hide it away; great excitement would then ensue and stupendous efforts would be made to recover the cow, which rarely failed to be returned to the owner before nightfall in order to redeem the sacred stone."²⁰ Among the Bageshu most large rocks are supposed to be animated. "At various times, when the elder of the village orders it, offerings are made of goats, fowls, and beer, whilst the children take plantains and small offerings of food." The rock-spirit generally speaks through an elder of a village by means of dreams.²¹ A special fetish among the Akamba is a horn of an ox, antelope, or wart-hog, the hollow end of which is filled with samples of various foods and a piece of skin cut from the nose of a hyæna. These horns, called *Kithito*, are very old, having been handed down from generation to generation; "they are looked upon with great awe and mystery, being hidden away in the woods, and they must on no account be kept in houses or their presence would probably prove fatal to the inmates. A *Kithito* must never be handled with the bare hand but can only be safely picked up with a piece of sheep's fat in each hand." Such objects are used in oath-ceremonies; when making peace, the representatives of the belligerent parties will strike the *Kithito* three times with a stick and swear on behalf of their respective people: "If I fight again, may the *Kithito* kill me."²² The idea of possession may be further illustrated by a Congo practice which transfers a spirit to a spear: "When a man is under the sway of the *mingoli* (disembodied souls) he gets his spear, and tying some dried plantain leaves to it he holds it before him with his left hand, and as he trembles with the excitement of the spirits in him, the spear shakes and rustles the leaves until the *mingoli* go out of him into the spear and that spear then becomes . . . a fetish spear, and his luck is bound up in it."²³

The aborigines of Siberia believe that visible objects in general are merely masks or coverings for various anthropomorphic spirits which reside in them; this is especially the case with objects such as stones or roots which have an outward resemblance to the human form. "Animals, though outwardly differing in form from man, are in reality human beings, with human feelings and souls, and human institutions, such as the clan. Some of them, indeed, are superior to man, with higher qualities of mind and body." Such is the bear. It is not the animal, however, which is the object of their cult, but only its "owner," called *ys* by the Gilyak and *icheki* by the Yakut. "The 'owners' of the *tayga*, of the mountain, of the sea, and of the fire, are, of course, the most important for men from the economic point of view. The gods of the sky are regarded as

²⁰ Hobley, *A-Kamba*, 166, 167; and in JAI, XLI, 421, 422; and in JAI, XXXIII, 342-343 (quoted); Dundas, in JAI, XLIII, 31; Hetherwick, in JAI, XXXII, 91.

²¹ Roscoe, in JAI, XXXIX, 188.

²² Hobley, *A-Kamba*, 47, 48, 168.

²³ Weeks, in JAI, XL, 380.

less important, for men do not come into direct contact with them." Nearly all sacrifices are offered to the "owners" of mountains, sea, and fire. Among the Yakuts "every river, lake, stone, and sometimes even parts of these, has its own *ichchi*, who controls it. Movable objects and those which can produce sounds also have their *ichchi* . . . accidents may often happen to a cart or some part of its equipment. Such misfortunes are attributed to the local *ichchi*, who must therefore be placated by sacrifices."²⁴ Pervading the Rig-Veda is a kind of theism which assumes that everything or anything—usually that which is useful to the worshipper, as the plough or the furrow—has a separate divinity; hymns are addressed to weapons and to the war-car, as to divine beings.²⁵ Of the various objects of reverence among the Todas the most important are hills and rivers; villages, dairies, their thresholds and contents; bells; the buffalo and its milk; trees and plants; the sun, fire, and light; and stones. "Any place connected with the gods is revered by the Todas, and this is especially the case with the hills where they dwell." It seems probable that the general idea underlying the dairy-ritual is that the dairyman is dealing with a sacred substance, the milk of the buffaloes. The dairy is a sacred place, and "whenever a devout Toda visits a strange village, he goes to the dairy, and prostrating himself at its threshold, utters a prayer." As the contents of the dairy are regarded as sacred, definite means are taken to prevent these objects from contamination by the gaze or touch of ordinary mortals. Of the objects kept in the dairy the bells are undoubtedly the most sacred.²⁶ Fetish-animals are common in Asia, such as certain dogs and tigers in China, the fox in Japan, and snakes and tigers in India. The cobra is an object of veneration and superstitious awe to the Hindus, in whose mythology it takes a prominent place. Many natives refuse to destroy a cobra, even if they find it in their houses; and when one has taken up its abode in a hole in the wall, it is fed, protected, and conciliated, as though to provoke or injure the reptile would invoke misfortune on both house and family. The British have taken extensive steps to exterminate the poisonous snakes in India, but the natives secretly oppose their destruction. Such fetishistic notions cost dearly, for every year thousands of natives are killed by tigers or from the bite of poisonous snakes.²⁷

If a dead cobra is found on a farm in Borneo after it has been burnt, it makes the farm *mali*, that is, the crops may not be consumed by the owner's family without a death occurring within a year.²⁸ The natives believe that good spirits can warn men against ill luck through animals that are holy—various birds and snakes.²⁹ Trees also come in for a share of reverence. When the Dusuns clear the jungle for planting they always leave a single tree in the middle of the clearing, "lest the birds, having no perching place left to them, should curse the crop." The sap of a certain kind of tree is used for medicine, "but when this is to be collected the proper name of the tree must not be mentioned."³⁰ It is believed by the Singhalese that the king of the devils uses a rod of rattan for punishing his refractory subjects; hence they have a great dread of that plant. "A proof of their dread is that rattan is especially efficacious in

curing madness (possession) by whipping, the mere sight of it sometimes quieting the patient."³¹ The Palaungs "do not worship trees or stones, but make offerings to the spirits that inhabit them."³² A spirit is supposed by the Malays to inhabit iron, for that metal must not be used for cutting hair or finger-nails.³³

All through the Pacific, stones are regarded as the abode of gods or spirits. In Samoa, besides stone idols, a special fetish is an old smooth staff kept in the family of one of the "disease-making craft" and considered to be the representative of the god. This was regularly carried by the priest when he was summoned to visit a case of sickness. "The eyes of the poor patient brightened up at the sight of the stick. All that the priest did was merely to sit before the sick man, and leaning on this sacred staff, to speechify a little, and tell him there was no further fear, and that he might expect soon to recover."³⁴ Gold in Timor-laut is a fetish, a gift of the gods, and when the natives go to wash the sands of the river for gold they set out en masse with religious ceremonies and sacrifices.³⁵ In former times when natives crossed Cook Straits they covered their eyes, "lest the people looked upon the thrice *tapu* rock known as Nga Whatu. Should any person look upon it, then assuredly would disaster overtake that vessel, paddle the crew never so bravely." A more refined notion of spiritual agency among the Maori is that the power of the mother to bear children is a sacred power, bestowed on woman by the great god Io.³⁶ Another ancient Maori belief, still prevalent, is that which pertains to the *tapu* of newly carved houses. "This *tapu* or baleful enchantment has its origin in the fact that the sacred children of Tane the Forest Father have been felled by human hands, and have been carved into the semblance of gods and ancestors. The *tapu* must be disposed of, or its dangerous powers averted, before the house can be safely occupied." Besides his carved house, the chief had two other fetishes: a sharp-edged club of greenstone and a dog-skin cloak.³⁷ When the king at Ponapé was drowned in a river the natives thought that the pitying gods changed him into a blue river-fish, a species which the people to this day refuse to eat.³⁸ Throughout Polynesia birds, beasts, and fish are regularly regarded as fetishes. "A very large number of the Polynesian gods were believed to be incarnate in or to have a practice of entering into creatures of the animal kingdom, and to be immanent in or enter into trees, plants and inanimate objects." It was held also that after a man's death his spirit sometimes either adopted an animal-form or some other or entered into an animal or object. There are examples of women giving birth to animals and of the latter having had a human origin in other ways; there are numerous instances of a man's unwillingness to eat, or even to kill, his sacred object, though other persons, to whom it was not sacred, would not hesitate to do so; there are many illustrations of the friendly and often helpful attitude of an object toward the people to whom it was sacred; and finally there is evidence of its acting as a forewarner of death. Prominent among the fetish-objects were eels, snakes, lizards, and sharks. Worship of these, and it would seem especially of sharks, was common; in one place in the island of Tutuila

there were two sharks which came in when called upon "in the name of an old famous chief."³⁹

It was firmly held by the Tlinkits of Alaska that the evil spirits could not be conjured with any other objects than the drum and the rattle.⁴⁰ Among the tribes of British Columbia copper was held in great esteem; copper plates were named and even clothed, and were fed regularly.⁴¹ There is much evidence among other tribes that implements, ornaments, and other objects of copper were regarded as having exceptional virtues and magical powers, while certain early writers aver that some of the tribes of the Great Lakes held all copper as sacred, making no practical use of it whatever.⁴² Another fetishistic substance was red pipestone, regarded by some Indians as the flesh of their ancestors; "as this red stone was a part of their flesh," it would be sacrilegious for white men to touch or take it away—"a hole would be made in their flesh, and the blood could never be made to stop running."⁴³ Among the Cheyennes, the war-bonnet, the pipe, and stone arrowheads tied in the hair were fetishes. "They wear these stone arrowpoints in order that they may have long life. This is a part of the general belief as to the endurance, permanence, and perhaps even immortality of stone."⁴⁴ While the Apache will not let snakes be killed within the limits of the camp by one of their own people, they not only allow a stranger to kill them, but request him to do so. The fetish-snake is a central point in an important dance of the Mokis of Arizona.⁴⁵ Snakes appear in the arms of the city of Mexico; here birds are fetishes because they can conquer snakes.⁴⁶ In ancient Mexico precious stones were thought to possess mysterious power; there were persons who knew where precious stones grew because, wherever the latter were, they exhaled, at dawn, a vapor like delicate smoke. This cool and moist exhalation made the grass above them always green, which was another sign of their location.⁴⁷ The great boa is the most formidable of all demons who people the spiritual world of the Jibaros. "He is the original father of witchcraft; it is from his body that the sorcerers receive the poison with which their organism is impregnated and the invisible arrow, which they discharge against their victims. After death the souls of the medicine men are also believed to enter into the boa. The Jibaros, like all Indians, therefore particularly fear this monster, and when they kill a boa they think that they kill a powerful sorcerer."⁴⁸

The snake was a notable fetish in antiquity. Its characteristics of living in holes, gliding noiselessly like a ghost, its association with the dead, and its subtlety and other peculiar qualities led easily enough to the notion that it was possessed by a spirit, often an evil one. "Of wild animals snakes had a peculiarly great meaning for the Chaldeans as for most savages of our days. Snakes were symbols of a supernatural wisdom—they were attributes of Ea, the godlike wisdom. Probably snakes were kept in some Babylonian temples and there used as oracles."⁴⁹ Snakes and dragons have been common as

treasure-wardens; a familiar motif in mythology is the destruction of dragons by heroes.⁵⁰ The serpent has been worshipped in India, Phœnicia, Persia, Greece, Italy, Lithuania, and elsewhere,⁵¹ and in China the dragon has been since time immemorial the principal divinity of rains and water.⁵² Like the American Indians, the Arabs have their snake-dance.⁵³ The snake as an evil daimon, as tempter, and as a creature associated with wisdom has been clearly depicted in the Old Testament.⁵⁴ Snake-worship was well known in Greece, while in Rome snakes were regarded as house-genii and grave-spirits.⁵⁵ In the mysteries several characterizations of the serpent were manifest: as a good, protecting divinity; as an avenging cult-creature hostile to mankind; and as the cosmogonic principle. To serpents were also ascribed generative power.⁵⁶ Superstitions regarding snakes still exist. "Near Leeds they say that when a snake crosses the path rain is near; and in West Sussex to kill the first snake you see in the year gives you power over your enemies for a twelvemonth, or its skin hung up in the house brings good luck to the tenant. In Shropshire, the dragonfly is the supposed harbinger of the adder, and is consequently called the Ether's Nild or Needle, and the Ether's Mon (man) in various parts of the county. In the Isle of Wight they give the insect the name snakestanger for a like reason. A sickly-looking person with a ravenous appetite is said to have a 'nanny-wiper' in his or her stomach, and the only way to lure it forth, say the Sussex people, is to fill a saucer with milk and lie near it with the mouth open, feigning sleep. The nanny-wiper will shortly creep forth to drink the liquor, and may then be killed. In the North Country it is believed that if a native of Ireland draw a ring around a toad or adder, the creature cannot get out, and will die there, but in the West Country one should make the sign of the cross within the ring, and repeat the first two verses of the Sixty-eighth Psalm."⁵⁷

In the old days gems were among the most important media for the transmission of supernatural powers. It is not surprising that the attention of people on the lookout for mystery and supernaturalism should have been arrested by precious stones, which seem to the dazzled observer to give out their rays as from a vital principle within themselves rather than to owe their glitter and gleam to reflected light; and it is easy to understand how they came to be regarded as the abode of occult powers. Most of the stories of the secret virtues of precious stones are derived from the East. "The diamond among the ancients was the symbol of severe and unswerving justice; the judges in Hades had hearts of adamant. It was believed to preserve its owner from illness—a property proved, it was considered, in the time of the plague, when the disease spread rapidly among the poor, and the rich who wore diamonds escaped. The stone gave victory if the cause espoused were just; it acted as a talisman against witchcraft, but lost its power if its owner sinned. It calmed anger, bestowed fortitude, and strengthened wedded love. It was a favorite superstition, frequently repeated in the old books on the subject—through the want, one would imagine, of any experimental ardor—that the diamond could be wrought upon by goat's blood. 'The diamonde which neither iron nor fier will daunt, the blood of the gote softeneth to the breaking.' Pliny adds that,

since mortal ingenuity could not have discovered the fact, it must have been revealed to man from Heaven. The gem was held to be able to reproduce itself. De Boot, in his treatise, relates a story of a lady who had two hereditary diamonds which produced a numerous progeny; and Sir John Mandeville, who accepts the theory of reproduction, declares further that by personal experiment he convinced himself that diamonds grew in size. Most precious stones were used medicinally in a pounded state, but the diamond was held to be a deadly poison. It is enumerated among the poisons administered to Sir Thomas Overbury in the Tower, and Benvenuto Cellini, in his fascinating autobiography, relates how his life was spared through the dishonesty of an apothecary, who, engaged to poison him by pulverizing a diamond and putting it into his salad, substituted a beryl for the more costly stone. Many of the most potent gems were obtained from animals. Best known, perhaps, of these is the toad-stone, to which Shakespeare alludes: 'The toad, ugly and venomous, wears yet a precious jewel in its head.' This stone warned of poison by its change of color, and might be used to allay the pain of an envenomed bite; it was a preventive of the burning of houses and the sinking of ships. To test the genuineness of the gem, Lupton instructs the owner to 'holde the stone before a tode so that he may see it, and if it be a right and true stone the tode will leape towarde it and make as though he would snatch it. He envieth so much that none should have that stone.' Serpents were supposed to possess precious stones of inestimable value. In the *Travels of Two English Travellers*, published in 1611, there is an account of a jewel taken from a serpent's head and used in conjuring. Alexander was said to have seen serpents in the Vale of Jordan with collars of huge emeralds. "A stone found in the head of the vulture bestowed health and success. The eagle stone, to be sought for in the nests of eagles, rendered its possessor amiable, rich, and sober. It might further be of service in the detection of theft. Two stones were possessed by the swallow, a red one for curing insanity, and a black one which brought good luck, and which, tied about the neck, prevented fevers and cured the jaundice. The swallow was further able to find a stone on the seashore which restored sight to the blind. The tears of the crocodile had their value for the ancients, since they crystalized into gems." The opal at the present day is considered unlucky, but in the Middle Ages it was highly prized, as it was held to unite the special virtues of every stone whose copy it simulated. "The emerald strengthened the eyesight. Nero, who was extremely shortsighted, was accustomed to view the combats of the gladiators in the arena through an emerald. The supposition is that it formed a concave lens, but the help it afforded him was considered due to the virtue of the gem. Worn in a ring, the stone was a preventive of epilepsy. A ruby, by its darkening of color, warned the owner of disaster. According to other authorities it conferred the power of seeing in the dark. If the four corners of a house were touched with it, it preserved from lightning and tempest. The strength of the topaz was said to wax and wane with the moon. It had the peculiarity of at once cooling boiling water, if thrown into it. The crystal dissolved all spells of witchcraft, while the onyx was a dangerous ornament, since it exposed the wearer to the assaults of demons and gave him bad dreams." The faith in the efficacy of certain stones to cure disease continued to a later period. The sapphire was generally believed in the seventeenth and earlier centuries to give help in all diseases and troubles of the eye. This idea was probably derived from Greek and Latin tradition as to the *sapphirus*, a name referring not to our sapphire but to lapis-lazuli, to the power of which

a certain remedial effect might be conceded. As far back as the Ebers Papyrus, or about 1600 B.C., lapis-lazuli is noted as an ingredient in eye-washes. "In old St. Paul's was a sapphire given by Richard de Preston, citizen and grocer of London, for the cure of all infirmities of the eye. And, even in our own day, we must remember the widespread faith among nurses in coral and amber necklaces, as preventives of convulsions and other infantile disorders. Royalties naturally have always had more than their fair share of gems, magical or otherwise. The late Shah of Persia possessed a casket which was held under certain conditions to have the power of rendering the royal wearer invisible. A diamond set in a scimitar and a dagger made him invincible, while a talismanic star in his possession forced conspirators to confess their crimes. Our own King John, as a believer in their occult qualities, was an ardent collector of precious stones. Holinshed mentions that he suspected some pears to be poisoned, since the jewels he wore became covered with a dewy film. Both Charles V. and Queen Elizabeth possessed Bezoar stones. These were obtained from the kidneys of a wild animal of Arabia, where it was supposed they had been formed from the poison of serpents, and were a potent charm against plague and poison. One explanation of Elizabeth's power of healing the king's evil was that it was by virtue of some precious stone in the possession of the crown of England."⁵⁸

Allied to the precious stones was jade. In ancient Britain it was an object of superstition, employed as an ornament or amulet and not for practical use.⁵⁹

§249. The Exuvial Fetish.

AN object that becomes a fetish merely through intimate association with a person falls in the class of personality-symbols. Such is the Australian *churinga*. Many of these objects originally belonged to the ancestors, though in some cases they are the *churinga* of men now alive who are regarded as the reincarnations of ancestors or of men who have lived within the recollection of those who are now handling the *churinga*. Reverential care is bestowed upon these objects and "no quarrelling of any kind is allowed anywhere near to where the *churinga* are stored, those spots being regarded as especially sacred."¹ In some cases the *churinga* representing certain animals are supposed to be endowed with special magic power. "If our native is desirous when a young man of promoting the growth of his beard, then he persuades an older man, who belongs to a rat totem, to rub his chin with a *Churinga*, which represents the rat. The sacred object is painted with long lines of black and red, which indicate the long whiskers of the animal, and the rubbing results in some whisker-growing virtue passing from the *Churinga* into the chin."² Personality-symbols often have a definite bearing on the institutions of marriage and government; in some places, for instance, "in order not to be troubled in the use of his rights, it sufficed the husband on duty to hang on the door of the house and on the wife's door his shield and his sword or knife"³—a practice developed under polyandry. In the Sahara, when a husband goes away for a long time he takes the precaution of leaving one of his shirts on the nuptial

couch. "Henceforth his wife is protected, his honor is safe. If he finds on return an increase in his family . . . this posterity will be his. The little ones will be his . . . not merely by name, but of his flesh and blood. The son born two years after his departure was conceived by his acts! Nobody falters or smiles when he affirms this. The shirt has simply wrought a new miracle, or rather Allah has done it for he has caused the infant to sleep during this time in the womb of his mother. . . . Praised be He, the Powerful, the Mild, the Compassionate!"⁴

Insignia of office fall into the fetish-class, for they are personality-symbols of rulers. The Kaffir sign of royalty is a necklace of large reddish beads, which is put on at the king's inauguration. Royal women wear various ornaments which common mortals may not wear, even though they have them, or the first chief who came along would take them away as of right.⁵ The umbrella, the stool (a solid block of wood corresponding in height to the importance of the chief), and the pipe and leather tobacco-pouch are insignia of state in West Africa; and there is the stick of office, usually silver-headed. "The same honors and respect are paid to the stick as to the person to whom it belongs. It has an almost sacred character, and it is an unheard-of crime for an ambassador, furnished with this emblem, to be molested."⁶ In the Sudan the carrying of an umbrella is the exclusive right of the sultan, and the custom is paralleled in India.⁷ So too the shoe is a personality-symbol, both in India and among the Hebrews.⁸ Ear-plugs and labrets in Mexico, and forehead-bandages among the kin of the Inca—he himself alone having the right to wear a red one and a red aigrette—are American symbols.⁹ Among the Norsemen the sword was used in oath-taking—at first that of the leader and later a special sword of ceremony.¹⁰

A more extensive group of personal fetishes are the exuviae, parts of the body, whether of the living or of the deceased, in which the soul inheres. An excellent example of a part of the body which is not only dispensable but which must be severed, is the umbilical cord, and with it the placenta. The treatment accorded such exuviae shows clearly enough their fetishistic nature. No sooner is a child born in Central Australia than it becomes the object of magic arts: the navel-string is dried, swathed in fur, and tied round the child's neck. "The necklace not only facilitates growth, keeps it quiet and contented, but it also has the admirable faculty of deadening to the child the noise made by the camp dogs."¹¹ Great importance is attached to the placenta in the Ibo country of Africa; it seems to be in some way a counterpart of the child, while the burial of the placenta is held to be a necessary rite if the mother is to bear any more children.¹² Among the Nigerians the part of the cord left on the child is washed continually until it atrophies and comes off, the time being variously given as between three and fourteen days. It is then either burnt, when the ashes are put into a pot of grease and rubbed on the child's head to make it hard, or ground and eaten with yam, or planted at the roots of yams, to ensure a good harvest the following year.¹³ Seligmann¹⁴ cites

many cases to show that the placenta is regarded in Egypt as the double, physical or spiritual, of the infant. But the most striking example of the importance ascribed to the placenta is to be found among the Baganda, a Bantu people, with kings of predominantly Hamitic blood. Even among the commoners the after-birth was called the second child and was believed to have a spirit which at once became a ghost and attached itself to the stump of the umbilical cord. For this reason the umbilical cord of a prince was treated with the greatest reverence. "The placenta of a prince is always preserved; it is called the *mulongo*. It has power to kill the offspring of royalty if not respected and treated with honour. Kings therefore always keep their placenta and have it decorated and treated as a person; it is confided to the care of the second greatest earl. After death it is placed in the tomb with the *Lwanga*" (jaw bone). Each new moon, in the evening, it is carried in state, wrapped in bark cloths, to the king, and the earl in charge, on his return, smears the decorated cord with butter and leaves it in the moonlight during the night. The two ghosts, the one of the placenta attached to the *mulongo* and the other of the dead king attached to the *Lwanga*, are brought together in the tomb or shrine and form a perfect god to whom offerings are made.¹⁵

The Hindus treat the umbilical cord in the following manner: the cord is cut with a knife at a distance of two inches from the navel. This piece is buried, with turmeric and salt, in a corner of the accouchement-room. The piece that remains is smeared at the end with a little musk and tied with cotton thread; the latter is wound loosely around the neck of the child and remains thus until it gets dry and separates from the navel. It takes from four to seven days for the cord to fall off. The navel is then filled with a native preparation of dentifrice, and a copper piece is put on top and tied with a piece of cloth around the belly.¹⁶ Among the Palaungs, "when the navel cord that is attached to the child drops off, it is kept with great care, as it is believed to be a remedy for toothache, if rubbed on an aching tooth. The string that had been tied round it is buried."¹⁷ Among the Maoris, who had the curious belief that the unborn child receives nourishment through the fontanelles, which they called "food-holes," the umbilical cord of a chief's son was often placed under a stone or on a tree at the boundary of the tribal lands to maintain and strengthen the tribal influence over such boundary. At Te Ariki is a tree in which the cord of a priest's child was hidden, and the hole closed with a piece of precious greenstone; this latter addition was thought to enhance the *mana* of the umbilical cord.¹⁸

As the umbilical cord was considered by certain Indians of Canada to be closely connected with the child's disposition, care was taken to bury it in the woods to make a boy fond of hunting, near the lodge or in the garden to make a girl fond of domestic duties. If an animal found and devoured the cord, the child was likely to resemble that animal in disposition.¹⁹ There was a sort of imitative magic in the treatment of the umbilical cord by the Kwakiutl. When the cord dropped off, the father, if he wished the child to become rich, tied it up and put it in a box in which he kept his expensive copper. "Therefore the child will be able to obtain coppers easily when he becomes really a man." When it is desired that the owner of an after-birth should understand the cries of the raven—which is an important thing to know, for the raven warns

of the advancing enemy—the after-birth is left on the beach where the ravens peck at it. If the parents desire the boy to become a seal-hunter, they give his navel-string to a successful hunter who puts it between the prongs of his harpoon-shaft; if they wish him to be a canoe-maker, they slip it under the deerskin lashing of the adze of a canoe-builder; if a song-leader, it is inserted in a hole in the end of a baton; if a salmon-fisherman, they put it into the neck-ring of a man who catches many fish; indeed, "all the expert workmen wear the navel-strings of boys, and wear them around their necks." The same thing is done with the navel-strings of girls: they are worn around the wrist by women basket-makers or around the neck by women who know how to dry halibut or how to cut salmon, or by those who know how to dig clams, so that the girl when she grows up will be successful in these occupations. "When they wish a girl or a boy to be a good dancer when he or she grows up, they put the navel-string of the girl around the legs of a woman who is a good dancer; and when she knows well how to tremble with her hands, they put it around the wrist of her right hand. They do this, that the girl may know well how to tremble with her hands when she dances. And they do the same with the navel-string of the boy; it is put around the wrist of an expert cannibal-dancer, that he may become a good dancer when he grows up."²⁰ A charm common to Sioux, Cheyennes, and Arapahoes consists of a small piece of the navel-string of new-born children, which is enclosed in a case made of buckskin, decorated with porcupine-quills and beads, and hung about the necks of women or tied to the clothing of children up to the age of six or seven years.²¹

The hair, often thought to be the seat of the soul, forms another type of exuvial fetish.²² In Central Australia hair is associated with what we may call helpful magic. When a man dies his hair is cut off and made up into a girdle called by a native term which means "grave-flesh." "This, which descends to a son, is one of the most sacred possessions of a native, and when worn during a fight endows the possessor with all the warlike attributes of the dead warrior, and ensures to him accuracy of aim, and at the same time destroys that of his adversary. How sacred it is may be judged from the fact that as yet only one has passed into the possession of white men."²³ Among the Euahlayi tribe a lock of hair is a token of hate rather than of love.²⁴ In Punjab the hair of a child, when cut off, is put into a silver amulet and carried about with one. It is deemed sacred. If one have it, no evil influence can prevail over him.²⁵ Among the Cree a little hair is sometimes cut off from the head or body of an old person and saved. That it is a fetish is evidenced by the fact that "it is asked from time to time to give the survivors a blessing." A mourning-custom of the Dakota shows the connection between the hair and a spirit: "A lock of hair of the deceased is taken and kept in a bundle which is placed in the rear of the lodge in the sacred place. After a time a feast is given, and a person of the same age and sex of the departed takes the clothes making up the bundle and eats the food. The lock of hair is then buried and the spirit remaining in the hair is thought to leave." The death-bundle, containing a lock of the deceased person's hair and supposed to harbor one of his spirits, was kept by the central Algonquins.²⁶ The Papuans of the Loyalty Islands set up the skulls of the dead as household gods and appealed to them for aid in diffi-

culty.²⁷ The New Caledonians, in cases of sickness and other calamities, presented offerings of food to the skulls of the departed. "The bodies of the common people as well as those of the chiefs were treated thus. The teeth of old women were taken to the yam plantation as a charm for a good crop, and their skulls were also erected there on poles for the same purpose."²⁸ A fetish among the Fan, which the headman carries to war, is a tin canister containing portions of the skull of a male albino and of a chimpanzee, red powder, and a variety of native medicine.²⁹ The Filipinos preserved the hair and sometimes the skulls of the deceased as sacred relics.³⁰ The Maoris sometimes kept skull-fetishes and in one instance they cut off the head of an Englishman, believing that it had the gift of prophecy and that through its aid they would be rendered bullet-proof and gain victory.³¹

In South America too the skull of the deceased is a common exuvial fetish; especially is this true of the Indians of Ecuador who have an elaborate ceremony connected with the *tsantsa* or shrunken head. Their practices appear to rest on certain fundamental ideas: that in the trophy is seated the spirit or soul of the killed enemy; that the spirit, attached to the head, is thirsting for revenge and is trying to harm the slayer in every possible way; that in case this danger is neutralized through the different rites of the feast, the trophy is changed into a fetish, a thing charged with supernatural power which the victor may make use of in different ways and in various departments of life. If all rites are properly performed, the *tsantsa* becomes a source of blessing to the slayer himself and his whole family. "The power which the trophy is supposed to possess, of course, is due to the spirit attached to it, just as the natural magical power of the living human body depends upon the soul or vitality inherent in it. The souls or spirits of dead men are endowed with an especial energy and potency, and among the Jibaros, as among other South American Indians, all gods, spirits, and demons seem to be nothing but departed human souls." The ceremonies at the feast have as object to protect the victor against the spirit of his enemy and also to increase by artificial means the natural power of the trophy, in much the same way that a battery is charged with electric force.³²

In all ages miscellaneous relics of the dead have been preserved as fetishes, any part of the body serving for the purpose. The Loyalty Islanders preserved finger-nails, teeth, and tufts of hair. "These seemed to be their principal idols. The priests, when they prayed, tied on to their foreheads, or to their arms above the elbow, a small bag containing such relics of their forefathers."³³ In each house in San Cristoval, "relics of the dead are preserved, the skull, or jawbone, a tooth, or hair. These are placed in a coconut leaf basket, and hung up at the top of the main post of the house. Sacrifices are burnt below and the smoke and savour of the burnt sacrifices ascends and is pleasing to the ghost."³⁴ The most striking feature of the funeral-customs of other Melanesians is that the skull and certain bones are taken from the body, the skull being kept and the bones worn, while certain limb-bones are made into spatulæ, with which relatives feign to take lime. The jawbone of the dead man is worn by his widow, and his vertebrae and phalanges by his wife's brothers

and his own children of both sexes. The dead woman's lower jaw is worn by her husband, while her cervical vertebræ are worn by her mother-in-law and her husband's sisters, the former also wearing a number of her phalanges. In some cases the dead man's jaw is worn as a bracelet by one of his children.³⁵ What immediately strikes the eye of the traveller in British New Guinea is the habit of wearing round the neck a dried human hand with the flesh and nails adhering and complete. To touch, the hand was quite pliable; it had evidently been smoke-dried. The writer³⁶ concluded that the hands were those of enemies. He also noticed "many men wearing necklaces of human bones and jaws," which he took to be those of relatives. He goes on to say that the upper Koko people, when making signs of hostility, instead of following the orthodox practice of drawing the hand across the throat, did the same to the wrist.

Relics take a noteworthy part in charms throughout India. "Not only are things brought from Lhāsa credited with occult virtue because of their association with that holy city, but dust from temples, scrapings from sacred rocks, leaves of sacred trees, the coverings of idols, bits of robes of re-incarnated Lāmas and other holy men, and even the nail parings and bodily refuse of the Grand Lāma, are similarly honoured."³⁷ Among some tribes a fragment of the charred remains of the funeral-pyre on which a man dying on a Sunday or a Tuesday has been cremated on the very day of his death, is valued as a powerful charm against many diseases. "Such a piece of charcoal is hung on the neck of a sick man with fresh thread which has never come in contact with water or other liquid. But such charm, to be efficacious, must have been brought from the burning-place the very night following the cremation, and the person bringing it must have gone to the cremation place stark naked. . . . Similarly, a mushroom growing on the remnant of a log of wood used in burning a corpse is believed to be a powerful remedy for hysteria. . . . A sword with which human blood has been shed and death caused, is believed to acquire a most powerful energy through contact with blood and death. In fact, the Orāons and the Mündās say that a powerful spirit 'rides' on such a sword. Thenceforth the sword becomes an object of religious awe. It is carefully suspended against the inner wall of the owner's house, and at every festival a few drops of liquor are offered to the sword."³⁸ A few years ago, according to the newspapers, some Hindus in California tried to get the nails from the little fingers and the second toes, four teeth from the mouth, and a small disk of skull from the body of a Hindu who had been murdered.³⁹ Wilkins⁴⁰ states that except in the case of Krishna's bones being preserved in the image of Jagannātha at Puri and the parts of Parvati being preserved in these temples, there is no regard for relics shown by the Hindus. Enshrined in Kandy, a mountain town on the island of Ceylon, is an alleged tooth of Buddha. This "holy tooth" is to the Buddhists what the Holy Sepulcher at Jerusalem is to the Christians, and what the birthplace at Mecca of the greatest of Arabian prophets is to the Mohammedans. It is believed by the pilgrims to its shrine to have come from the sacred mouth of Gautama Buddha, the founder of their faith. As a matter of fact, this profoundly venerated object looks suspiciously like the tooth of a wild boar or a monkey. "If Buddha ever carried this tooth in his head and the rest of his teeth were of proportionate size his mouth must

have been as large and ferocious as that of a gorilla."⁴¹ Lip-amulets are common in the Indian Archipelago; if made from the mouth of a still-born child, they will whisper warnings. The skin of an unborn child is also used to foresee the future, while other exuviae of a child are used as amulets.⁴²

The Guiana Indians, believing that familiar spirits often ensconce themselves inside bones taken from a grave, wrap these up with cotton into grotesque figures, and expect them to give oracles: "they say it is the Spirit of the Dead that talks. They sometimes put the hairs, or some bones, of their deceased parents into a calabash. They keep these in their huts, and use them for some sorcery. They say that the spirit of the dead one speaks through these, and forewarns them of the designs of their enemies. More than this, bones prepared with cotton, as above mentioned, are used for bewitching their enemies, and for this purpose the sorcerers wrap them up with something that belongs to their enemy." Some of the tribes exhumed bones or bodies, burned them, and drank the ashes mixed with liquor.⁴³ Again, dice are fashioned from the thigh-bone of some celebrated player, much as horses' bridles are ornamented with the tail of some celebrated racer⁴⁴—a logical method, once granted the major premise, of improving luck.

"And it came to pass, as they were burying a man, that, behold, they spied a band of men; and they cast the man into the sepulchre of Elisha: and when the man was let down, and touched the bones of Elisha, he revived, and stood up on his feet."⁴⁵ This is one of the early examples of the miraculous power of relics. "The adoration of relics among the Sunnites and Shiites has assumed just as repulsive a form as in Buddhism or in the Christian church."⁴⁶

The press of today recurrently reports miracles connected with relics, and often goes into historic detail concerning the latter. We cite representative cases. A few years ago thousands of pilgrims from all parts of the Orient flocked to Goa, a Portuguese possession on the east coast of India, to view the exposure for the first time in twelve years of the incorruptible body of St. Francis Xavier, the first Jesuit missionary to India and the Apostle of the Orient, who in 1542 carried Christianity to the Far East. Thousands of Christians and Hindus were allowed to view the body and to kiss the feet of the saint. A Delhi correspondent, who was present, wrote in part as follows: "The right arm is missing, having been removed by order of the Pope in 1614 and divided into four parts, the largest of which is enshrined in . . . Rome. The fourth and fifth toes of the right foot are also missing, one having been bitten off in 1554 by a Portuguese lady . . . in a frenzy of religious zeal. Indeed, it was the vandalism of relic hunters that led to the abandoning of the annual exposition of the body."⁴⁷ A famous saint whose relics are highly revered in this country, and more especially in Canada, is Ste. Anne. Her first shrine on this continent was established on the banks of the St. Lawrence river above Montreal, at a little village which subsequently became known as Ste. Anne de Beaupré. It has been visited by thousands of people and many miraculous cures have been ascribed to the relics. The crypt of Ste. Anne is supposed to have been discovered by Charlemagne, toward the close of the eighth century; then the chief cities of Gaul begged a portion of the body, and fragments

found their way to privileged destinations through the favor of princes or powerful prelates. The arm is said to have been put under the care of the monastery of St. Paul-Outside-the-Walls at Rome. From one of the hands, deposited in the Cathedral of Carcassonne, a finger-joint was in 1669 bestowed on Francis de Montmorency-Laval, first bishop of Quebec; and from the same source, we are told, came the relic of Ste. Anne, which Mgr. Marquis obtained in Rome in behalf of Quebec. It is this last relic which now reposes at the church of Ste. Anne de Beaupré. There are said to be two churches in Connecticut where there are relics of this saint: at St. Louis's in New Haven and at a French church in Bristol. Many cures have been reported in both places. Yearly the devout throng to make a special *novena*, and on July 26, Ste. Anne's Day, visit the church and touch the relic to attain cures.⁴⁸ It is stated that an exuvial fetish of another sort was discovered in 1924 in the National Library of Paris; it was the embalmed heart of Voltaire, in a small casket beside a plaster bust of the famous man.⁴⁹

§250. The House-Fetish.

THE Melanesian Koita formerly buried their dead in front of their houses; this was done because "man no like pig and dog, take him [*i.e.*, pig or dog] long way from village, must bury him in street."¹ The natives of British New Guinea have an intense desire to keep the remains of dead relatives near them. "The old custom on the coast, both on the south and on the north coast, was for a dead body to be buried in or under the house or in the village. The government have forcibly compelled the natives to give up this custom. At Maiva, on the south coast, it once became the custom for the natives to openly bury the body in the appointed cemetery, and for them to secretly exhume it afterwards and to bury it in or under the house. In Mekeo it became the custom for the natives to go and live for two or three weeks in the cemetery after a relative had been buried."² Such is the tenacity of religious customs.

On the Upper Congo most bodies were buried in or near one or other of the houses belonging to the deceased.³ The Wawanga of East Africa bury all their dead—males lying on their right side, females on their left; "married men are interred in the chief wife's hut, between the centre pole and right wall, looking towards the door; that is to say, feet at centre pole, heads towards wall. Women, children, and unmarried males are buried under the verandah of the hut—males to the right, females to the left of doorway; in both cases the feet towards the door."⁴ The fetishistic nature of the threshold is clearly seen among the Hausa, where "the threshold is a dangerous spot, and children, who do not understand this, are always coming to grief there, their falls being due entirely to the presence of the spirits." Before the owner has completed a new building he must offer up a sacrifice at the threshold.⁵

With the exception of two tribes, all the Nagas bury their dead in the ground either close by the village or in the village-streets in front of the houses, or, in the case of a young child that dies or one that is born dead, inside the house, under the earthen floor. Furness⁶ was told by a Sema Naga, who pointed

out to him on the floor of his house the newly made grave of his little girl, that he had buried her there because she would be so frightened to be left out in front of the house with nothing but the sky above her at night. In Assam the graves are in front of the houses in the village.⁷ The Samoans dug graves close by the house, while the natives of the Mitchell Group buried the dead inside the house.⁸ The Tahitians often buried their dead in the *marae* or social center; a chief's grave, a temple, and a sacred enclosure were all one. "The presence of pyramids on the green is only natural since kings' and chiefs' tombs were often pyramidal, so it was at least in Tonga, and it is possible that the circular guest house in Samoa is derived from a pyramid."⁹

The Creeks usually buried their dead in a square pit under the bed where the deceased lay in his house.¹⁰ The custom of burying the dead in the house was common in Brazil, and, according to von Martius,¹¹ injurious to health. Among the Guiana Indians the site for the burial of the dead was either the deceased's own house or its neighborhood, though special localities or cemeteries were not unknown. Among certain tribes some of the large houses have more than a hundred graves in them, but when the houses are small and very full the graves are made outside.¹²

§251. Hearth- and Altar-Fetishes.

IN Melanesia and Polynesia that which localized the sacred ceremonies was the worship of spirits or departed souls at graves. Hence these became a place of worship at which was later added the service of other spirits and gods.¹ The *marae* or village-centers of the Polynesians, in which chiefs and kings were buried, were sacred enclosures containing pyramidal structures; they were places of sacrifice and worship. Many religious emblems were there, and there also were performed the religious ceremonies.² Among both peoples "certain weird spots in the bush, or on the mountains or seashore are tremblingly passed or avoided, as the dwelling-places of demons and spirits of the dead."³ Among the Fijians and other Melanesians the *nanga* or sacred enclosure was the earthly dwelling-place of the ancestral spirits. The first fruits of the yam-harvest were always piled in the *nanga* and allowed to rot there; warriors before entering on an expedition always repaired to the *nanga* to be made invulnerable.⁴

In West Africa two different forms of shrines or temples have arisen from the method of burial. In one case, the corpse is buried in an underground cave, with a narrow passageway leading to the interior; dirt is prevented from falling in by walling the sides; upon the grave is erected a mound of stones. The two main characteristics of this form of burial give us the pyramid: a passage under the earth and a stone mound. The second type of temple also comes from the method of burial. When anyone on the Loango coast dies, a little hut is erected over his coffin and foodstuffs deposited there. On the north Guinea coast a little hut is built over the grave, containing everything the person used when living. In other places the bones of the deceased are preserved, dried, and enclosed in a wooden box, which is then deposited in an especially erected little house. Similar to these fetish-huts of the West Afri-

cans are those, often only two feet high, which Livingstone found in the villages of the Mangaja—huts erected at the death of a relative in which a share of the best food and drink was left, so that the souls might be refreshed.⁵ In Abyssinia, Bent⁶ noticed the pyramidal type of tomb. As in the case of the Melanesians and Polynesians, the grave of a hero, chief, or king, with a mound or stone erected over it, becomes a temple, meeting-place, and center of tribal life. It often becomes a sanctuary as well. Throughout the Elgon district of East Africa there are certain places where a fugitive from justice may take refuge: "such spots are usually the burial places of great chiefs and are regarded as sacred; for instance, the cemetery of the Wawanga kings. If a man take refuge in a sanctuary, the owners of the same are bound to protect him and prevent others following him, even by the force of arms. As soon, however, as the fugitive leaves the sanctuary, he may be apprehended."⁷

At the highest point of a pass in Central Asia is a Buddhist shrine to which natives from all about bring rude gifts, such as horse-hair and camel-hair; they even leave empty bottles.⁸ The Todas of the Nilgiris have a temple-hut,⁹ while in Hindustan is a shrine which imitates in stone an old mound over a grave with an altar on top.¹⁰ The Mongols regard the threshold of the tent as a fetish-place which visitors must not touch; nor may one handle the tent-ropes, "for they are held to represent the threshold of the door." The author's¹¹ companion unwittingly touched the threshold when backing out of the tent; he was arrested but got off with a reprimand. On Mindanao, in the Philippines, "in every house, even the poorest, is the *tambara*, the little bowl containing the usual offerings, the simplest form of house-altar. The greatest of their altars, the *patanon*, or war-altar, is also a house-altar. The erection of this altar is allowed to only a very few high datos, and is connected with their most important festival, which occurs sometime during rice planting." The Bagobos have other altars for different places and different occasions; "altars for the planting of their corn or rice; for the cutting of their crops; and very often they place an altar with their offerings near a great tree or a beautiful spring or running water, especially if the water is to be used for any ceremony of purification."¹²

The graves of shamans among the Tlinkits are located at some little distance from the village on a small island, conspicuous point, or high promontory, sometimes selected by themselves before death. The sepulcher itself consists of a small pen or enclosure of logs, usually elevated above the ground on four short posts. These are fetish-places, and "whenever an Indian passes one of them in his canoe he drops an offering of some value (usually a piece of tobacco) into the water to propitiate the *yake* of the deceased and bring fair winds and good luck to the superstitious donor." The Haida commonly put the ashes of the dead in a box within a mortuary column, while if the body was buried rather than cremated they erected commemorative columns in front of the house of the deceased, the body being deposited at some distance from it.¹³ The American Indians commonly placed altar-shrines near springs, rivers, caves, rocks, or trees on mountains and near spots which certain deities were supposed to inhabit, "in the belief that the roads of these deities

extend from these localities."¹⁴ All springs of water are places of prayers and offerings, and each has a shrine either near by or remote. Some shrines are known by the character of their offerings; thus, as a warrior's shrine contains netted shields, bows, and arrows, an eagle-shrine is furnished with painted wooden imitations of eagle-eggs. Shrines sometimes mark places where mythological events are said to have happened; thus, "the shrine of the so-called Heart-Contained-Here, in the foothills east of Walpi, is supposed to contain the heart of a god who won a mythic foot-race. Those who aspire to speed in these races worship at this shrine." A Hopi shrine is said to differ from an altar in being a place in which the offerings remain permanently or until they or their essence are supposed to have been removed by the gods.¹⁵ The Zuñi employ caverns as shrines and as depositories for images of their gods and the painted bones of animals, and caves have an important place in the genesis-myths of many tribes. "Burial in caves was common, and chambers of various depths from the surface were used. Pits and crevices in the rocks were also repositories for the dead."¹⁶ One burial cave is called by a term meaning "where the dead are dancing."¹⁷ Whenever a permanent village of earth lodges was established by the Osage and Kansa, there was a regular consecration of a certain number of fire-places before the ordinary hearths could be made by the common people. "The consecrated fireplaces were made in two parallel rows, beginning at the west and ending at the east. Four sticks were placed in the fireplace, one pointing to each corner of the compass."¹⁸ The Indians of Virginia bestowed the greatest labor upon their temples; "these buildings were about 20 by 100 feet, with the door to the east so as to catch the first sunlight. There was a chancel at the western end, approached by a labyrinthine passage, and here were placed many black images with their faces turned to the east. The principal temple was situated at Uttamussack, on the modern Pamunkey, and on either side of it stood buildings 60 feet long, containing effigies of kings and devils, and the royal mummies. The treasure-house of Powhatan at Orepaks was doubtless a still more imposing structure; it was 50 or 60 yards long, and upon each of its four corners was placed a figure of a strange and grotesque aspect, one having the shape of a dragon, another the head and form of a bear, a third that of a leopard, and the fourth a gigantic man."¹⁹

Not far from old Babylon lie the graves of Ali and his son, which are fetish-places to which pilgrims travel year in and year out from all Persia. A burial in the neighborhood of these holy ones wipes out all sins, wherefore many Persians have themselves buried there.²⁰ Like the Aztecs, the Israelites took their portable temple on their wanderings, and one may conclude that they once carried the bodies of their tribal heroes. For the Israelites this is not easily demonstrable, yet they took the body of Joseph out of Egypt with them and buried it after the entrance into Canaan. Presumably the tabernacle was originally a fetish-hut of the dead. The ark was a receptacle for fetishes; the tablets of the law were placed in it. It was the palladium first of the family, then of the tribe, and later of the people. Not only was it the Ark of the Covenant but also a war-altar, and a religious shrine.²¹ According to one

writer,²² the Greek temples had their prototype in the house (for human beings and cattle together) of the Roumanian Alp-land. In Rome the first domestic altar was the hearth; as the local center and symbol of domestic intercourse, it was at the same time the altar upon which sacrifices were made to the household gods. What the hearth was to the individual family the hearth of Vesta was to the collective nation.²³

§252. The "Word."

THERE is magic in words, written or spoken, for fetishes are not limited to material things.¹ When Nieuwenhuis² was travelling in Borneo he was once asked to drive out of some children the evil spirit which possessed them and made them obstinate, by reading out of a book. The Yaos of Central Africa have in recent years come under the influence of Mohammedan tenets which they merely graft on to their still cherished belief in the old faiths of their fathers. The Koran, or a few of its texts, are added to the many other charms they have already hung about their necks.³ Fetishism is certainly implied in the notion that a holy book is the sum and source of all revelation. "Every prophet has uniformly drawn therefrom; indeed they become prophets through the holy book being made accessible to them or, as the technical expression puts it, being sent down to them. From it each of them gets insight from time to time, according as it is required, and draws out piecemeal the particular revelations which are in keeping with the time and people. This notion is highly developed in the Koran, and it significantly appears in the oldest suras."⁴

Among the Chaldæans the conjurations did not always work; the most powerful daimons were not frightened at them. But there was a power before which all on earth, both good and bad spirits, bowed and that was the authoritative god-name, "the highest name," the name of the god.⁵ How powerful was the word of a god may be seen in the ancient versions of creation. "Through the word, that is, through the magic power of his formula and the correct tone in which he spoke, created he the world."⁶ "Ahuramazda made the universe, not by the work of his hands but by the magic of his word."⁷ His living word was before all things, good or evil. "It is the will of Ormuzd"—spoken several times—vanquished Ahriman. The Parsees say that Zoroaster's living word gave back new life to the world consumed by demons. The Avesta scatters demons; like the Koran and the Bible it is a fetish.⁸ In the Middle Ages the eucharist, as ritual, was a fetish, and so was the Lord's prayer.⁹ The word "Word" became too great for common use, as it meant the Word of God, so the Romance languages adopted "parabola," or derivatives from it like the French *parole*, for "word."¹⁰ A common element of all religions is the Iaw; with the notion of the Word of God in Law fetishism becomes mysticism.¹¹

§253. The Image.

IMAGES carved in a rude likeness of a man are common in Melanesia. Codrington¹ mentions some in San Cristoval which represent a man climbing up to shoot an opossum, the animal looking down upon him from the top of the pole. "This would hardly be taken for an idol, but is as much an idol as many figures which have found their way into museums as such. The canoe-houses, common halls, public-houses, called in those parts *oha*, were full of carvings in the constructive as well as decorative parts. Some of these, the posts for example which support the ridge-poles and purlins, are often figures of men, who would be loosely called ancestors by the principal people of the village, and these would be treated with respect; sometimes food and betel-nuts would be seen laid before them. But these had no sacred character, further than that they were memorials of deceased great men, whose ghosts visiting their accustomed abodes would be pleased at marks of memory and affection, and irritated by disrespect." In the New Hebrides images of the dead whose death-feasts are to be celebrated are very elaborately prepared, not with any attempt at representing the figure of the particular deceased but in conventional form; in the same islands "drums are set up for funeral feasts with fantastic faces cut upon them, and these remain as in a manner images of the deceased, taken by visitors for idols or devil-drums." On the same islands an image of split bamboo is made to resemble the deceased warrior or chief as much as possible. "It is hollow and plastered with clay, carved wood being used to represent arms, legs, etc. The head is smeared with clay, and modelled and painted so as to be a fair likeness of the dead. It is put on the model and the whole is set up in the god's house or temple, with the weapons and small personal effects of the deceased. Probably these images are worshipped."² Whether worshipped or not, they are distinctly fetishes, as is seen by the treatment accorded them. The Savage Islanders say that a long time ago, in the time of a great epidemic, they paid religious homage to an image which had legs like a man; then, thinking the sickness was caused by the idol, they broke it in pieces and threw it away.³ Images consisting of carved posts are to be found at graves in Bathurst Island,⁴ while the large wooden figures in Papua are certainly images of ancestors.⁵

In the northern part of the Congo, when one dear to them dies, the natives make a wooden statuette to which they give the name of the deceased and which they preserve in their huts.⁶ Schweinfurth⁷ says the true object of certain wooden figures found over the graves of the Bongo and other tribes is simply to constitute a memorial of some one who has departed this life; this is proved by the term, meaning "the figure of the wife," which is applied to an image raised by a surviving husband to the memory of his deceased wife and set up in the hut as a species of Penates. Stuhlmann⁸ says there are scarcely any idols as embodiments of gods in all East Africa. West of Lake Albert he found in the grass a wooden female image which he calls a doll in memory of a deceased person. At a drought in Nigeria some liquor is thrown three times, after three incantations, on each corner of a special stone about two feet high, which is set up for the occasion in the grove and is supposed to be inhabited

ror the time by the supreme god.⁹ An African image and magical instrument is the war-drum of the Marutse: it is made of wood, painted with dark red ochre, the head being the tightly-drawn hide of a cow, with strips, still covered with hair, going around the instrument. The hairless drum-head is spotted with blood from the wounds of a boy whose fingers and toes have been cut off, as a sort of "foundation-sacrifice."¹⁰

In central Asia are big dark caves with colossal painted figures of gods, presenting an uncanny appearance.¹¹ A Korean expiatory offering consists of a bundle of straw tied with hoops of straw into the outline of the head and trunk of a man; arms and legs are fastened to the body.¹² The lamas in Tibet mix some of the ashes from a cremation with clay, making oval or circular molds, which they stamp with the image of Buddha; these are preserved in the shrines by the wayside or in the houses of the relatives. If made from the ashes of holy men, they are retained in the monasteries, where they can be purchased by the devout.¹³ Among the Palaungs, until an image of the Buddha has been dedicated, it may be treated with scant ceremony, simply as a block of stone, valuable on account of the price that has been paid for it but in no way sacred; after it has been consecrated, it must not touch the ground and no woman should lay her hand on it. "Candles are set in a row in front, then, when all is ready, the monks come from the monastery and the chief monk blesses the image, which is thenceforth considered sacred. This is called the 'life-giving' ceremony." When a person sees a snake he is sometimes terrified, and the fright makes him ill; "in such a case it is good to make a picture of a snake and then make an offering to the picture."¹⁴ Carved wooden effigies of the dead are placed above graves by the Naga and other frontier tribes of northeast India.¹⁵ In epic Hinduism "all the weapons of the heroes are inspired with and impelled by *mantras*," or charms.¹⁶ In Kafirstan female effigies are erected to the memory of the deceased one year after the funeral-ceremonies.¹⁷

Any one who visits northern India must desire to know the meaning of the little black stones under every conspicuous tree, which are so evidently set up for worship. They are said by Europeans to be of phallic origin; but if so, Hindus are no more conscious of the fact than we of the similar origin of the May-pole. Wherever one goes he finds them—by the roadsides in cities and villages, on the river-banks, or inside the entrance to a garden—wherever there is a tree that stands alone. The small stone pillar, called the *lingam*—the word meaning, literally, "symbol"—may have been taken from the bed of a stream, in which case it is likely to be of a long egg-shape. If it has been cut by the hand of man, it is short and slightly tapering, with a thimble-like top. Sometimes, in all good faith, the features of a human face have been more or less crudely marked on it, with white paint. In any case, it is only a question of time till some woman, passing by on her way from bathing, stops to pour a little water or sprinkle a few grains of rice tenderly over the head of the stone.¹⁸ Some assert that there is nothing erotic about it.¹⁹ In front of a village on the Rejang river in Borneo "there are four huge effigies, with the genital

organs as usual fully developed; no indecency is intended, [these] being merely relics of primitive worship."²⁰ In Indonesia, "under the symbol of the *lingam*—a representation, as is well known, of the sex-organs in the act of copulation—Çiva is earnestly prayed to by young maidens for a speedy marriage."²¹

The drum was a fetish in Polynesia; it was not only associated with a Tane-cult in the erotic dance, but was regarded as Tane's embodiment; "when the drum was beaten, it was Tane that was struck, and from the *kaara's* fissure it was Tane's voice that issued."²² In Samoa, Finsch²³ discovered a big figure, carved out of a stump in the ground, of a man with a crocodile on his back; this was the image of a chief ancestor. The process of consecration among the Maoris is described as follows: "Some object was selected, often a stone, and over it certain incantations were recited by a priest. This ceremony had the effect of imbuing such object with the sacred life principle of the person, persons, land, hamlet, or forest, that it represented. This object was termed a *mauri*. It was carefully concealed, its hiding place being known to very few persons. So long as the *tapu* of this object was preserved, no arts or spells of black magic could affect the persons, land, or whatever it represented. It preserved, or protected the *Hau* of such persons or lands, that is to say, the sacred life principle, the physical, intellectual, and spiritual vigour and well-being." By this process a spirit is inducted into the object, making it a fetish. Care must be taken lest the indwelling spirit desert the object, leaving it null and void: "If the concealed *mauri* of a village community were found by an enemy, he would at once pollute its sacredness, destroy its *tapu*, whereupon it would no longer possess any power to protect the folk of the hamlet, and they would be open to the attacks of the magic arts of such enemy."²⁴

Among the Eskimo the belief prevailed that "in early days all animated beings had a dual existence, becoming at will either like man or the animal form they now wear; if an animal wished to assume its human form the forearm, wing, or other limb was raised and pushed up the muzzle or beak as if it were a mask, and the creature became manlike in form and features. This idea is still held, and it is believed that many animals now possess this power. The manlike form thus appearing is called the *inua*, and is supposed to represent the thinking part of the creature, and at death becomes its shade." The induction of a spirit into an Aleut image was accomplished through certain religious dances and festivals. "During these, images or idols, temporarily prepared, were carried from island to island, and strange ceremonies, of which we have only dim traditions, were performed in the night. There were mysteries sacred to the males, and others to the females. . . . An idea prevailed that while these mystic rites were going on a spirit or power descended into the idol. To look at or see him was death or misfortune, hence they wore large masks carved from drift-wood, with holes cut so that nothing before them or above them could be seen, but only the ground near their feet."²⁵ Masks as sacred images had an important place in the religious notions of the Indians; paint rubbed from a sacred mask was regarded as efficacious in prayer, and men sometimes invoked their masks, thanking them for services rendered. By some tribes altars were formed by masks set in a row, and

sacred meal was sprinkled upon them. When a man among the Zuñi dons a mask, his body becomes the abiding-place of the spirit of the god and he is worshipped as such; hence he is expected, when chosen to personate a god, so to conduct himself that he will be worthy to fill the sacred office. With the sacred masks there were prescribed methods for consecration and handling; for instance, among the Hopi they were put on or off only with the left hand; certain masks must never be touched by pregnant women. This tribe also observed rites of bodily purification before painting the masks. In the Southwest and the extreme North, little figures were made for ceremonies in which mythic ancestors or dead relatives were recalled. Among the Hopi they are of soft cottonwood, so carved and painted as to indicate in miniature the elaborate head-dress, decorated face, body, and clothing of those who represent *kachinas* or impersonations of ancestral "breath-bodies" or spirits of men. "These dolls are not worshipped, but are made by the priests in their kivas during the great spring ceremonies as presents for the little girls, to whom they are presented on the morning of the last day of the festival by men personating *kachinas*. In this way the young become familiar with the complicated and symbolic masks, ornaments, and garments worn during tribal and religious ceremonies."²⁶

Images in form of animals or birds also were common. The Tuscarora at certain rites raised "three wolf's hides, figuring as many protectors or gods," to which offerings, consisting of their jewels, were made by the women. "In the middle of the circle, the chief shaman performed all manner of contortions, conjurations, and imprecations against the enemies of his country, while the populace danced in a circle around the wolf-hides." A chief of the Mohawks in 1634 showed a European his idol: "it was a head, with the teeth sticking out; it was dressed in red cloth. Others have a snake, a turtle, a swan, a crane, pigeon, or the like for their idols, to tell the fortune; they think they will always have luck in doing so." When the traveller, Van Curler, visited the town of Oneida, he saw a chief's grave at the entrance of which was a "big wooden bird, and all around were painted dogs, and deer, and snakes, and other beasts." Over the gates in the ramparts of the village were three wooden images, like men and adorned with scalps.²⁷ A human figure or idol has been found in the mounds of the Mississippi valley.²⁸ A special fetish of the Dakotas was made by using a grooved stone hammer as the head, with a withe tied about the middle of the hammer and the handle wrapped with buckskin or raw hide. "Feathers attached bear mnemonic marks or designs, indicating marks of distinction, perhaps fetishistic devices not understood. These objects are believed to possess the peculiar charm of warding off an enemy's missiles when held upright before the body. . . . Properties are attributed to this instrument similar to those of the small bags prepared by the Shaman, which are carried suspended from the neck by means of string or buckskin cords."²⁹

One tribe in Mexico copied Cortez's horse in stone and added it to their idols.³⁰ Catholics in name, the Mayas of Yucatan in fact prefer to render homage to any stone figure that once ornamented the temples of their forefathers. "We have seen one, kept in a cavern underground, that served as a personification of Balam, for it represented a man with a long beard, and to it they make offerings of corn. . . . This statue is now black, owing to the

incense and candles with which its devotees smoke it. Previous to sowing grain they place before it a basin of cool beverage made of corn, also lighted wax candles and sweet-smelling copal, imploring the god to grant them an abundant harvest. When the crops ripen the finest ears are carried to the smoke-begrimed divinity by men, women, and children, who within the cavern dance and pray all day long, some of their quaint instruments serving as accompaniment to the Christian litanies which they chant without having the vaguest idea of their meaning."³¹ The idols in Guatemala and San Salvador are fungiform: the figures consist usually of three different parts; a base, a nearly cylindrical middle body upon which are incised the face and parts of the body of a man, and a hat-shaped nearly round upper segment.³² The Indians who accompanied Von Martius³³ on his travels in Brazil once encountered upon a granite rock five figures with human heads, which they approached with awe, while they cried out "*Tupána*" (god). Schomburgk had the same experience with some Guiana Indians. The tribes of the Amazon "all worship Idols which they make with their own hands; to one of them they ascribe the authority of governing the waters, and put a fish in his hand in token of his power; they choose others to preside over their seed time, and others to inspire them with courage in their battles; they say these gods came down from Heaven on purpose to dwell with them and to show them kindness. They do not signify their Adoration of these Idols by any outward ceremonies, but on the contrary seem to have forgotten them as soon as they have made them, and putting them in a case let them lie, without taking any notice of them so long as they imagine they have no occasion for their Help; but when they are ready to march out to war, they set up the Idol in which they have placed the hopes of their Victories, at the Prow of their Canoes: so, when they go a fishing, they take that Idol with them to which they attribute the government of the waters."³⁴

The ancients held that a spirit could be induced to enter the statue of a king or god, which would then speak as an oracle. According to Chaldean theological doctrine, the statues in the temple were transubstantiated by consecration into the body of the divinity. The sovereign who dedicated them adjured them to speak in the days to come. "When they were interrogated according to the rite established for each one of them, the portion of the celestial spirit which had been drawn into them by virtue of prayers, and which was there kept captive, could not help but reply." Some of them perhaps were articulated, like those of Egypt, and movable by cords drawn by the prophet. A statue cut in stone could not have enjoyed sacrifices of food, but at its consecration its mouth was opened by a ceremony like that which was called opening the mouth of a mummy or statue of the dead. After that it could enjoy food and drink. The Chaldean theory of animated and prophetic statues was the same as the Egyptian. A god could distribute his divine spirit among any number of men, beasts, statues, or natural objects. This is the sense of the apparent animal-worship. Without losing any of its religious significance, the statue later became an object of art in the sense that one admired it not only for its mystic utility but also for the way in which the sculptor interpreted his model.³⁵

The Old Testament, despite the fact that the representation of Jahweh by any figure is strictly forbidden, is rich in idolatry—and even though a curse is pronounced on the making of a graven or molten image by the hands of a craftsman.³⁶ Here, as in the Decalogue, the reference is to every species of divine image, including that of Jahweh. Presenting one's self at the sanctuary is spoken of as "beholding the face of Jahweh," which expression certainly referred originally to looking upon the image of the deity. As images of God we must reckon not only the very ancient *pesel* or carved image and the bull-figures (prohibited in Judah), but also the *ephod* and the *teraphim*. There are many passages in which *pesel* means an image of Jahweh, and such a carved image appears to have been for long regarded as unobjectionable, whereas the molten image (probably with allusion to Israel's bull-worship) is already prohibited. "Even if the prohibition of the *pesel* in the Decalogue³⁷ . . . extends to images of Jahweh, this would be simply proof that the Decalogue (or at least the prohibition of images) originated later than J—a conclusion which is favoured by the circumstance that there were also other species of images of Jahweh which, till far into the monarchical period, continued to be revered without opposition, or at least to be employed as a means of obtaining Divine oracles." The *ephod* and, at least from the monarchical period, the *teraphim* as well, were images of Jahweh, and were regarded as quite unobjectionable in the pre-Prophetic period, nay, even as late as Hosea,³⁸ but at last they were involved in the same condemnation as images of idols proper. The golden bulls set up by Jeroboam at Bethel and Dan were intended as images of Jahweh, and not as heathen images. "It might appear otherwise from the language of the Chronicler,³⁹ . . . but the truth was still quite evident to the Deuteronomic redactor of the Books of Kings.⁴⁰ . . . In like manner the narrative of Exodus,⁴¹ . . . which belongs to the older sources of the Pentateuch, is quite aware that Aaron meant to represent Jahweh by the golden calf which had brought Israel out of Egypt, for he makes him . . . proclaim a feast to Jahweh. But even here the giving of this form to Jahweh is looked upon as a grievous offence on the part of Aaron."⁴²

What kind of object was the *ashera*, which is translated in the King James version as "grove"? From one passage⁴³ it appears to have been either a living tree or a tree-like post; every altar had its *ashera*, even such altars as in the popular, pre-prophetic forms of Hebrew religion were dedicated to Jehovah. It is a thing made by man's hands, an image, a "grisly object."⁴⁴ "These expressions may imply that the sacred pole was sometimes carved into a kind of image. That the sacred tree should degenerate first into a mere Maypole, and then into a rude wooden idol, is in accordance with analogies found elsewhere, e.g., in Greece; but it seems quite as likely that the *ashera* is described as a kind of idol simply because it was used in idolatrous cultus." It would seem that later the *ashera* is taken as a symbol of the goddess Astarte, the Asherim being regarded as the female partners of the Baalim: "And the children of Israel did evil in the sight of the Lord, and forgot the Lord their God, and served Baalim and the groves." The pentateuchal law looks on the

use of sacred pillars as idolatrous.⁴⁵ "This is the best evidence that such pillars had an important place among the appurtenances of Canaanite temples, and as Hosea⁴⁶ speaks of the *masseba* as an indispensable feature in the sanctuaries of northern Israel in his time, we may be sure that by the mass of the Hebrews the pillars of Shechem, Bethel, Gilgal and other shrines were looked upon not as mere memorials of historical events, but as necessary parts of the ritual apparatus of a place of worship." It seems clear that the altar is a differentiated form of the primitive rude stone pillar, the *nosb* or *masseba*; but the sacred stone is more than an altar, for "in Hebrew and Canaanite sanctuaries the altar, in its developed form as a table or hearth, does not supersede the pillar; the two are found side by side at the same sanctuary, the altar as a piece of sacrificial apparatus, and the pillar as a visible symbol or embodiment of the presence of the deity, which in process of time comes to be fashioned and carved in various ways, till ultimately it becomes a statue or anthropomorphic idol of stone, just as the sacred tree or post was ultimately developed into an image of wood." At the time when the oldest of the pentateuchal narratives were written, the Canaanites and the great mass of the Hebrews certainly treated the *masseba* as a sort of idol or embodiment of the divine presence. "Moreover Jacob's pillar is more than a mere landmark, for it is anointed, just as idols were in antiquity, and the pillar itself, not the spot on which it stood, is called 'the house of God,'⁴⁷ as if the deity were conceived actually to dwell in the stone, or manifest himself therein to his worshippers." Melcarth was worshipped at Tyre in the form of two pillars; twin pillars stood also before the temples of Paphos and Hierapolis, and Solomon set up two brazen pillars before his temple at Jerusalem.⁴⁸ As he named them "The stablisher" and "In him is strength," they were doubtless symbols of Jehovah.⁴⁹

Says Barton:⁵⁰ "These objects, whether called *nosbs* or *massebas*, or by whatever name, were in general in the form of rude phalli, and were no doubt chosen as the symbol of Semitic deity because of their resemblance to the organ of the god of life." Such objects have been found in many places and among many peoples. It seems certain that the phallic pictures on vases, statuettes, and the like were not made to gratify obscene propensities; either they were not regarded as obscene and were not noticed any more than we notice exhibitions of face or feet (the face is obscene in Mohammedan countries, and the foot in China) or from ancient usage the exhibition was covered by the convention which justifies the archaic, religious, or theatrical.⁵¹ In the Norse sagas are mentioned figures of gods carved out of the posts of the house-father's seat of honor;⁵² while a survival of the image-fetish is to be seen in the agricultural districts of England and Scotland where, during the harvest rejoicings, they use an image called the kern-baby, crowned with wheat-ears and dressed up in finery, with colored ribbons. In the north of

England, at harvest time, these figures are made of oats; they are elaborately decorated and set on top of the dresser.⁵³

§254. The Extraordinary.

The Extraordinary in General. We begin with a miscellaneous list of oddities, natural and artificial, but always inexplicable except by reference to an indwelling spiritual presence. There is a good deal of difference between throwing a spear by hand and throwing it by means of a throwing-stick, like the Australian *murriwun*. "The blackfellow perceives that the *murriwun* gives the spear a surprising impetus, and not being able to explain its mechanical action, he considers that it is magical. This is a good instance of the manner in which the aboriginal mind works."¹ It is customary to refer the strange and unusual to the ancestral ghosts. The reverence paid by the Australians to their *mooras* or ancestors is largely the reverence of fear, and "anything strange or unusual is set down to them. The Aurora Australis in this way creates great alarm, and to appease the *moora* indiscriminate intercourse is practised." Stones often appear to commemorate the death or disappearance of a *moora*; "trees sometimes spring and seem to have grown up where the *moora* first came or last went." So-called *mooras'* toe-nails were given to the author.² To him they were implements of various sorts, of semi-transparent chalcedony not found within 200 miles of these particular people, by whom, as unfamiliar, they were ascribed to the *moora*. There is a large body of magic among the Melanesians which is essentially popular in character; standing as it does in relation to the daily recurring wants of the people, it is practised to a greater or less extent by every adult. "The magical element consists in the employment of certain natural objects, immanent in which is a virtue communicable under appropriate circumstances to certain objects with which the first series of objects are brought into mediate or immediate contact." The qualities which lead to a natural body being recognized as a suitable charm, that is, as capable of exercising a beneficial effect on a particular class of objects, are generally (a) similarity in contour, or in other qualities, to the object to be influenced, or (b) rarity, or (c) unusual shape in not very uncommon objects.³ Anything may fall into the category of *imunu* or religious objects: hunting-charms, old relics, grotesque carvings, freaks of nature. But such a list does not by any means exhaust the *imunu* class. "It appears that an exceptionally large tree might be thought to be the home of an *imunu*. Similarly the vast rivers of the Delta are in some way frequented by many *imunu*. But I cannot say that I have ever heard of an *imunu* as wholly immaterial: there has always been some material object with which it is identified."⁴

Nearly all the natives of Borneo make use of charms, and many will not go on a journey without taking some with them as a protection against any perils which they may encounter. "Any object of unusual shape, or one which is at all uncommon, is regarded as a charm. Among those which I have seen in use," writes Evans,⁵ "are quartz crystals, shiny black river pebbles, curiously shaped pieces of wood, rhinoceros teeth, fossil shells, and ancient stone implements. Belts of cloth or string network are frequently made to contain

such charms as the owner may wish to wear on his person, and each of these is sewn or netted into a small compartment separate from the others. Stone implements are, among the Dusuns, chiefly used as charms to keep their padi in good condition." Among Samoan household-gods were twins of the Siamese type. "Everything *double*—such as a double yam, two bananas adhering, etc.—was sacred, and not to be used under penalty of death."⁶ Many moderns seem to share the primitive notion that there is something fetishistic about oddities found in nature. At the American Museum of Natural History there is a "fairy cross" of pyrite, the "cross" being formed by crystallization and, according to the superstitious, making of the mineral a good-luck charm. "There are probably very few people who know that nature has conferred upon one of her minerals a fairy cross that is sought after by collectors of minerals with all the zeal that actuated the 'forty-niner' in his quest for gold," says an announcement from the museum. "The mineral known as pyrite, or iron pyrites, which is a sulphide of iron, under certain conditions actuated by the mysterious force of crystallization, produces double crystals that are so placed with respect to each other that their prominent edges form a veritable cross. . . . But iron pyrites is not the only mineral that makes its crystals in the form of crosses. In some parts of Virginia and Georgia one hears much of the 'fairy stones' which are plowed up in the fields or found on the surface of the ground after a rainstorm. They are esteemed to bring more luck to any one who wears them than the proverbial rabbit's foot, and numbered among the converts to this particular form of mascot was the late President Roosevelt, who wore one on his watch chain. These odd shaped stones are in reality crystals of the mineral staurolite, a somewhat uncommon silicate, present in rocks in a number of places, of which Patrick County, Va., and Fannin County, Ga., are two. Like the iron crosses of iron pyrites, they are twinned crystals formed by the intersection of two, occasionally three, simple crystals. Sometimes these cross at right angles, making a very symmetrical cross, or again they may intersect at a steep angle, forming a St. Andrew's cross."⁷

These general illustrations may serve as typical of the great variety of fetish-objects that fall under a classification of the extraordinary, and to them must be added such objects as have demonstrated connection with spiritual powers because they have brought luck. They can control the aleatory element.

To weapons that have been successfully used, as well as to unusual devices like the boomerang, is often attributed fetishistic quality. The Australian boomerang is a remarkable construction, serving not only as a weapon but as a poker and shovel and as a general implement; some, especially old ones, are tied up with a person's luck.⁸ The Bushmen despise an arrow that has once failed of its mark, and, on the contrary, consider one that has hit as of double value. "They will, therefore, rather make new arrows how much time and trouble soever it may cost them, than collect those that have missed and use them again." Similarly other tribes attach a special value to a hook that has caught a big fish.⁹ On the Loango coast the thief makes a fetish for success in stealing: if he succeeds, that proves it a good one; if caught, that it was a failure.¹⁰ The arrow-dance of the Veddahs of Ceylon was regarded as a

mechanical means of getting luck in hunting and protection against wild animals; the arrow was venerated as a fetish.¹¹ To the warrior of the American Plains the shield constituted a most sacred possession from the time when it was made for him, or given to him soon after his first encounter with the enemy, until it was laid under his head in the grave, unless before that time bestowed on some worthy younger warrior or left as a precious sacrifice at the grave of wife or child. "Every shield originated from a dream, in which the dreamer was told by the spirit how many shields he might make, how they must be painted and decorated, how the owner must paint and otherwise decorate himself and his pony, and what taboos and other sacred obligations he must observe through life in order to obtain the protection of the shield spirit, which might be a bird, a quadruped, a being of the tribal pantheon, or one of the personified powers of nature. The owner rarely made his own shield, but received it from the dreamer, usually an old warrior or recognized medicine-man, who made it on request as he had been instructed, for a definite compensation in horses, blankets, or other property."¹² In no country has the sword been an object of such honor as in Japan, where it was "a divine symbol, a knightly weapon, and a certificate of noble birth."¹³ As among some Germanic tribes, so among the Scythians, the god was set up in the form of a sword. "The sword received sacrifices of horses and sheep, as of prisoners of war whose blood was caught in a vessel and sprinkled on the sword."¹⁴ A Bosnian song relates how a woman tells a man not to go back for his gun which he has left; she has gold and will have a gold gun made for him; to which he replies: "I know that thou hast gold and canst have a better gun made, but not with the luck of my own gun." The hero's gun is alive: he complains to it of his troubles, he adjoins and curses it; when aiming he calls on it not to fail him, being sure of his eye but not of it.¹⁵ In the west of Ireland, flint arrow-heads are regarded with great superstition; "They are supposed to be fairy darts or arrows, which have been thrown by fairies, either in fights among themselves or at a mortal man or beast." At Bantam, the western province of Java, there is a cannon, a relic of the Portuguese occupation in the sixteenth century, which is supposed by the natives to possess those medicinal virtues identified in advertisements with certain German spas. In Batavia there is another cannon thought to be of the same origin. "The Javanese belief is that when these two cannon meet the Dutch rule will vanish. It is said to be due to the watchfulness of the Dutch Secret Service that a few days before the revolt broke out [late in 1926] the cannon were strongly guarded in order to prevent their removal. This precaution is also believed to have taken the heart out of the [communist] movement at its inception."¹⁶

The Whirr-stick and other Sacred Objects. A special type of fetish which is illustrative of the extraordinary is the bull-roarer or rhombus, the whirring or humming stick. In ancient Greece, modern Australia, North America, and Africa the instrument is one of sacred purpose. Only in certain civilized countries has it degenerated into a boy's plaything. The word itself is good English, signifying the flat strip of wood fastened to the end of a string—an instrument which has had a high mystic import in the barbaric and ancient

world. The Australian bull-roarers are generally made of a thin piece of wood, but sometimes of bark, and are of different sizes, varying in width from less than an inch to as much as four or five inches, and differing in length from four inches to two feet or longer. Both sides of the instrument are generally convex, with a small hole at one end, through which is fastened a string made either of the bark of trees, native flax, the fur of animals, or human hair, and sometimes as much as a dozen feet long. When whirled, it makes a loud humming noise.¹⁷ This instrument is used with dread mysterious effect in the initiation-ceremonies. Until a boy is initiated he must not see one, and it is usually taboo to women. It is thought by the Dieri that if a woman were to see a bull-roarer which had been used at the ceremonies, and know the secret of it, the tribe would lack such food as snakes and lizards.¹⁸ According to the Kurnai the sacred humming instrument, invented first by the Great Head Spirit, has kept its place among the magical apparatus of the wizard and is regarded as the means by which he, as also the dead, reaches ghost-land.¹⁹

As the bull-roarer is too well known in the Banks Islands to be used in mysteries, a different apparatus productive of the same effect is employed. This is a flat, smooth stone, on which the butt-end of the stalk of a fan of palm is rubbed. "The vibration of the fan produces an extraordinary sound, which can be modulated in strength and tone at the will of the performer, and which proceeding in the stillness of daybreak from the mysterious recesses of the *salagoro* [secret society clubhouse], may well have carried with it the assurance of a supernatural presence and power."²⁰ Among the Papuans the bull-roarer is a taboo-instrument of religious significance at the initiation-ceremonies. In the district around the Gulf of Papua it may be seen only by men after manhood, and then pigs and much food have to be provided. "When the day comes for the feast and the introduction, the roaring bull may be heard from two in the morning and on until sunset. The day before, all females and young people have left the village lest they should hear it and die."²¹ Extreme care is taken during the initiation-ceremonies to see that the instrument is not broken. "Should one break and a chip strike anyone, that person when next he goes hunting or fighting will be wounded by a boar's tusk or spear, as the case may be, in the place where he was struck by the bullroarer. There is absolute belief in this, and one or two men have marks to show where they have been struck by a bullroarer and afterwards gored by pigs. . . . The underlying idea about the bullroarer is that it is a spirit that makes the noise, and this belief is strongly impressed by every device upon uninitiated women, children, and those who have not passed through the ceremony. This belief will usually be found wherever the bullroarer is used in Papua."²²

A Torres Straits sorcerer who wanted to raise a wind would cut out a piece of wood shaped like a bull-roarer, but made very thin. "This he attached to a piece of string and whirled around. The vibrations and revolutions were so rapid that the instrument was invisible. If more wind was desirable, he climbed to a tree-top and performed."²³ This recalls the Kaffir superstition that playing

with the rhombus invites a gale of wind. "Men will, on this account, often prevent boys from using it when they desire calm weather for any purpose." The superstition is identical with that which prevents many sailors from whistling at sea.²⁴ The natives on the Loango coast hear in the sounds produced by the whirring stick the voices of departed spirits, while among the Yoruba the supposed "voice of Oro" proceeds from a small piece of wood, actually worshipped as a god.²⁵

The "whizzing-stick" was often used in the religious ceremonies of the Point Barrow Eskimo.²⁶ The bull-roarer was a very common instrument among the Indians, especially in the West, and while in some tribes it was merely a child's toy, usually it was regarded as a sacred implement, associated with rain, wind, and lightning, and among the Kwakiutl with ghosts.²⁷ Bourke²⁸ first saw the rhombus at the snake-dance of the Tusayan in Arizona: "The medicine-man twirled it rapidly, and with a uniform motion, about the head from front to rear, and succeeded in faithfully imitating the sound of a gust of rain-laden wind. As explained by one of the medicine-men, by making this sound they compelled the wind and rain to come to the aid of the crops." Later he found it in use among the Apache, and for the same purpose. "The Apache explained that the lines on the front side of the rhombus were the entrails and those on the rear side the hair of their wind god. The hair is of several colors, and represents lightning." He was led to believe that the bull-roarer of these people was made by the medicine-men from the wood of a pine or fir that had been struck by lightning on the mountain-tops. Apache, Hopi, and Zuñi bull-roarers bear lightning-symbols, and "while in the semi-arid region the implement is used to invoke clouds, lightning, and rain, and to warn the initiated that rites are being performed, in the humid area it is used to implore the wind to bring fair weather." The Hopi, who regard the bull-roarer as a prayer-stick of the thunder and its whizzing noise as representing the wind that accompanies thunderstorms, make the tablet portion from a piece of lightning-riven wood and measure the length of the string from the heart to the tips of the fingers of the outstretched right hand. The Navaho make the bull-roarer of the same material but regard it as representing the voice of the thunder-bird, whose figure they often paint upon it, the eyes being indicated by inset pieces of turquoise.²⁹ It is called by them "groaning stick" and they say that "the sacred groaning stick may only be made of the wood of a pine tree which has been struck by lightning."³⁰ The bull-roarer was used in religious mysteries, as among the Moqui, where in front of the procession of dancers, each with a live rattlesnake or two in his mouth, the priest walked whirling this instrument.³¹ It was known, further, to tribes in Mexico and Central America, while in Brazil it seems to have been connected with funeral-rites and the notion was held that women and children must not see it lest they die.³² A favorite fetish-instrument of the Guiana Indians was the sacred trumpet, which was sounded under the palm-trees that they might bear abundance of fruit.³³ In the mysteries of the Greeks the rhombus was whirled as in

the barbaric religious ceremonies; like the drum or tympanum, this instrument of the cult served to inflame the ministers and worshippers to the highest pitch of enthusiasm.³⁴

A host of other extraordinary objects were regarded as fetishes by the aborigines of the New World. Among the Tlinkits charms are worn to ward off evil, and certain things are kept to bring good luck. "A woman has kept for years a lot of halibut bones taken from a halibut that was mysteriously caught by a native. The old woman would not part with these bones for anything."³⁵ The Micmac accorded supernatural powers to certain of their bowls, and thought that water standing over night in gaming bowls would reveal by its appearance past, present, and future events. Some bowls were supposed to have mysterious powers which would affect the person eating or drinking from them. Among the Pueblo tribes the pottery bowl, like the basket-bowl drum of the Navaho and others, is frequently a cult-vessel employed in religious ceremonies, the medicine-bowl with its nature symbols and the sacred meal-bowl furnishing familiar examples. Such vessels are sacrificed to springs or are deposited in shrines and caves.³⁶ This is paralleled to some degree by the D'Entrecasteaux belief that the greatest ruler of the winds and rain and sunshine was an ancient pot, which was kept in a special hut and once a year carried by its owner in a religious procession; a train of natives followed after, "crouching low towards the ground. In fear and trembling they brought it food, still crouching low, and hurriedly retired again."³⁷ The Cherokee sacred box was a rectangular affair, about three feet long, covered with a dressed deerskin and resting upon blocks to keep it from the earth. "It was watched by a sentinel with bow and arrows, who drew an arrow to the head and warned the stranger away when he attempted a closer inspection." The "flat pipe" of the Arapaho was kept by a priest, together with an ear of corn and a stone turtle, all of which, according to their tradition, they have had from the beginning of the world. "Around these centers the tribal genesis tradition, which is recited when the package is opened, as may be done on special occasions. . . . The box in which the sacred objects were kept was never allowed to touch the ground, and when on the march the priest in charge, even though mounted, was not allowed to rest it upon his horse, but must carry it upon his own back." The sacred metal plates of the Creeks were kept by priests in a depository on one side of the public square; at times they were said to give out a miraculous ringing sound without being touched. "Once a year, at the annual Green Corn dance, they were exhibited to the people from a distance, after which they were washed in the stream, rubbed and cleaned, and put away for another year." As usual with such objects, the people claimed to have received them from a supernatural being at the beginning of their existence as a people.³⁸

Similar to the above was the sacred hat of the Cheyenne, made of a buffalo-cow's head and kept by special guardians whose office was hereditary. "The man who held the office was never killed or even wounded in war; nor was he ever sick, but lived to full age, dying at last nearly a hundred years old. His lodge had a sacred character, and in the old formal days certain rules were observed in it. . . . A person was not permitted to stand up in the hat lodge;

38 Mooney, in HAI, II, 194.

he who entered must walk to his place and sit down without delay. No one must speak in a loud voice. Low tones must always be used. A child brought into this lodge for the first time must be prayed over and warned to speak in a low voice. . . . If by a mischance anyone should throw against the lodge a little stick or stone he must be taken into the lodge and prayed over, and hands that had been placed on the earth should be passed over his body on both sides. An enemy who entered this lodge might not be harmed. He was safe—as safe as if in his own home. In this lodge certain things were forbidden. No moisture might fall on the floor. No one might throw water on the floor nor spit on it, nor blow his nose with his finger there. Any of these things would cause a heavy rain-storm.” Many other taboos are mentioned, the infraction of which involved various evil consequences. The hat was shown only on the occasion of a great sickness, or when the medicine-arrows were renewed, or when it was taken out to be worn in war. In the first case it was exhibited in the lodge, which was thrown open, the people entering from the south side, passing around and out at the north. “As the people passed by the hat, they made their prayers and passed their hands over it, and then over their children.” In olden times, when the camp was moving, the wife of the keeper of the hat walked carrying it on her back, for the hat might neither be carried on a horse nor hauled on a travois. “When the lodge in which the hat was kept had once been pitched, it was not permitted to move it. If it was found necessary to move this lodge, then all the lodges must be taken down and the whole camp must pack up and move, even if the new location were not more than a few hundred yards away.”³⁹ Another special fetish, though not of the same magnitude as the Cheyenne hat, was “the sacred string of beads with which Tecumseh’s brother, the Shawnee prophet, traveled among the Indian tribes, inciting them to war. Every young warrior who agreed to go upon the warpath touched this ‘sacred string of beads’ in token of his solemn pledge.”⁴⁰

The most profoundly sacred object of the Indians was the calumet. From its uses it would seem that it had a ceremonially symbolic history independent of that of the pipe, and that when the pipe became an altar by its employment for burning sacrificial tobacco to the gods, convenience and convention united the already highly symbolic calumet-shafts and the sacrificial tobacco-altar, the pipe-bowl. “As the colors and the other adornments on the shaft represent symbolically various dominant gods of the Indian polytheon, it follows that the symbolism of the calumet and pipe represented a veritable executive council of the gods.”⁴¹ Marquette⁴² said of the calumet: “It is the most mysterious thing in the World. The Scepters of our Kings are not so much respected; for the Savages have such a Deference for this Pipe, that one may call it The God of Peace and War, and the Arbiter of Life and Death.”

A fetish that plays an important rôle in Tibetan life is the *khata* or scarf of felicitation. This is a piece of silk nearly as fine as gauze, of bluish white color and about three times as long as wide. “There are *khatas* of every size and price; for it is an object that the poor as well as the rich cannot do without. No one ever goes anywhere without carrying a small supply of them with him. When one pays a formal visit, when one has a service to ask of some one, or to thank a person, the first thing to do is to unroll a *khata*; it is

42 Quoted by Hoffman, in BAE, VII, 153.

taken in both hands and offered to the person one wishes to honor. If two friends, not having met for some time, suddenly run across each other, the first thing they do is to offer each other a *khata*. It is done with as much *empressement* and as promptly as one shakes hands in Europe. It is also customary when one writes a letter to fold up in it a little *khata*. It is incredible what importance the Tibetans, Si-Fan, Hung-Mao-Eul, and all the people living to the west of the Blue Sea attach to the *khata* ceremony." Besides these everyday uses, the *khata* is the most ordinary form of offering to the gods. "Hundreds and thousands of them are suspended on the statues of the gods in every temple or shrine in Tibet and Mongolia." Ceremonial scarfs appear at one time to have been in use among the Chinese, while a similar custom existed in India in olden times, for we read in early Buddhist works of a piece of light stuff being put over the shoulders or around the neck of an honored person.⁴³ The Parsees wear the girdle as an indispensable symbol of their religion; it is formed of seventy-two fine woollen threads twisted together.⁴⁴ In the *Iliad*, Aphrodite gave Hera her belt (*cestus*) containing her blandishments; from this fetish came the power of love, desire, and seductive speech.⁴⁵

The Extraordinary in Inanimate Nature. Stones of one sort or another are fetishes, as we have seen, throughout the entire world. This applies especially to those which are out of the common. The notions regarding stones and the uses to which they are put make interesting reading. The Australians who attribute anything out of the ordinary to magic are always on the lookout, while hunting or travelling, for any stones of unusual shape. "If any were found that were small enough to carry home, they were taken and shown to the assembled old men. These invariably identified the stones as something to do with the moora [ancestors], and usually invented a use for them. If the stones were too big to shift they were also accounted sacred, and in the course of time legends sprang up about them." The authors⁴⁶ mention a case where an obsidian that had been picked up was called emu's eyes; it was supposed to have magical effect on that bird, making it go blind. As soon as possible after a tree has been struck by lightning some blackfellow will dig around the roots to get what he calls the lightning-stone. Any find of an unusual shape is carefully treasured and is thought to bring good luck. Here is illustrated one of the inconsistencies of the blacks: "They are horribly afraid of lightning and will on no account use the wood of a tree that has been struck. But they value the stone that is to them the visible sign of the lightning."

Sacrificial stones are quite common in Melanesia: one on Tikopia Island, to which the people pray, is thought to be of very great virtue; it is male, be it noted; there is also a female stone.⁴⁷ Inside a sacred enclosure on San Cristoval, is a smooth, round, highly polished black stone, compared by the natives with a cannonball. Like the Kaaba at Mecca it is an object of worship. In another place on the Solomon Islands the sacrificial stone is a large block of red jasper. "The priest was said to be able to make this stone float in the water, and it certainly was very sacred, for if the man's shadow fell upon it, he would waste away."⁴⁸ When Jenness and Ballentyne⁴⁹ were watching

a meteor fall, a native with them made the remark: "The *badibadi*, they fly about, they settle here and there, they wander about in the sky." When they asked him why they fly about, they received the tantalizing reply: *kaiwa*, "I wonder." The more or less active volcano, Mt. Victory, on the northeast coast of New Guinea, is by surrounding natives reputed to be the abode of *dirava*, ghosts; "it is said that the steam rising from its top is the smoke of the *dirava* village."⁵⁰

On a mountain in Nyassaland is a sacred stone; the natives leave old hoes there with the idea that rain may follow.⁵¹ From being merely commemorative of some particular act or occurrence, many stones in Madagascar have become sacred objects and instruments of a cult which is practised even at the present time, especially by women desiring children or an easy delivery during child-birth, and who, having rubbed the stone with grease, rub themselves against it. "When either men or women desire the curing of an illness, or success in some undertaking, they throw fine gravel at the greasy part of the stone, and, if it sticks there, hope for success, or they try to throw a stone so that it lodges on the narrow top of the menhir; if after this their wishes are gratified they bestow another coat of grease on the stone."⁵² The Niam-Niam worshipped stone hatchets or wedges.⁵³ Among the Fan, anything hit by lightning becomes a powerful fetish and may enter into the war-fetish to turn aside bullets and arrows.⁵⁴ In West Africa, as elsewhere, the fact that siliceous stones actually produce a flash when struck, gives a key to the widespread belief that flint implements are thunderbolts.⁵⁵

In India, celts—called by the natives "toad-axes"—are believed to be thunderbolts fallen in a flash of lightning. The real essence returns to heaven, the mere husk remaining on earth. "The possession of celts is not, as a rule, so highly prized by Semas as by Angamis. The Sema who finds a celt, however, does not (like the Lhota) refuse to touch it. He always keeps it and believes that it causes fertility to his beans and possibly to his other crops of minor importance." Stones among these tribes are the subjects of some beliefs which are, from the civilized point of view, decidedly radical: their idea is that stones can breed, begetting and conceiving offspring. "A black stone about 18 inches long, picked up in the fields at Natsimi somewhere about the year 1906, had (in 1912) acquired a regular cult. It has an interpreter who communicates with it in dreams, in which it appears as a human being, the stone itself being said to walk about in human form by night. . . . The number of pice collected from its devotees by this stone is considerable, and, though he stoutly denies it, the stone's 'dobashi' no doubt disposes of them, while he gives out that the stone itself removes them by night."⁵⁶ The Todas have many stones which may be held to have some degree of sanctity; certainly many hold their place in the religious ceremonial. "All these stones have names, either general or individual, but two stones with the same name need not necessarily have the same function."⁵⁷ Some serpents of a very poisonous kind, think the Singhalese, contain luminous stones which they vomit up at night to give them light. Since it is impossible for them to live without these jewels, their

possessors never go far away from them. A luminous stone is borne by certain lizards, which may be recognized by their possession of two tails.⁵⁸ All these beliefs are natural enough among peoples who are ready to explain all kinds of occurrences not understood by them by reference to the influences of some spirit or saint. It is thus that the spirals of sand, known as dust-devils in the Punjab, are supposed to contain within them a sprite known as Bhai Pheru, or Brother Twirler.⁵⁹

Two oblong smooth stones stood on a raised platform in one of the Samoan villages: "They were supposed to be the parents of Saato, a god who controlled the rain. When the chiefs and people were ready to go off for weeks to certain places in the bush for the sport of pigeon-catching, offerings of cooked taro and fish were laid on the stones, accompanied by prayers for fine weather and no rain."⁶⁰ A sacred stone of the Maoris is gifted with the power of locomotion, for if any person shifts it away it will return itself to its former position. A bold ridge which stretches out toward Lake Rotorua is a lightning-mountain of great *mana*. "It is regarded by the Arawa as a place of omen, and it is moreover *tapu* because of the fact that in the rocky caves and recesses on its face lie the bones of many generations of the people." When two flashes of lightning are seen above the bluff in quick succession, like the opening and closing of one's hand, then a young chief of the tribe will quickly die. Should three or more bright flashes be seen in quick succession, an aged man is called for by the gods and will presently pass to the spirit-land. In the Wairau district is a fetish-lake which was formerly a famous place for bird-snaring, but a thoughtless act led to its being lost forever to the Maoris. Being a *tipua*, or goblin, naturally it was necessary to treat it with great respect, and a famed chief of old told his wife to be very careful and not pass before him or near the lake with cooked food. "But that foolish woman did one day so pass before him carrying some cooked food, with the result that the demon lake concealed itself, and no man has ever since been able to find that pond or its prized bird-snaring trees. Now you can see what trouble a woman can cause."⁶¹

Among the Eskimo a very necessary article of trade, soapstone, is manufactured into lamps and pots. This is "bought" from the rock; that is, having dug out a piece, the natives feel they must give the rock something in return, for example, ivory carvings, beads, or food.⁶² This is similar to the practice of the Indian medicine-man in putting a bead in each hole made by pulling up by the roots some medicinal herb, "as compensation to the earth for the plant."⁶³ Plummet-shaped implements to which mysterious properties were assigned were common to the Indians of the Pacific Coast, and were thought to possess magical power over fish and game. They were used by being suspended by cords from the ends of poles, the butts of which were planted in the bank in such a manner as to leave the stones suspended over the water where the Indians intended to fish. At other places they were hung in the mountains at points favorable to hunting. The Napa Indians said that they were sometimes laid upon ledges of rocks on high peaks, with the belief that, owing to their peculiar form and some occult power which they possessed, they

travelled in the night through the water to drive the fish up the creeks to favorite fishing-places, or through the air to herd the game up toward certain peaks and chosen hunting-grounds. The peculiar pear-shape was given them in order that they might cleave through the air or water the more easily. They were used also as war-charms or were supposed to travel about at night to worry the enemies of the tribe. Among others of the American Indians bird-stones, banner-stones, and boat-stones had uses in religious ceremony or magic; when worn by women, the bird-stones symbolized the brooding bird.

The Pueblo tribes had for war and hunting numerous fetishes of stone, small figurines cut to resemble various predatory animals, with eyes of inlaid turquoise; one or more arrow-heads were bound at the back or side and smeared with frequent oblations of blood from the slain game. A Cherokee hunting and divining fetish consisted of a transparent crystal which its owner kept wrapped up in buckskin in a sacred cave and occasionally fed by rubbing over it the blood of a deer. In some cases knives of obsidian were not properly knives, but jewelry for sacred purposes, passing current also as money.⁶⁴ Along the Mexican border loadstone is called "living stone"; in order that its action shall be efficacious, the natives believe it must be put into water every Friday, and then supplied with steel-filings. If hidden in the tresses of a girl one loves, the loadstone will draw one to her.⁶⁵ The rites of different Mexican divinities were conducted in caverns, which became fetish-places. To the native Mexican the earth was the common father of all, and to this day when he would take a solemn oath, he stoops to the earth, touches it with his hand, and repeats the formula: "Does not our Great God see me?"⁶⁶ Mt. Rainier, called by the Indians Tacoma, was to them God.⁶⁷ Fire-clay is a fetish in British Guiana,⁶⁸ while some tribes in other parts of South America regard meteors as rapacious animals which hurl themselves upon their prey.⁶⁹ The connection between stone-fetishism and the dead is clear in the case of the Guiana tribes who regard certain blocks of granite as local warriors who, after death, have been changed into stone.⁷⁰

Stone-fetishism was widespread among the peoples of antiquity. The ordinary artificial mark of a Semitic sanctuary was the sacrificial pillar, cairn, or rude altar. Stones were used also in lots, being shaken in an urn until one "came out."⁷¹ Jahweh as the old nature-deity differed little from the gods found throughout western Asia; as master of storm and thunder he dwelt on the heights. The places of worship were high places, and in the time of Elijah, the seat of Jahweh was at "Horeb, the mount of God."⁷² Holy stones were revered by the Greeks, being regarded as symbols of divinity and anointed with oil. The fetishistic nature of such practice is not far removed from the reverence paid today to images in churches.⁷³ In the year 205 B.C., the decemvirs at Rome, consulting the Sibylline Books on account of the frequent showers of stones that year, came upon a *carmen* which said that whenever an enemy

from an alien land should wage war on Italy he could be expelled thence and conquered if the Idæan Mother should be brought to Rome from Pessinus. She was associated with a sacred stone called by the natives of that place the "Mother of the Gods."⁷⁴ But the most famous fetish-stone of antiquity was the black stone at Mecca. Before the time of Mohammed, Mecca was sacred territory and the black stone an object of veneration. As no one knew what it was, it long enjoyed immense reverence. It was housed in a building called Kaaba, which was the chief sanctuary and destination of pilgrimage for the Mohammedan world.⁷⁵

During the modern period in Europe there have persisted many superstitions about stone celts, said to be useful in medicine,⁷⁶ while there is much evidence of the worship of stones through a long period of time in France. Sometimes the people, of their own volition, transformed the effigies from the graves of the nobility and gentry into statues of saints. That of a chevalier which was in the church of Vigeau received the name of St. Eutrope; the relatives of a sick person would scrape with a knife that part of the figure which corresponded to the seat of pain and give the scrapings to the sufferer in an infusion, while in the case of children the dust was put into their stockings or shoes. In order to christianize the practice to some extent, it appears that certain stones from which individuals came to demand cures were removed into churches. Marvellous impressions in stones were also objects of worship; Gregory of Tours cites several that were signalized by public veneration, among them one in the Basilica of Tours on which a saint had sat. New-born children who have a certain blue vein visible under the eyebrows, which they call "mal de St. Divy," are taken to Dirinon to the stone where Ste. Nonne, mother of St. Divy, left the impression of her knees, in order that the saint may preserve them from the premature death which the sign portends. "Every year on August 6th, from time immemorial the lame, the paralytic, the sick of every kind, come to the chapel consecrated to St. Estapin on the top of a mountain at a short distance from Dourgues (Aude). They make the tour nine times and then go to the platform on which rocks full of holes slightly project from the earth. Then each one finds a remedy for his misery, for all that is necessary is for him to insert the afflicted part into the hole in the stone to which it corresponds. The holes are of different caliber, corresponding to the head, the thighs, or the arms. This ceremony once performed, all attending are cured." The efficacy of visits to impressions depended also on the time of the day or night when they were made—an indication of the antiquity of the practice. Further, water remaining in basins or depressions was thought effective in case of illness; that in the depressions of the worn side of the "Pierre St. Benoit," or of the "Pierre qui Pleure," at St. James (Manche), always returns again into the cavities, no matter what is done to keep it out! People afflicted with skin-diseases came to bathe in a cradle-shaped rock in the neighborhood of St. Arnoux. The water in the grooves of the "Pierre qui Pleure" cures fevers, several sicknesses of infancy, and trouble with the eyes; that of a basin hollowed in a block of granite near the village of Termes also cures sore eyes, as did that which oozes into a little natural cup in the gorge

of Tarn, near the hermitage of St. Hilaire. After washing, the visitors generally threw into it a pin stuck into a piece of the clothes of the sick person.⁷⁷

The practice of throwing stones upon a heap by the wayside is a custom found in many places and appears, in some cases at least, to have a religious significance. The natives of the Banks' and Solomon Islands throw stones, sticks, or leaves upon a heap at a place of steep descent, or where a difficult path begins, believing that they thereby "throw away their fatigue."⁷⁸ Stone-heaps are commonly met with in Africa, especially among the Bantu tribes who, however, have no explanation to offer for the practice.⁷⁹ Heaps of stones are to be seen on the summit of every pass in Tibet and frequently at the mouths of the valleys leading up to them; no traveller fails to throw a stone on the heap as an offering to the gods, at the same time uttering a short prayer which ends with: "Gods, give me a hundred years."⁸⁰ Sacrificial piles, consisting for the most part of rude heaps of sticks, antlers, and bones, are common in Siberia, especially among the Samoyeds and Yakuts; "although these piles are often surrounded by driftwood, no Samoyad will venture to take a single piece, however much he may need firewood."⁸¹ Stones or sticks adorned with little rags are found among the Soyots, near the source of the Yenesei, on the banks of rivers or at the top of a difficult pass. These are "god-sticks" and are an offering to the demon of the place to avert the dangers of crossing. Whenever a Soyot acted as mountain guide or forded a river he expressed his gratitude for safety by adding a quota to the "god-stick" or at least by adding to the cairn one stone for each of the party saved.⁸² Stone-heaps similar in shape and built for purposes similar to the above are found in the Navaho and Moki countries in Arizona. Speaking of the Moki, Fewkes⁸³ says: "Ma-sau-wuh shrines are simply heaps of sticks or piles of stones, and it is customary for an Indian toiling up the trail with a heavy bundle of wood on the back to throw a small fragment from the load upon these shrines or to cast a stone upon them as he goes to his farm. These are offerings to Ma-sau-wuh, the fire god, or deity of the surface of the earth." Explorers frequently find in the Americas piles of stone, which probably served as burial-places for the early Americans, formed in a manner similar to the Indian cairns of the present time. In this way the Ozark hills of Arkansas and Missouri have been covered with piles of stones.⁸⁴ Mention is made of an agreement between Indians and white settlers in New Hampshire which was sworn to at two heaps of stone called "Two Brothers."⁸⁵ In New Mexico there is a stone of large size which it is the duty of every visitor to the locality to push forward a space; what necessitates this performance is not known.⁸⁶ The custom of making offerings on mountain-tops is common in South America, and stone-heaps are especially frequent in the Andes; the ancient Peruvians and others cast stones as an offering for a safe passage.⁸⁷

A peculiar use of stone-heaps among historic peoples is the practice known

as "scopelism." It is a sort of reflection of the herder-tiller incompatibility,⁸⁸ and consists in setting stones in a heap as a threat to one who should till a field which is still wild, or in scattering stones on tillable ground to spoil it, or more commonly as a threat of harm of some agrarian kind to terrorize a population. The most definite purpose seems to be to forbid the conversion of pastoral into arable land, under penalty of death, the threat being signified by the ominous pile of stones which gives rise to the name. This practice was once common in Arabia, being classified as a crime, for the stones were placed as a warning that if any one should cultivate that field he would die a violent death by the arts of those who placed the stones, "which thing produced so much fear that no one dared to go to that field, fearing the cruelty of those who had made the scopelism. The authorities are accustomed to follow this matter up severely, even to inflicting the penalty of death, for the thing itself implies a threat of murder." A somewhat analogous offense existed in Germany under the name of *Landzwang*, which, in the penal code of Charles the Fifth, is defined as a threat on the part of dangerous outlaws to commit a crime, that crime having relation to agriculture and the rights of owners.⁸⁹

The Extraordinary in Animate Nature. Animate objects often fall under the classification of the extraordinary and become fetishes. Such, for example, are the sacred trees. In San Cristoval the story runs that when the ghost-shark was killed by the people the sacred tree broke in two of its own accord.⁹⁰ No ordinary tree, evidently. The Buryats and Mongols worship trees, feeling special reverence for those which are crooked, with the tops curved over toward the ground. The Ostyaks regard with reverence the cedar standing alone in a pine wood, and attribute a sacred significance to places where seven larches grow in a row. The Samoyeds revere stones and trees; the Cheremis give sacrifices to the largest tree in the wood; the Votyaks think that very old trees have souls, to which they pay reverence. When a Votyak founds a household, he chooses as his protector a birch tree; tufts of its twigs are hung up in the house and renewed every year.⁹¹ The original sacred tree in Tibet is thought to have sprung from the hair of Tsong K'aba, the restorer and purifier of the Buddhist religion; on its leaves a true believer can distinctly trace the figure of Sakya Muni or his name in Tibetan characters.⁹² It is part of Hindu beliefs that to plant a pipal tree is a virtue, because on its every branch or leaf a god is supposed constantly to dwell. To cut it down or uproot it is a sin not easily forgotten by the gods; the man who trespasses against the pipal dies without male issue and thus without the hope of getting water in the next world. A man without issue worships the pipal tree daily with water in the hope of getting a son.⁹³ A Bengal folk-tale tells of a certain banyan tree haunted by spirits who had a habit of wringing the necks of all who ventured to approach at night. Another extraordinary tree is that which grew beside a Brahman's house and was inhabited by a female spirit of white complexion who one day seized the Brahman's wife and thrust her into a hole in the tree.⁹⁴ Furness⁹⁵ cites many examples of sacred trees among the Nagas and states that sacred rubber trees grow near the "morongs" (club-houses).

Before cutting down a large tree, Palaungs offer a prayer to propitiate the spirit that may have made its home in it; "this is only done if the tree is really large. Spirits that are strong take possession of the large trees, evicting any little spirits that may have made their homes there; these have to take up their abode in the smaller trees and bushes. The weaker spirits appear to be harmless and no one apologizes to them when their homes are cut down."⁹⁶ In Maori folk-lore occur a number of examples of goblin-trees: should a traveller when passing one such tree ask, "What place is this?" rain would set in. "So it behooves one to be careful when traveling in this region." Another goblin is a log which has the habit of chanting weird songs as it drifts along. A famous fetish-tree has the power of rendering barren women fruitful. "When a woman proves to be barren she proceeds to that tree, and by embracing it she may become fruitful. She is accompanied by a priest, who, during the performance, repeats the necessary invocations. One side of the tree, that towards the rising sun, is known as the male side, and that facing the setting sun is the female side. The sex of the child is determined by the side embraced by the would-be mother."⁹⁷

Holy trees were common in Greece; travellers were accustomed to pray to them and to adorn them with ribbons and other sacrificial gifts. Each god had his sacred plant or tree, Zeus the oak, Apollo the laurel, Athena the olive, and Aphrodite the myrtle. Among the Semites, frankincense was the gum of a very holy species of tree, collected with religious precautions.⁹⁸ Pliny⁹⁹ states that the right even to see the trees was reserved to certain holy families, who, when engaged in harvesting the gum, had to abstain from all contact with women and from participation in funerals.

"Do you suppose," asked Cicero,¹⁰⁰ "that there is anyone so senseless as to worship as a god something which he eats?" Yet it is not at all uncommon in ethnography to encounter cases where plants and intoxicating drinks made from them are thought to be possessed of a spirit. The use of kava in Melanesia is associated with all the important events of a man's life: at the time of childbirth the husband will drink kava while he prays to some departed ancestor to aid his wife, and in throwing away the dregs the cry of "Tut" will indicate an appeal that harm may be averted from her; at a funeral and also at the feast of the dead the men who are present drink kava, which is supposed to have spiritualistic influence.¹⁰¹ In East Africa, herbs which are thought to effect miraculous cures and many native poisons are fetishes, while in the west a new cult has grown up around a fetishistic drink which is supposed to protect against evil influences, to bring good health and prosperity, and to kill witches and those who deal in black magic.¹⁰²

Besides being used as food, maize was employed by Indian priests and conjurers in their mystical ceremonies.¹⁰³ When an Indian takes up a ginseng plant he first asks its permission to take a little of its flesh, then "he drops into the hole a head and covers it over, leaving it there by way of payment to the plant spirit."¹⁰⁴ Among the Seri, doubly consumed food is credited with intensified powers and virtues, and held to be especially potent in the relief

of hunger and in giving endurance for the hard warpath or prolonged chase.¹⁰⁵ Far-reaching examples of plant-fetishism are found among the Zuñi, who regard plants as sentient beings; the initiated can talk to them and the plants can talk back. "Plants also are sacred, for some of them were dropped to earth by the Star People; some originally were human beings, others are the property of the gods, and all are the offspring of the Earth Mother."¹⁰⁶ Among the many instances of the ceremonial use of plants among the Zuñi are the following: the blossoms of a certain plant ground to a fine meal and sprinkled into a bowl of suds used for bathing a new-born infant are said to make the hair grow on the head and to give strength to the body; another plant is made into a tea which is drunk by women desiring children; a very strong tea made of the root of a certain plant will cause a woman to become pregnant—"if the medicine fails it is because the wife's heart is not good"; if warriors chew the blossoms of another plant this will prevent the enemy from seeing how to aim their arrows truly; prayer-plumes attached to twigs of a certain plant will make rabbits appear in large numbers when sought by the hunter. Other uses of special plants are to cure timidity and to detect thieves.¹⁰⁷ The Indian of Mexico is inordinately fond of a kind of beer made from maize which he needs also for his ceremonies. It is given as medicine to the nursing infant; is set apart for the dead, as they cannot get rest without it; and is the great remedy in the medicine-man's hands. They never think of using it without first sacrificing a part of it to their god.¹⁰⁸

Plants and intoxicants were fetishes to the ancients. An excellent example is *soma*, a kind of creeper with a succulent leafless stem, which, indigenous in the ancient home of the Aryans as well as in the soil of India and Persia, supplied an invigorating beverage supposed to confer health and immortality and regarded as the vital sap which vivified the world. Eventually the great esteem in which the *soma* plant was held led to its being itself personified and deified. The god Soma was once the Bacchus of India; the whole ninth Book of the Rig-Veda is devoted to his praise.¹⁰⁹ The inspiring effect of intoxication seemed to be due to the inherent divinity of the plant that produced it; and the preparation of the draught was looked upon as a sacred ceremony. "Indra, intoxicated by *soma*, does his great deeds, and indeed all the gods depend on *soma* for immortality."¹¹⁰ Among the Persians and all Arabian peoples, a similar drink is regarded as the symbol of life and is made and drunk with religious ceremonies. The word *homa*, which is identical with the Vedic word *soma*, was used in two senses in the Zend-Avesta: first, it meant the twigs of a particular tree, the juice of which was extracted and drunk before the fire; second, they understood by it a spirit who had poured his life and vigor into that particular plant. There were many stories current in ancient times about the miraculous effects of the drinking of the *homa* juice—a panacea for all diseases—which led to the belief that the performance of this ceremony must prove highly beneficial to body and soul.¹¹¹ When Christianity was adopted by certain pagan peoples, the rite of communion was interpreted

according to ancient views: "The draught from the mystic cup, originally the juice of Homa, was supposed to have supernatural effects. It imparted not only health and prosperity and wisdom, but also the power to conquer the spirits of evil and darkness, and a secret virtue which might elude the grasp of death."¹¹² The religious significance of intoxicants is seen perhaps in its most developed form among the Greeks, among whom the main distinguishing factor of the religion of Dionysus was the cult of an intoxicant.¹¹³ In Rome the flower of the burning laurel furnished means for divination.¹¹⁴

§255. The Lucky and Unlucky.

IN the East African Protectorate it is held to be unlucky to count cattle or any other living creatures, while it is particularly unlucky to count girls. "All odd numbers are unlucky, but more than any seven is a bad number. A man will never herd cattle six days and rest the seventh; he must go on to the eighth day. This is called 'Ndethia,' and were a man to cease herding on the seventh day all the cattle would die."¹ In Uganda nine is the sacred number.² In the dairy ceremonial of the Todas certain numbers recur with great frequency and may be regarded as having a special sanctity on this account. Such numbers are chiefly three, seven, and nine.³ Among the Dyaks, even numbers are always an evil omen.⁴ Chinese philosophy identifies even numbers with the Yin (female) part of nature, that is, with cold, darkness, and evil, while odd numbers represent the opposite male element (Yang).⁵ Among the Chinese, as among the Hindus, sacred symbols are of great importance.⁶ In Cambodia, years of even numbers are unlucky, so the tuft of hair on the head of children is cut off at eleven for girls and thirteen for boys, or at thirteen and fifteen.⁷ Among the Indians of British Columbia to sneeze three times is lucky; it is also a good sign to sneeze through the right nostril.⁸ With the Diegueno Indians the ceremonial number is three or four.⁹ The modern notion that thirteen is unlucky is seen, among other exhibitions, in the desire of automobilists to avoid having it on their number-plates; some, indeed, go so far as to balk at any combination that includes the figure 13; a few even add up the numerals on the plate and if the total is thirteen insist on some other registration-number.¹⁰

McGee¹¹ mentions many survivals of the notion of mystical numbers. The vestigial uses of the binary-ternary system are innumerable. "Two persists as the basis of the semi-mystical Aristotelian classification, which still exerts strong influence on Aryan thought; two is the basis, also, of the largely mystical Chinese philosophy in which the complementary cosmologic elements, Yang and Yin, are developed into the Book of Changes; and it finds expression, either alone or in its normal union, in most Aryan cults. The mystical three pervades nine-tenths of modern literature and all modern folklore; it finds classic expression in the Graces and the Fates; it is particularly strong in Germanic and Celtic literature, cropping out in the conventional Three Wishes

¹¹ "Primitive Numbers," in BAE, XIX, 847-848, 849.

and Three Tests (a survival of the ordeal), and also as a customary charm-number; and in these or related ways it persists in half the families and most of the child-groups even of this country and of today. The concept survives, also, in all manner of trigrams—triangles, triskelions, hearts, etc.—of mystic or symbolic character.

"The quaternary-quinary system survives conspicuously in the form of graphic devices, especially the world-wide cruciform symbol, which has taken on meanings of constantly increasing nobility and refinement with the growth of intelligence. Hardly less conspicuous are the classic and later literary survivals in the Four Elements—air, earth, fire, water—of alchemistic philosophy, the Four Winds of astrology and medieval cartography, the Four Iddhis of Buddha, and the Four Beasts of Revelation, with their reflections in the ecclesiastic writing of two milleniums; while the survivals in lighter lore are innumerable. The system persists significantly also in its augmentals, especially 9, 18, 25, 49 and 61. The numerical vestiges are naturally for the most part quaternary, since the quinary aspect is merged and largely lost in algorithm.

"The senary-septenary system survives as the bridge connecting almacabala and mathematics. In the graphic form it became Pythagoras's hexagram of two superposed triangles, the equally mystical hexagram of Brianchon, with which Paracelsus wrought his marvels, and the subrational hexagram of Pascal, while the current hexagram of the Chinese is apparently a composite of this and the binary as well as algorithmic systems. In the numerical form, 6 and more especially 7 play large rôles in lore and in the classic and sacred literature revived during the Elizabethan period; even so recently as the middle of the century the hold of the astrologic 7 was so strong as to retard general acceptance of the double discovery of the eighth planet, Neptune; and equally strong is the hold on the average mind of certain senary-septenary augmentals, particularly those coinciding with the augmentals of the lower system. In idealized form, the number 7 has exerted marvellous influence on thought and conduct, especially in the medial stages of human development; according to Addis, 'The common Hebrew word for 'swear' meant originally 'to come under the influence of the number 7'; and this is but a typical example of reverence for the magical number among various peoples.

"The almacabalic double of 13 (which is at the same time an augmental of 5) has largely lost its mystical meaning in Europe and America, apparently through friction with practical arithmetic; but it retains no little hold on the oriental mind, and finds expression in twenty-five-fold collectives in India and China, and in a rather frequent organization of Tibetan tribes into 25 septs or formal social units."

Fetish-directions are rather common among primitive peoples; the author¹² from whom we are quoting refers them to life-experiences. In the conduct of both men and animals there is displayed a vague yet persistent placement of the two ever-present sides with respect to Self, a realization of a two-side universe—the danger-side in van, the safety-side in rear, with self the all-important center. "The evil side is outward, the good side at the place or domicile of the individual and especially of the group, as is shown by the homing instinct of the wounded carnivore, by the haste of the fire-crazed horse to meet the flames

12 In AA, I, 665-666, 667-668; in BAE, XIX, 844 (quoted), 846 (quoted).

in his familiar stall, by human and equine nostalgia, and by the barbarian longing for burial in native soil. Moreover, both animals and men reveal indications of instinctive placement of the sides in the individual organism; and the indications consistently point to persistent intuition of face and back as the essential factors of self. Yet there is a significant diversity in the assignment of the sides of the organism to the sides of the good-bad cosmos; in general it appears that among the lower and the more timid the back stands for or toward the evil, the face toward the good, and that among the higher and more aggressive the face is set toward the danger." It is stated also that right-handedness, apparently initiated by slight physiologic difference and unquestionably intensified by demotic selection, became even more predominant among primitive men than among their less superstitious descendants: "the dexter and dextrous hand came to be exalted in scores of languages as 'The One That Knows How' or 'The Wise One,' while the sinister hand was degraded by linguistic opprobrium into a symbol of evil and outer darkness. Naturally and necessarily the bilaterally symmetric division of the Ego into Right and Left fell into superposition with the antecedent Face-Back concept, and produced a quatern notion such as that expressed in the Cult of the Quarters. Happily this transition is crystallized in the language of the Pitta-Pitta of Queensland, which possesses directional inflections indicating Front and Back reckoned from the Ego; and it is especially significant that the inflection for Front applies also to Side."

A Hindu mode of worship requires the right side to be kept toward the object.¹³ The left of the host is the place of honor in China, the right in Mongolia and Tibet.¹⁴ When a war-party including both of the great tribal divisions of the Osage was being organized, the people pulled down their wigwams and reset them in a ceremonial order, which was in two squares with a dividing avenue running east and west.¹⁵ In all the ceremonies of the Parsees the north side is generally avoided. The children in the initiation-ceremony, the marrying couple at the time of the marriage-blessing ceremony, and the priests in all their religious ceremonies never sit with their faces turned toward the north. The old Iranians had a natural hatred for the north side, from which proceeded all kinds of dangers and evils, whether climatic, physical, or mental. On the other hand, the south was considered auspicious. The winds from the south were healthy and invigorating; coming in from the southern seas, they brought rain and plenty.¹⁶

Lucky and unlucky days or other periods of time have always had their devotees. In northeast Africa no marriages take place during three of the months, for they are held to be unlucky.¹⁷ The influence of the aleatory element is even more striking in Madagascar; in one clan of the Sakalava all children born on Tuesday are put to death, while almost every family has a day similarly ill-omened to their newly-born offspring.¹⁸ Nearly every Toda ceremony has its appointed day or days, the choice of these often being dependent upon another local institution, the sacred day of the village or of the dairy. "Every clan has certain days of the week on which people are restricted from following many of their ordinary occupations, although they are not the occasions of any special ceremonies." In addition to the village-day and the

dairy-day, another sacred day is that one in the week on which one's father died.¹⁹ Among the Javanese, Sunday, Monday, Thursday, and Friday are good days; they marry preferably on Monday or Friday evening.²⁰ Among the Palaungs "it is considered very lucky for the child if it is born at or near the time of full moon. To be born during an eclipse of either the sun or the moon, or during the time when the old moon has disappeared and the new moon has not yet been seen, is most unlucky. If the first child of a family is born on a Saturday, it is considered unlucky not only for the baby but for the father and mother as well. In such a case the parents may die early; they may quarrel and divorce each other; or they may become ill or very poor. In order to prevent such misfortunes, offerings should be made in the image-house. Sometimes the relatives steal an unlucky baby as soon as it is born, bringing it back to the mother on the following day, telling her and the father that it was certainly born on Sunday."²¹ In the Aztec year of eighteen months of twenty days each plus five supplementary days, the latter were unlucky; on them nothing was done.²²

Although, with one exception, Homer has nothing to say of holy days,²³ they were common among other peoples of antiquity. In Babylon each day was consecrated to one or another god,²⁴ while Friday is still considered by the Persians to be an especially lucky day.²⁵ During the Middle Ages the aleatory element was prominent in folk-beliefs.²⁶ Among the South Slavs, days are fetishistic, some being lucky, others unfortunate.²⁷ In one of the Mediterranean islands, Tuesday is regarded as unlucky, and no work is ever begun on that day.²⁸ In East Prussia many days in the year are held to be unlucky: a child born on any one of these days, if it lives, will be sickly and will lead a precarious existence; no marriage concluded on one of these days will be successful, but will be marked by strife and poverty; purchase and sale will bring misfortune and misery; in short, no undertaking on such days will succeed. Five of them are especially unlucky and it is strongly advised not to do anything on those days. Especially unlucky days are April 1, when Judas was born, August 1, when the devil was thrown out of heaven, December 1, when Sodom and Gomorrah were submerged; persons born on these days are always unlucky. In Vienna the photographic studios have involuntary holidays on Wednesdays and Fridays, for people even of the more intelligent classes avoid being photographed then because it brings no luck.²⁹ Friday is widely regarded as an unlucky day, especially Friday the thirteenth. A newspaper has listed a number of famous happenings on Friday: the marriage of Washington and of Queen Victoria, the birth of Napoleon Bonaparte and of Shakespeare, the battles of Bunker Hill, Waterloo, and New Orleans; also the burning of Moscow, the discovery of America, the landing of the Mayflower's passengers, the execution of Joan of Arc, the destruction of the Bastille, the signing of the Declaration of Independence, the assassination of Julius Cæsar and of Lincoln. Such catalogues are significant of popular interest in the fetish-day.

§256. The Animal-Fetish.

BEFORE citing cases of animal-fetishism, we list examples of the attitude taken by primitive peoples toward animals. That they do not hesitate to trace descent from beasts is a fact already familiar.¹

The word for ancestors, among the natives of the Papuan Gulf, is practically the term by which all objects are designated that are held sacred. "A certain animal was regarded as sacred by the original ancestor; he never injured or killed it, never ate it as food when killed by anyone else, and because it was held sacred by him, his posterity for all time must also regard it as sacred. If a man accidentally kills a member of the family of his *ualare*, he sets aside a period for mourning, during which period he fasts from the principal kind of food, eating only enough to keep himself from absolute starvation; he also observes many of the customs of mourning as if he had lost a relative. If on the other hand he kills a member of his *ualare* family in a fit of anger or for any other reason that is not justifiable, as soon as he recognizes what he has done he gives himself over to violent grief, abstains from all kinds of food, isolates himself from his relatives, and ultimately dies of starvation."²

In the mythology of the Koryak the intimate association of men and animals is strikingly portrayed. At the time of Big-Raven, that is, during the mythological age, all objects on earth could turn into men, and *vice versa*. There were no real men then; Big-Raven lived with animals, and apparently with inanimate objects and phenomena of nature, as though they were men. "He was able to transform himself into a raven by putting on a raven coat, and to resume the shape of man at will. His children married or were given in marriage to animals, such as seals, dogs, wolves, mice; or phenomena of nature, as the wind, a cloud (or Wind-man, Cloud-man); or luminaries, like the Moon-man, Star-man;" or even to such lowly mates as special stones, trees, sticks, or plants. "Men were born from these unions. When Big-Raven was no more, the transformation of objects from one form to another ceased to take place, and a clear line . . . distinguishing men from other beings was established."³ India teems with animal-life, and beasts of every description appear to live on terms of the greatest confidence with human beings. Everywhere they dispute possession of the earth with man. Metempsychosis leads the Hindus to think that a beast may at any moment develop human faculties; a noxious insect may contain a sage's soul; to them, stories of talking animals are not fables but incidents which contain no absurdity. The characteristics of animals and their relation to men also lead the natives to reverence them. "A Hindu," comments Monier-Williams,⁴ "worships a cow because he is profoundly sensible of the services it renders him; he worships a serpent because he dreads its power of destroying him by the slightest puncture; and he worships a monkey because he stands in awe of the marvellous instinct it displays." Among the Nagas, men and tigers are still regarded as brothers; if an Angami kills a tiger, he says, "The gods have killed a tiger in the jungle" and never, "I have killed a tiger," while the priest of the village proclaims a day of abstinence

from work "on account of the death of an elder brother."⁵ Wilken⁶ cites many fables, chiefly from the East Indies, of magicians whose lives were dependent on the lives of animals so that they could be killed by killing the latter; also of female jealousy exerted by getting control of a fish on whose life that of a rival female depended; and he goes on to mention cases of a familiar beast or bird with which one's welfare is thought to be connected. No one in Borneo will intentionally kill a cobra, nor one particular species of the lizard, nor owls, nor any of the birds of omen. There are certain animals and birds which many families abstain from injuring, sometimes because of a dream, again by reason of a tradition. Among some tribes a civet may not be killed, nor an orang, nor a crocodile. It is believed by one tribe that an orang once helped it on a critical occasion.⁷ It may be recalled that the gibbon was similarly an ally of the Bornean.⁸

Since the Samoan gods were supposed to have some visible incarnation, the particular thing in which his god was in the habit of appearing was to the Samoan an object of veneration. One, for instance, saw his god in the eel, others in the shark, the turtle, the dog, or the owl. "A man would eat freely of what was regarded as the incarnation of the god of another man, but the incarnation of his own particular god he would consider it death to injure or to eat. The god was supposed to avenge the insult by taking up his abode in that person's body, and causing to generate there the very thing which he had eaten, until it produced death." These cases approach totemism.⁹

There is some evidence among the Eskimo of a belief that bears, foxes, and other animals had been at one time human beings.¹⁰ The natives say that the bear "talks sealish" to fascinate seals.¹¹ Nansen¹² reports a case where, a bear having come near the house, the women untied their topknots that he might think they were men and keep away—in the belief that bears had human understanding. The mother of the boy who had first seen the bear slipped her trousers down to her knees and shuffled about the room plaiting some straws, which they said was to weaken the bear so as to make it easier to get the better of him. There is evidence of a belief in imitative magic, for they all drank of bear's blood in order to prove to the whole race of bears how they thirsted after them. If they saw the track of a bear in the snow, they ate a little of it in order to assure themselves of killing the bear if it should happen to come back the same way. Little boys were given the kidneys of bears to eat in order that they might be strong and courageous in bear-hunting.

"Among the Salish tribes it is uniformly believed that in the early days, before the time of the tribal heroes or great transformers, the beings who then inhabited the world partook of the character of both men and animals, assuming the form of either at will."¹³ The Indians of the Northwest Coast ascribe to animals intelligence and the ability to understand human speech. They believe that they themselves come from animals and so use animal-masks.¹⁴ A number of tribal names mean "those who became human beings by the aid of the buffalo," or crane, or other animal, while the eagle, coyote, and

beaver are regarded as the original inhabitants of the world.¹⁵ The Kootenay hold that there are spirits in all things, inanimate and animate; at death the human spirit enters into such things.¹⁶ The Sioux, when they surrounded a herd of buffalo, demanded through their public criers that the souls of these animals should depart.¹⁷ The turtle might be one's uncle, the mink an adopted son, the woodchuck a grandmother.

All in the olden time,
Or in the first of all,
Of all things here on earth,
Men were as animals
And animals as men.
But how this mystery was,
No one can understand,
Though some explain it thus:
As Man was made the first,
All creatures first were men,
But as they gave themselves
To this or that desire
Like that of animals,
And all their souls to it,
So were they changed to brutes.¹⁸

"Although the belief in the powers of inanimate objects is common," comments Boas,¹⁹ "we find in America that, on the whole, animals, particularly the larger ones, are most frequently considered as possessed of such magic power." In the folk-tales collected by Grinnell²⁰ there are many instances of animals helping men, even restoring the dead to life. In these stories animals talk: "Sometimes the buffalo-bulls talked to them, and sometimes the elk and the bear. It was always a male that talked. Not everyone could understand their language. Only now and then a person understood. . . . On the other hand, if favorably inclined, the mule-deer may help a person in many ways. As elsewhere pointed out, the white-tail deer is a powerful helper in love affairs. . . . It is said that in very old times beavers were not often killed, and that no Cheyenne woman would dress or even handle a beaver-skin. . . . The skunk possesses power. Doctors used its hide to hold their medicine. Men tied its tail to their horses' tails in war. It is engraved in ornament on the seeds employed by women in gambling, and is painted on robes and lodges. . . . In ancient times no one killed wolves or coyotes, and women would not handle their skins. . . . A man who could understand the speech of the wolves would turn back if a wolf or a coyote were killed by any member of a war-party with which he was journeying. These animals were seldom killed by the Cheyennes in old times, possibly because the medicine arrows were always wrapped up in the skin of a coyote."²¹ Considering how important to self-maintenance were the various animals, notably the buffalo, it is not surprising that supernatural powers were attributed to them. From the buffalo the Indians had food, fuel, dress, shelter, and domestic furniture, shields for defense, points for arrows, and

strings for bows. According to the old Spanish chronicles of Coronado: "They make so many things of them as they have need of, or as many as suffice them in the use of this life." "The buffalo was the sign of the Creator on earth as the sun was his glorious manifestations in the heavens."²²

"For the Indians nothing is dead, all things are alive, they are either gods or Indians. Animals, for instance, are not animals; they only look that way; but they are Indians just like the rest."²³ To understand the way of thinking of the Indians, comments Von den Steinen,²⁴ we must throw aside entirely our notions of the division between man and other animals. A medicine-man understands all the languages of beasts, birds, and fishes. The Indian does not say, "I am a man, and I think of the animals as acting like men." On the contrary, men are thought of as animals, both in the good and bad sense. The tribes identify themselves and each other with animals. Some animals are also thought of as being the lords of particular plants, such as tobacco, cotton, mandioca; others as lords of sleep, or of the hammock, or of the jars filled with water. The Indian is indebted to the animals for what he can do; they form the basis of his living. Why should he not attribute to them the other things whose origin he does not know?

In Costa Rica the deer is tabooed because the souls of the deceased, when they are not roaming alone in the darkness of the forest, seek out the body of the deer as an abiding-place.²⁵ Evil-workers among the Araucanians are thought to be malignant spirits who have taken the form of a beast, bird, reptile, or insect, and whose identity is revealed to the medicine-man in a trance. Frequently these agents are distinguished by some peculiarity or unusual color.²⁶ "Whereas the medicine-man among the Bakairi only temporarily, during narcosis, is transformed into beasts, and goes to heaven after death in human form, death among the Bororo is nothing else than a transformation into beasts, a dream the reality of which has become evident to everybody." The red parrots are Bororo, and the Bororo call themselves parrots; they never eat these birds and never kill tame ones, but lament when one of them dies. The dead of other tribes become other birds. The soul is thought of as a bird, on account of its flights in sleep.²⁷

Animal forms in which the gods of the ancients were clothed have not an allegorical character; they indicate an animal-worship which reappears in more than one ancient and modern religion. "The ambiguous forms themselves, half-man, half-beast, simply prove the ignorance and credulity of the ancients in the matter of natural history."²⁸ The chief symbol of their gods might be a hewn image—Jahweh was often revered in the form of a steer—but was preferably a living animal, distinguished from all others by special marks, as a pledge of the nearness and eternity of God.²⁹ We also find the titles of Bear, Ox, Colt, and other similar names borne by the initiates of the different mysteries in Greece and Asia Minor; they go back to that period where the divinities themselves were represented under the forms of animals, and when the worshipper, in taking the name and semblance of his gods, believed that he identified himself with them.³⁰ When worshippers ate such animals, they

thought they were eating the body of the god. "On the analogy of these instances we might conjecture that wherever a god is described as the eater of a particular animal, the animal in question was originally nothing but the god himself."³¹ Owing to the capricious character of fetish-selection, one finds direct contradictions and usages exactly reversed. In Egypt, for instance, they worshipped their goats and ate their sheep; in one place the crocodile is venerated, while not far off it is exterminated.³² The power of belief is seen in the statement by Diodorus³³ that in the time of famine the Egyptians ate each other rather than any animal which they considered sacred and that on one occasion a mob tore in pieces a Roman soldier who had killed a cat.

Islam admits to Paradise, and to a life hereafter, a long list of animals, beginning with the ass of the Prophet Mohammed, the camel of the Prophet Saleh, the calf of Abraham, the ram of Ishmael, the ox of Moses, the ant of King Solomon, the mule of the Queen of Sheba, the whale of Jonah, the dog of the Seven Sleepers, and last, but not least, the spider which spun its web across the entrance of the cavern in which Mohammed had sought refuge in his flight from Mecca; thus were his pursuers convinced that their human quarry could not be within.³⁴

Fetish-Animals (wild). Turning now to specific fetish-animals, we find the serpent to be quite commonly in evidence and in some places to be the object of a cult. There are many instances in the Solomon Islands of the snake-fetish or snake-spirit.³⁵ One tribe in East Africa believes it is descended from the python; "these reptiles are looked upon as sacred and annual sacrifices are made upon a hill in Kadimu to the common ancestor. . . . Certain snakes, however, are looked upon as sacred animals among some of the Unyamwezi clans and it is highly probable that, as among the Kadimu, this is due to the belief that the snake was their common ancestor. Many Wanyamwezi consider it a deadly sin to kill a snake, and one occasionally meets an individual belonging to one of these clans who is said to be immune from the effects of snake poison."³⁶ There are also in Africa a number of cases of snake-cult and of belief in snake-incarnation.³⁷ In India the serpent is feared and revered, while it is thought that the name Nagar or serpent-men was given to a serpent-worshipping people by their neighbors. Every Nair family still holds the serpent sacred; it will not cut down a serpent-grove, as it is the place where the family serpents reside. A number of tribes have a serpent-totem: "the members will call themselves serpents, claim descent from a serpent, abstain from killing serpents." Not only do the Nairs still show traces of having done all this, but they continue to utter prayers and songs to the sacred serpents. "When anything goes wrong the astrologer generally finds something done to offend the sacred serpents."³⁸

Wilken,³⁹ writing mainly of conditions in the East Indies, states that the python and the cobra are the animals generally selected by the spirits for their habitation—"not all the members of either class, but only individuals which become known as spirit-possessed through dreams or inference from other signs. Should one of these reptiles be in the habit of frequenting the vicinity

of a village house, it is always regarded as the good genius of some one or other of the principal men in it." The snake must not be killed but handled with reverence. Among the many cases mentioned is one where a small cobra came under a house and crawled about, not heeding those who were watching its movements. "I found it was a constant visitor, and was said to be a 'spirit-helper' of a man of the place, who, no doubt, would have fined any one who dared to lay violent hands upon it. In another case, a large python went up into a house, and the inmates interpreted the visit as that of one of the beneficent powers." The great boa is the most formidable of all demons who people the spiritual world of the Jibaro Indians. "He is the original father of witchcraft; it is from his body that the sorcerers receive the poison with which their organism is impregnated and the invisible arrow, which they discharge against their victims. After death the souls of the medicine men are also believed to enter into the boa. The Jibaros, like all Indians, therefore particularly fear this monster, and when they kill a boa they think that they kill a powerful sorcerer."⁴⁰ The snake was revered by the ancients and sacred snakes were to be found in the temples.⁴¹

The turtle is regarded as a fetish in the Pacific Islands. "Turtle fishing is not gone in for much, as the natives are superstitious about the turtle, and civilisation has not yet been able to dispel their fears. One of the chief ones is that the eggs are sacred and may not be eaten. But one by one," comment Hardy and Elkington,⁴² "their superstitions are going, for they see how the white man prospers in spite of scorning all their sacred ideas, and that now and then makes them courageous enough to break through the barrier, and when once a superstition has been found untrue, they are not slow in testing another, if by challenging it they can see any gain for themselves." This element of rational selection in their mores, it should be noted, is restricted to the economic interests, a field in which it is possible to get tests and verification.⁴³ In South Africa "the crocodile is held in respect by every Becwana tribe, even by those who do not venerate it as a totem. It is commonly believed that if a man wounds a crocodile, the man will be ill as long as the crocodile is ill of its wound; and that if the crocodile dies, the man dies too."⁴⁴ In the Upper Congo region, the crocodile is associated with witchcraft: in cases of accidental death such as the swamping of a canoe in a storm or through over-loading, the natives say god or providence caused the accident; but other accidents in which they observe what they consider exceptional circumstances, as the upsetting of a canoe by a crocodile, they put to the account of witchcraft, as no crocodile would have done it unless it had been instructed to do so by a witch or unless the witch had gone into the animal and made it commit the outrage.⁴⁵ Wilken⁴⁶ treats of the lizard as a fetish and as a motif in ornament; he finds it revered not only in the East Indies but all over Polynesia as well, though not so widely honored as the crocodile. In the legends of some of the American Indians the turtle appears as a perfect Falstaff, a worthless old scamp who is nevertheless liked by everybody and greatly privileged.⁴⁷

Rapacious animals are often worshipped or revered, either being greatly

47 Leland and Prince, *Kulóskap*, 124.

feared or admired on account of their powers. The first seems to be the case among the West Africans,⁴⁸ while in the Papuan Gulf region "the wild boar's tusk, the acquisition of which is greatly desired as a mark of bravery, is not so much coveted as a personal adornment, as for the courage, ferocity, and daring which it is supposed to contain and to be capable of imparting to anyone who secures it."⁴⁹ The mammoth plays an important part in Chukchi beliefs; "if the tusks are seen above ground, this is a bad omen, and unless an incantation is uttered something untoward will happen." Because of various beliefs, the search for mammoth-ivory was tabooed in former times, and "even now, a man who finds a mammoth-tusk has to pay for it to the 'spirit' of the place by various sacrifices. The search for such tusks is considered a poor pursuit for a man, notwithstanding the high price which the ivory brings." Another reason for the reverence accorded animals of prey is the belief that they may harbor the spirit of a deceased man; this is clearly seen in the attitude of the Gilyak toward the bear. "It is the common duty of clansmen to feed the bear, and to take part in the bear-festival, when the bear, either tame or wild, is killed. This festival has both a religious and a social significance. In the former case, it is a religious duty to venerate the slain bear, for he may belong to the fraternity of the 'owners of the mountain,' or be the incarnation of some remote fellow clansman's spirit, which has been received into that fraternity. Again, the bear is regarded as the intermediary between mortals and the 'owner of the mountain.'" The bear-festival serves to protect the people from the wrath of the slain animal and its relatives.⁵⁰

Although the bear-festival is common to all the Palæo-Siberians and is celebrated also by some of the Neo-Siberians, it has reached its highest development among the Ainos, who honor the animal as a god. They have good reason to respect the bear: it is most valuable to them, affording them food and clothing and a medicine, the bear-gall, which is greatly prized. On the other hand, it can do them great injury, as when it enters their dwellings or kills their domestic animals. Therefore it seems natural that they should seek to propitiate the bear, to confer upon it a title of great honor, and that they should consider an atonement necessary for putting it to death. At the end of winter a young bear is caught, confined in a wooden cage, and fed by the wife of the captor. The bear-festival usually takes place in September or October, by which time the captive has grown so large and strong as to threaten to break the cage. It is then killed with great ceremony. The man who gives the feast assumes all expenses and invites his friends and relatives. Such a festival is very expensive, for enormous quantities of saké are consumed; hence it is considered a great honor to give a bear-feast, though at the present time such celebrations are becoming less and less frequent. After some ceremonies in the house, offerings are made before the bear-cage by the host and others. Some saké is given to the bear in a special cup. The woman who has reared it weeps to show her sorrow at its approaching fate. A rope is thrown around its neck and it is led out of the cage and taken to the sacred hedge where it is killed. After it is skinned and disemboweled, the legs and trunk are separated from the head, which remains in the skin. The blood is caught in cups and greedily drunk; the liver is cut in small pieces and eaten raw; and the flesh and entrails are preserved in the house, to be divided among the participants in the feast on the following day. The head is placed on the sacred

hedge, found on the east side of every house, where it is held sacred and honored as a representative of the gods.⁵¹

Foxes play a conspicuous part in the legendary lore of Japan as retainers of Inari San, the god of rice, and Kitsune-mochi or "fox-possession" is a common belief. "So important have these followers become, that they almost obscure their lord, and have usurped his worship and his temples. All over Japan one sees their images, of all sizes and ages, funny and grotesque, but often menacing. In the popular fancy the fox is endowed with great powers. He can be invisible at will, or can assume human form, though his imperfect speech will often betray him in spite of his disguise. He brings good fortune, but is so punctilious in his etiquette that he is easily offended—and then woe unto him who offends! He will suffer endless misery, for the fox never forgives. Moreover, the beasts are rapacious and need a deal of feeding; and as all fox families are seventy-five in number, it is nothing short of ruinous to have them attach themselves to a human household, which is their uncomfortable habit. Consequently, a man said to possess foxes is shunned. His friends hesitate to visit his house for fear of incurring the enmity of the invisible animals. Even the land loses its value and cannot be sold, however rich it may be, for where once the fox has been foxes will go; and whoever occupies the place must feed the hungry seventy-five. So deep-rooted is this belief that intermarriage among the possessed families is almost compulsory, for the unafflicted would think not once but many times before allying themselves to the mysterious Kitsune. Besides, he is mean enough to enter the form of his human benefactor, and cause him to yelp and bark, frothing at the mouth, and fill him with a most undesirable form of madness."⁵²

In India, as in other Asiatic countries, the elephant, on account of its nature as well as because of the Buddhist conceptions associated with it, supplies several sorts of amulet. Its ivory is considered to be protective against the effect of the jealous or envious eye, bad dreams, and the like, a virtue extended sometimes to bone which, possibly through ignorance, is taken as ivory.⁵³ Belief in transmigration accounts for some of the notions concerning leopard-men in the Naga hills. "Both the Angami and Sema agree in holding that there is no actual transformation of the body of the lycanthropist into a leopard. What he seems to do is to project his soul into a particular animal with which his human body also thus becomes very intimately associated." A leopard which is thus the recipient of a human soul may be recognized by having five claws on each foot, and is called by the Angami a term meaning "real man."⁵⁴ Tigers are honored in many places.⁵⁵ In Sumatra "they speak of the tigers with a degree of awe, and hesitate to call them by their common name, terming them respectfully *nenek* (ancestors), as really believing them such. No consideration will prevail on a countryman to catch or to wound one, but in self-defence, or immediately after the act of destroying a friend or relation. When an European procures traps to be set, by the means of persons less superstitious, the inhabitants of the neighbourhood have been known to go at night to the place, and practise some forms, in order to persuade the animal, when caught, or when he shall perceive the bait, that it was not laid by them, or with their consent."⁵⁶ The Jibaro Indians regard a jaguar which

attacks and kills people as the incarnation of the soul of an evil sorcerer which has entered that wild beast with a view to harming or killing his enemies. Some years ago an Indian woman was killed by a jaguar in the neighborhood of Rio Zamora; the natives consequently resolved to take revenge, arranged a hunting of the animal, and succeeded in killing it. They thereafter made a trophy of its head and a victory-feast was celebrated in the ordinary way.⁵⁷

Special qualities have given some wild animals a peculiar place in native beliefs. On account of its cunning, the jackal plays an important part in Hindu folk-tales, as the hare does in the folklore of the Bushmen of South Africa, the rabbit among the American negroes, Reynard the Fox in European folklore, and the badger in the folk-beliefs of the Japanese.⁵⁸ There are hundreds of tales in South Africa concerning the adventures of the hare, tales with which every Mocwana mother is familiar; and they all go to show that he is the "slimmest" [most rascally] of all the animals. Occasionally one sees a Mocwana wearing a hare's foot as a charm.⁵⁹ In northeast Africa the hare brings good or bad luck—good luck if he runs in the direction of the pedestrian, bad if in the opposite direction or if he crosses the path.⁶⁰ When the supply of hares becomes exhausted, as it frequently does, an Athapascan tribe believes that they have mounted to the sky by means of the trees and that they will return in the same way when they reappear.⁶¹

Fish, Birds, etc. The sea has furnished a number of fetishes. Fish, eels, and sharks are common fetishes in Melanesia.⁶² In the Solomons all sharks are not sacred, but a great many are thought to be possessed by ghosts. At Ulawa there were two familiar sharks who were widely known and respected; "these ghost sharks did not harm their worshippers, but were often sent by them to kill men at a distance." One such shark was given some of the earth on which the victim's spittle had fallen or some of the earth from his footprints in the sand, so as to be able to trace the victim.⁶³ Toads among the Zuni were regarded as sacred and were kept under pots in order to obtain rain and fine weather. "By some of the tribes frogs were regarded as the gods of the waters, and, like the toads, were beaten when rain did not fall."⁶⁴ Among the offerings which some South German women of today sacrifice at the time of childbirth or during women's diseases is the frog made of iron or wax or, less commonly, of silver.⁶⁵

"The fish, as the inhabitant of the mysterious, indestructible never-resting water, early impressed man deeply, and was considered by him as the genius and representative of the life-producing element. Traces of the veneration of the fish, sometimes revealed in taboos, are found everywhere in ancient times and still exist in various parts of the world." A center of ichthyolatry in antiquity was Syria, where a fish-goddess was worshipped as a phase of the great Semitic mother goddess Astarte, being regarded as a personification of the fructifying power of the water. Reminiscences of this cult still survive in the cherishing of sacred inviolate fishes in some places near mosques. Certain species of fish were sacred and forbidden food to all the Syrians, who believed that if they ate the sacred fish they would be visited by ulcers. Yet fish were daily cooked and presented on the table of the goddess, being afterwards consumed by

the priests; and Assyrian cylinders display the fish laid on the altar or presented before it, while, in one example, a figure which stands by in an attitude of adoration is clothed, or rather disguised, in a gigantic fish-skin. Such disguise implies that the worshipper presents himself as a fish, as a being kindred to his sacrifice and doubtless also to the deity to which it is consecrated. "Tales of the fish as a medium of transformation and incarnation of spirits and ghosts are met with among various nations, and in later times the fish seems to have been, next to the bird, a symbol of the departed human soul. The fish as carrier of man across the water was illustrated by the story of Arion and the dolphin as told by Herodotus, and by the Biblical narrative contained in the book of Jonah. Parallel narratives of a man being swallowed by a sea monster were quoted from Greek, Polynesian and Cherokee lore." The belief in the magical healing properties of the fish is also widespread. "The fish was generally considered as a being of good omen, benevolent and beneficent to man, and by reason of its own great fertility it was a symbol of increase and abundance. Various regions had their favorite species of fish which were endowed with supernatural qualities. Thus among the classical nations the dolphin was termed the 'saviour fish' (*piscis salvator*). In the Far East (China and Japan) the carp was the fish of good omen, while among the ancient Irish the salmon was the 'fish of wisdom,' the mere sight of which brought healing."⁶⁶

Among the ancients, flies, vermin, and mice were thought to possess supernatural and daimonic qualities.⁶⁷ Like the dog, the cock is a defender by night, and also like the dog is the protecting fetish of nomads. Lippert⁶⁸ believes that the cultus of the cock led to his domestication. The cock was sacred to Buddha, and in Tibet was kept on the roofs of monasteries, never being killed nor, in some places, ever eaten. Our practice of having the cock on weather-vanes (weather-cock) is a survival of the time when the bird was believed to keep watch against spirits; it figures in such a capacity in Teutonic mythology.⁶⁹ The Nagas use a red cock to get omens, while a white chicken is used in promoting harvests and good luck.⁷⁰ In the case of one Russian tribe a cock or hen is carried before the coffin and cast across the grave to some poor person, with a wish for an easy flight for the deceased to heaven.⁷¹ In the South Seas the frigate-bird, being more or less sacred, is not eaten and seldom harmed.⁷² In West Borneo the hawk is regarded as the first ancestor, which lived and had many offspring and then turned into a bird; it will come to aid one if he scatters rice.⁷³ In New Zealand two special varieties of owl are sure signs of a plentiful season.⁷⁴ In China, the bat is an emblem of happiness, from the similarity of the sound of its name and the word for felicity.⁷⁵ According to beliefs, here as in India, ghosts may appear in the form of birds of prey.⁷⁶ In 1921 a riot occurred in Bombay when two European boys killed some sacred pigeons in the streets of that city.⁷⁷

Birds were common fetishes in the New World. One member of the Tlinkit tribe has had a red-bird in his possession for a number of years; he attributes

every piece of good fortune to his possession of this bird.⁷⁸ The Kwakiutl prayed to the lark for avoidance of sickness and misfortune.⁷⁹ The eagle was the greatest fetish-bird of the Indians; among the Haida, passes made with eagle fans were thought to be effectual in conjuring, a belief which reappears in many tribes. The wing-bones were often employed as sucking-tubes with which medicine-men attempted to cure disease; they were also fashioned into whistles to be carried by warriors or used in ceremonies; and the talons formed powerful amulets, having secondary value as ornaments, while the feathers were of even greater importance. "The eaglets, when required for feathers, have their heads washed; they are killed by pressure on the thorax, and buried with appropriate rites in special cemeteries, in which offerings of small wooden images and bows and arrows are yearly deposited." Some tribes had property in eagles.⁸⁰ The Caddo in old times would never kill an eagle, unless for its feathers by a hunter regularly initiated and consecrated for that purpose.⁸¹ The Pimas have a legend of an eagle which would occasionally assume the shape of an old woman, visit the pueblos, and steal women and children, carrying them to his abode on an inaccessible cliff; on one occasion the eagle seized a girl with the intention of making her his wife.⁸² The Jibaros look upon a certain mysterious night-bird with superstitious dread, believing that the soul of the murdered enemy may take the shape of that bird to send them sickness and death.⁸³ The Guiana Indians regard some birds as spirits bent on inflicting punishment; these may be killed; on the other hand, there are certain birds—owls, goat-suckers, and others—which must not be killed under any circumstance whatever. Such birds do not wish to injure the Indians but to give them a warning or token. "They are receptacles for departed souls, who come back again to earth, unable to rest for crimes done in their days of nature; or they are expressly sent by Jumbo to haunt cruel and hard-hearted masters, and retaliate injuries received from them. . . . If it be heard close to the negro's or Indian's hut, from that night misfortune sits brooding over it; and they await the event in terrible suspense." The natives have the greatest superstition with regard to the goat-sucker and would not kill it at any price. "They say it keeps communication with the dead, and brings messages to their conjurers. Even the common people on the coast return in a great measure this superstition, and hold the bird in great awe. Its nocturnal habits, the swiftness and peculiarity of its flight, and its note, which breaks the silence of the night, have no doubt contributed to the fear which Indians and Creoles entertain for the Wacarai or Sumpy Bird."⁸⁴

Fetish-Animals (domesticated). Respect and reverence is paid to domestic animals among many pastoral peoples in various parts of the globe. They are regarded on the one hand as the friends and kinsmen of men, and on the other as sacred beings of a nature akin to the gods; their slaughter is permitted only under exceptional circumstances, and in such cases are never used to provide a private meal, but necessarily form the basis of a public feast if not of a public sacrifice. One of the clearest cases is that of a nomadic tribe in East Africa which "gave the name of parent to no human being but only to the ox and cow, the ram and ewe, from whom they had their nourishment."⁸⁵

Cow-fetishism is indicated by many customs and taboos: by national custom no Yoruba may milk a cow, and in consequence cows are always tended by foreign-born slaves⁸⁶—an exception to the prevailing custom of cattle-raisers.⁸⁷ Cases of Hindu reverence for the cow might cover much space: "the water it ejects ought to be preserved as the best of all holy waters—a sin-destroying liquid which sanctifies everything it touches, while nothing purifies like cow-dung."⁸⁸ In the Code of Manu⁸⁹ one of the blackest of crimes is to kill a cow. Among the Greeks of Homer's time there was evidently a taboo on the milk of cows, as on the flesh of fish;⁹⁰ and the late Professor Seymour once remarked, while commenting upon the non-use of cow's milk in Homer, that in Crete it is still believed that if a man milks a cow he will die before the year is out.⁹¹ As with certain negro populations in the valley of the Upper Nile, the Egyptians used only bulls for food; to kill a cow, or even eat her flesh, was more than a crime, it was anathematized as a sacrilege. "Neither will any man or woman amongst them kiss a [cow-eating] Greek upon the mouth, nor use a Greek knife for the spit or cooking-pot."⁹² The Apis at Memphis, a black animal with certain white markings, was regarded as a special incarnation of the highest deity; it was born in a miraculous way, was revered all over Egypt as a god, and after death was buried with the greatest ceremony.⁹³ The ass also figures in the cult of the ancients; so do goats and swine.⁹⁴ Male swine were the exclusive sacrificial animals of the Manchu and were fattened in the temple-court.⁹⁵ Cats also have a place in the cult, while many superstitions surround them today.⁹⁶ They enjoy special consideration in some European districts; whoever kills one is bound to die in the course of the year.⁹⁷ But more significant in primitive religion is the attitude toward the horse.

The horse has come in for much reverence and has been supposed to have special knowledge and powers indicating possession by a daimon. In Homer,⁹⁸ Hera inspires the horse of Achilles to prophesy. "Next to speed, the property of the horse most spoken of in the Avesta is that of sight. The horse was thought to possess the power to see on the darkest and most cloudy night a hair lying on the ground, and to distinguish whether it was a hair of the tail or mane of a horse." One horse saw, "from the distance of two forsangs, an ant on a black saddle cloth." The king's stable was deemed by more modern Persians one of the most sacred of sanctuaries; a noble who aspired to the throne took refuge there and remained unmolested till he was pardoned.⁹⁹ Oracles were taken by the ancient Germans and Slavs from the neighing or special movements of white horses.¹⁰⁰ Tacitus's¹⁰¹ account of the observation of the sacred horses states that the priest and king regarded themselves as the servants of the gods but the horses as their confidants. The Greek Pegasus and Centaur have appeared in literature for ages. "The American Indian had a groundless fear of the horses he had never before seen; many victories have

been won solely through them." The Spanish estimated the military value of a horse as equal to that of six Spanish soldiers, and, to keep up the natives' fear, forbade any one of them to ride. Similarly with the dog. "The help of the dogs in the conquest of America is likewise not to be underestimated. The natives had a fearful terror of these big bloodthirsty beasts which represented a cross in which the mastiff-type predominated. Accustomed to dumb or at least only howling dogs, they could not even listen to baying without falling into the greatest fright."¹⁰² It is said that the Indians regarded a dismounting horseman with terror, believing that a single being was separating itself into two parts before their eyes.¹⁰³ The same impression was made on the Herero, as one of their chiefs told Büttner;¹⁰⁴ while the natives were uncertain whether to flee or to defend themselves, the strange two-headed being separated into two parts, "an unknown quadruped and a man whose wide-floating mantle they had taken to be bird-wings." The horse was a marvel to the Indians and came to be regarded as sacred. For a long time it was worshipped by the Aztec and by most of the tribes was considered to have a mysterious or sacred character. "Its origin was explained by a number of myths representing horses to have come out of the earth through lakes and springs or from the sun. When Antonio de Espejo visited the Hopi of Arizona in 1583, the Indians spread cotton scarfs or kilts on the ground for the horses to walk on, believing the latter to be sacred. This sacred character is sometimes shown in the names given to the horse, as the Dakota *sínka wíkan*, 'mysterious dog.'¹⁰⁵ The Yakuts revered the horse, but for another reason: it was the basis of their self-maintenance.¹⁰⁶ The horse is a devil, according to a Roumanian folk-tale; its origin is as follows. Until the first human beings transgressed the law of God there was no horse; it appeared after the fall, when Adam and Eve were forced to work the land in the sweat of their brow. Adam started to work without asking God's blessing and help, and as fast as he ploughed the grass grew again. In despair he fell on his knees and cried: "Dear God, help me!" God heard his supplication and gave him the following advice: "Adam, take these two devils which I give to you; put them to the plough and work."¹⁰⁷

That horses have souls and a life hereafter is the belief of some historical peoples. At the close of their war with China, the Japanese consecrated with much religious ceremony a magnificent monument, at Tokio, to the memory of their horses lost in the campaign, while in 1905 grand funeral-services were held at Miyagi for the horses killed in the war with Russia. "In the presence of the Governor of the province, of Princes of the imperial family, and of all the leading military, civil, and religious officials of the nation prayers were recited by the clergy of the Buddhist and Shinto rites for the welfare and repose of the spirits of the horses that had given their lives in the service of their country during the conflict. Offerings of wheat and oats were placed on a large altar, and then the ranking General present delivered a memorial address while the troops stood at attention. . . . He solemnly thanked their spirits—that is to say, their souls—in the name of the Emperor, of the army, and of the nation for the assistance which they had afforded to their human comrades . . . and assured them that their names would be held in affec-

tionate and honored remembrance." It would seem that Alexander the Great entertained the belief in the hereafter of horses for, not content with entombing his favorite charger, Bucephalus, killed under him in battle, in a splendid mausoleum, he founded and built as a lasting memorial to him the city of Bucephala. Frederick the Great erected one of the most beautiful Lutheran churches in Prussian Poland as a memorial to his favorite charger. There are instances of animals being interred within Christian churches, including a favorite dog, a pet monkey, and a famous horse. The Duke of Wellington erected at his country seat a stately tomb for Copenhagen, the charger which he had ridden throughout the battle of Waterloo, when he remained no less than seventeen hours in the saddle without dismounting. The horse was buried with full military honors.¹⁰⁸

White Animals. A special cult-animal is one with a peculiarity or pronounced characteristic, like an albino or one of white color.¹⁰⁹ The Kavirondo in Africa use the feather from a white chicken to keep off hail and kill a white fowl to ward off disaster consequent upon killing a python.¹¹⁰ White fowls are fetishistic in West Africa also.¹¹¹ Some Malay tribes trace their descent to two white apes, and believe that the soul of the chief goes into them.¹¹² The Uncpapas gave a festival to the man who killed a white buffalo.¹¹³ The albino buffalo was sacred among all the close cognates of the Omaha and also among the Dakota tribes. Catlin mentions that the Mandan gave the Blackfeet the value of eight horses for a white buffalo-skin, which they deposited with great ceremony in their medicine-lodge. Personal names referring to the white buffalo occur in all the cognates.¹¹⁴ A white or black deerskin possessed a wonderful charm for the Hupa Indians of California. A chief whom the writer saw had three which had been handed down so long as family heirlooms that he did not know when they were acquired. "The possession of them had exalted him to such a pitch that no one crossing the river with him in a canoe could possibly be drowned, and one or more added to the store would make him 'all the same as God.'"¹¹⁵ White animals figure prominently in the religious ceremonies of the Tarahumari.¹¹⁶

For an oblation to Surya, the sun, the fee in Brahmanism was a white horse or a white bull, either of them representing the proper form of the sun.¹¹⁷ At Kubla Khan's hunting-castle is said to have been kept a herd of ten thousand snow-white horses whose milk only descendants of Genghis Khan and another favored class might drink. A yearly offering of milk from this herd was made by the emperor to secure the favor of the various spirits. Some tribes west of the Yenesei show especial veneration for white horses, never riding or driving them but offering them to their gods; they sacrifice dark horses to the evil spirits. In Siam the white elephant appears as a symbol of purity and light and plays a great rôle in worship; great rewards are offered for catching one, and his entry into Bangkok is made a national festival. Such a case occurred in 1926. The white elephant is really an albino. The God Indra rode on one.¹¹⁸

Mithra drove a high-wheeled chariot which was drawn by beautiful white horses.¹¹⁹ Sacred white horses were known to the Greeks and Romans, while such animals, used for purposes of divination, were pastured by the ancient Germans at public expense in sacred woods and groves.¹²⁰

§257. The Man-Fetish.

PROMINENT among physical peculiarities that have conferred fetish-character is albinism. The albino is usually regarded as something strange and inexplicable, to be respected and avoided. Albinos are not rare in D'Entrecasteaux, though they are seldom able to marry; no one wants them. This is especially the case with the males; the girls avoid them. "Their colour, or rather their want of it, is regarded as a physical deformity, and a legend of a great flood tells how it was stayed by an albino being cast into the water."¹ In the Congo region, albinos are rare and are regarded with respect; "although they may marry, there are many women who, through fear, refuse to have them. The skin is a dirty white with a tint of pink in it. The hair is curly and very light, and the eyes are red and intolerant of the light. They are repulsive looking, and one is glad to turn the eyes quickly in another direction."² Yet another writer³ on Africa says: "It used to make me homesick, in our little African clearing, to see the albino woman. . . . Homesick people are always longing for a visit, and that albino woman was so white!" Albinos are said to be treated no differently from the normal natives among the Ba-Mbala, yet this does not apply to other abnormalities, for the case is mentioned of a certain boy, who, though black, had red hair and brown eyes; "he was accused of being possessed by *Moloki* [evil spirits] and killed."⁴ On the island of Nias all albinos are regarded as children of evil spirits. If the mother gives it out that she was ravished by a spirit, she and her child are spared; but if the child appears like a normal child, it is regarded as no albino, the man whom it resembles is declared to be the father, and he and the mother are both executed.⁵ In Dutch Guiana albinos enjoy great honor.⁶ According to the Department of Anthropology of the American Museum of Natural History, the so-called "White Indians" of Panama are merely albino Indians. The albino population is despised and ostracized by the rest of the Indians.⁷

Any bodily peculiarity, atavistic or otherwise, may lead to the individual being regarded as possessed by a spirit. Six-fingered children are said to be more common among the negroes of the Gold Coast than in Europe, and because they were supposed to bring ill luck they were formerly exposed as a regular practice. Today they are made away with clandestinely.⁸ The birth of a child among the Bondel people of Africa is attended by many perils, for if a single condition regarded as unfavorable occurs, the infant is strangled at once. "Its life is in danger again at the time of teething, for it may be so incautious as to let its upper teeth protrude first, and if this is the case it is held unlucky, and will almost certainly be killed. Even if it is allowed to live it will be in perpetual danger, and any disaster that happens to its parents

will be attributed to it."⁹ According to newspaper accounts, Yuan Ke Huan was proclaimed by the people of China to be their next ruler because of the fact that he had three extra teeth.¹⁰ Foreigners, being strange and differing often considerably from the natives, have been regarded as of fetishistic character. The first non-negro from the outer world to penetrate into Uganda was a Baluch soldier from Zanzibar, who arrived at the court of the king about 1850. "His handsome face and abundant hair and beard won him royal favour." Known as "The Hairy One," he became a power in Uganda, and possessed a harem of three hundred women.¹¹ The whites on the Ivory Coast were feared not only on account of their intelligence and their superior weapons, but for the following reason as well: it was believed that the Europeans lived under the water, where they could not have any women; the natives therefore feared lest their own women would be taken away from them.¹²

Strange people, especially aborigines, have been pretty generally regarded as possessed. Strong¹³ was once about to cross the main range of mountains which form the backbone of New Guinea, when a native, trying to persuade him not to go, said: "On the other side of the range they are not men, but ghosts who, like birds, live on the tops of rocks and hills." The people proved to be ordinary natives, living on the peaks and ridges of stony mountains. The Chinese, who are the conquering race in Yunnan, look upon the natives with some dread and credit them with powers of witchcraft, partly because of the fact that they are pygmies. "It struck me that in Yunnan one can now observe a similar state of things to what may have existed in Britain and Ireland when a primitive pigmy population, driven into the mountain wilds and woods by their conquerors, and displaying similar characteristics of elusiveness and uncanniness, may have given rise to the fairy legends."¹⁴ There are a number of similar examples in the Malay Peninsula. If the Jakun hates and fears the Malays, the Malays in return both despise and fear the Jakun. "The Malays consider the Jakun as infidels, and therefore despicable, and as being in a rank only a little higher than animals; but on the other hand the Malays themselves are superstitious in the extreme. For Malays, everything they do not understand is a mystery; everything not common must be endowed with extraordinary virtue; and consequently, to a Malay, a Jakun is a supernatural being, endowed with supernatural power, and with an unlimited knowledge of the secrets of nature. He must therefore be skilled in the arts of divination, sorcery, and fascination, and able to do either good or evil according to his pleasure; his blessing will be followed by the most extraordinary success, and his curse by the most dreadful of disasters. . . . Moreover, to a Malay the Jakun is a man who, by his nature, must necessarily know all the properties of every plant, and consequently must be a clever physician, a belief which explains the eagerness of Malays who are sick to obtain their assistance, or at least to obtain some medicinal plants from them. . . . Such are the effects of Malay superstition; and this is the reason why though they despise the Jakun they at the same time fear them, and will in many circumstances refrain from ill-treating them." All branches of the Sakai tribes, as is usually the case with autochthonous races, are credited by the immigrating Malays with the knowledge of charms of the most marvellous potency. By means of "sendings," or rather "pointings," they are believed to be able to slay their

enemies at a distance, and "many a Sakai has paid the penalty for sickness and trouble falsely ascribed to his malevolence by excited and not overscrupulous Malays." The authors¹⁵ are of the opinion that the very circumstance of these tribes remaining unconverted is probably a principal cause of the belief crediting them with the possession of unhallowed powers. "In no country where new creeds are received is there a total immediate abandonment of the ancient ones. So long as the existence of the old gods and demons of the land is believed in there will always be multitudes ready either to ask their aid or deprecate their wrath, in spite of the fact that they believe it sinful to do so. To this day neither Hinduism, Islamism, nor Christianity itself have totally extinguished the ancient superstitions of the countries where they prevail. And this same unreasoning fear of the aborigines has doubtless in numberless cases operated more powerfully in their defence than the best of laws could have done."

Among the early Greeks, to the imagination of the conqueror the conquered are at once barbarians and magicians, monstrous and magical, hated and feared, craftsmen and medicine-men, demons, beings endowed like the spirits they worship. "The conquerors respect the conquered as wizards, familiar with the spirits of the land, and employ them for sorcery, even sometimes when relations are peaceable employ them as foster-fathers for their sons, yet they impute to them every evil and bestial characteristic and believe them to take the form of wild beasts. The conquered for their part take refuge in mountain fastnesses and make reprisals in the characteristic fashion of Satyrs and Centaurs by carrying off the women of their conquerors."¹⁶ The same situation prevailed among the early Scandinavians. As late as the eleventh century the less civilized tribes in the mountains of Sweden and in the farthest north of Norway were called by the bards by such terms as giants, mountain-wolves, sons of the cliffs, cave-people. They were thought to be strong in witchcraft and necromancy and to know what was going on in any place in the world, to be able to bring whales ashore, and to do all the sorcery described in books.¹⁷ It is a modern superstition that objects made by blind people bring good luck.¹⁸

Any mental disease or disorder marks a person as exceptional and to the savage is evidence of possession by a demon. Mental diseases are by no means confined to civilized people. Crawley¹⁹ finds hysteria common among the Votyaks, Hottentots, Javanese, Brazilians, Mexicans, Peruvians; Bastian²⁰ states that hysteria and neurotic diseases are frequent among savages; while Brinton²¹ mentions cases of such among the Iroquois and Hurons, the natives of New Zealand and Madagascar, and the Kaffirs, Abyssinians, and West Africans. Additional evidence of the prevalence of mental and nervous disorders among primitive peoples is given in the following examples, selected chiefly to illustrate the attitude taken toward such possessed persons.

"A savage in a temper," writes Abel²² with special reference to the natives of New Guinea, "is one of the most distressing sights it is possible to witness. As a rule, however, the fury expends itself in violent abusive speech. I have seen both men and women possessed by devils. There could be no other way

of describing the raging emotion which governed them, until it subsided from sheer exhaustion. As a relief to pent-up passion, a man will sometimes attack his house. Snatching up his axe, between the diabolical yells in which he flings his vituperative imprecations at his wife, he hacks away at his house, tearing up the floor, and hurling it in his frenzy as far as he can scatter it in all directions." In the Upper Congo, when a man is "on the drink" he sticks a leaf in his hair to show it, and then no notice is taken of any stupid or insulting remarks he may make.²³ He is possessed by spirits and so is not accountable for his actions. According to native West African beliefs, apoplectic and epileptic fits, hysteria, delirium, and mania are phenomena connected with the absence of the indwelling spirit of man; "but they do not directly result from its departure, and are caused by a spirit without a bodily tenement entering the body during the absence of the proper tenant, by the struggle between the two when the latter returns and finds his place usurped, or by the former trying to force a way in and displace the latter—they are in fact cases of 'possession.'"²⁴ Stuhlmann²⁵ found a number of huts in which women were treated for hysterical convulsions, the means of therapy consisting of cooking meat and beating a drum to drive out the devil spirit. Among the Nigerian head-hunters, "if a child be an idiot or unable to move about, it may be thrown into the water, '*but not killed.*' This usually happens when the child is between the ages of one and four, but in some cases he may be given a much longer time in hope that he will recover. 'It is evidently a snake and not a human being. If after you have thrown him (or her) into the water you go away and then come back silently and hide yourself, you will see the child lengthen out into a snake.'"²⁶

Mental disorders are common among the Siberians and the Hyperboreans generally, and appear to be more so the farther north one goes. The various phenomena of possession are evident and there are cases of whole tribes being affected by contagion and suggestion.²⁷ Miss Czaplicka²⁸ has made a careful investigation into this matter; excerpts from her study follow. "Unintentional visual suggestion shows itself in cases in which, when some of the younger people begin to dance, all the villagers, even the oldest, follow their example. Jochelson reports an instance of an old woman quite unable to stand alone, who on such an occasion stood up and began to dance without assistance until she fell exhausted. . . . Sometimes people who suffer from arctic hysteria are peculiarly susceptible to hypnotic suggestion, which, however, they receive while awake. Not only auditory, as in the case of the ordinary hypnotic trance, but also visual impressions are received by the patient as suggestions." It is affirmed that many Samoyeds, Laplanders, Tungus, inhabitants of Kamtchatka, and in a less degree the Tartars about the Yenisei, are occasionally "panic-struck"; an unexpected touch, a sudden call, whistling, or a fearful and sudden appearance will throw these people into a state of fury. "The Samoyed and the Yakut, who seem more to be affected in this way, carry the matter so far that, forgetting what they are about, they will take the first knife, axe, or other offensive weapon that lies in their way, and would wound or kill the object of their terror if not prevented by force and the weapon taken from them; and if interrupted will beat themselves about the hands and feet, scream

out, roll upon the ground and rave. The Samoyed and the Ostyak have an infallible remedy to bring such persons to themselves; which is, to set fire to a reindeer-skin, or a sack of reindeer hair, and let it smoke under the patient's nose; this occasions a faintness and a quiet slumber, often for the space of twenty-four hours." Fits of *menerik*—the Yakut term for a type of mental disease—are usually brought on by a shock or sudden pain, though sometimes the malady is periodical and comes on without any apparent immediate cause. "The patient is afflicted with spasms, or falls into a trance, howls or dances, and sometimes this ends in an epileptoid seizure. The natives ascribe this disease to the influence of evil spirits and it is curious to note that this influence is in most cases of foreign origin. A Yakut patient will sing in Tungus and a Yukaghir in Yakut, even if they do not speak these languages. The fits are often followed by a prolonged sleep lasting for several days." These hysterical seizures have been observed chiefly among young girls and some young men, especially those under training for shamanship. There is said to be scarcely any Yakut woman who is not more or less liable to hysteria. Another common disease is called *ämürakh* in Yakut and by other terms among other tribes. As the linguistic evidence shows, the first symptom of this disease is the marked impressionableness of the patient, his feeling of fright and timidity. He usually shouts the most obscene words or rushes at the cause of his terror; there is also an inclination to repeat all visual and auditory impressions. *Menerik* and *ämürakh* are met with most often among the peoples who have more recently come into the Arctic region, the Yakut, the Tungus, and some of the Russian settlers; while among the peoples longer domiciled the other nervous ailments such as melancholia or inclination to suicide are apparently more frequent. "In all cases the nomadic or reindeer peoples have less liability to this form of disease; but this may be due not only to their mode of life, but also to the fact that the reindeer-breeding peoples are better situated materially, and, except as the result of some occasional catastrophe, do not suffer so much hardship. Thus we know that during a famine sometimes half the inhabitants of a village become insane, temporarily or permanently." The term "arctic hysteria" has been given by travellers partly to religio-magical phenomena and partly to the nervous ailments which are considered by the natives to be a disease. A review of the various symptoms brings Miss Czaplicka to the opinion that nearly all cases described can be regarded as instances of hysteria. "But most of the symptoms enumerated are met with in Europe, and therefore the majority of these cases cannot properly be described as *arctic* hysteria. There is no question that the economic and geographical conditions of the arctic region lead to the development of nervous diseases, but since such ailments are met with in other geographical areas, it is clearly incorrect to class them as distinctly 'arctic.' Yet not all of the symptoms described are familiar to Europeans. Quite unknown among us is *ämürakh*, the imitative mania with its characteristic symptom of imitating unconsciously all gestures and sounds. . . . This peculiar form of the malady probably suggested to travellers the name of 'arctic hysteria,' and convinced them that all hysteria in the Arctic region differs from that prevalent in Europe and is, in fact, peculiarly 'arctic.' The use of the term 'arctic' seems appropriate enough at first sight, as nearly all travellers ascribe these hysterical maladies to arctic conditions, namely, dark winter days, light summer nights, severe cold, the silence, the general monotony of the landscape, scarcity of food, etc. The observed fact that these nervous diseases are especially fre-

quent in the dark season, or in the time of transition from one season to another, points to the same conclusion. But unfortunately for this hypothesis we find the same symptoms which are held to be characteristic of Arctic lands among the peoples of the Equatorial regions." The author cites a number of cases of similar nature, chiefly from among the Malays, and comes to the conclusion that it is not so much the Arctic climate as extremes of climate which account for this peculiar type of hysteria, and suggests that the title "arctic hysteria" be discarded in favor of "hysteria of climatic extremes." The racial factor is also of importance. The general conclusion of this study is that the whole of northern and part of southern Siberia is a region where the people suffer from nervous diseases more than in any other of the known regions of the world. "Thus only in this region is such an institution as that of 'voluntary death' looked upon as praiseworthy and there only do such hereditarily hysterical individuals as the best shamans certainly are enjoy the highest consideration."

Among certain clans of India, spirits were thought to speak through a certain girl, who was often ill and who used to go into trances.²⁹ There is a Malay game of turning into a civet cat, in which a boy is actually hypnotized and caused to behave like that animal, becoming, as the Naga were-leopard does, much exhausted when the trance is over. Skeat³⁰ records the inverse of the Naga case, in the process by which a possession of the human body by a tiger-spirit is invoked in order to cast out another and less powerful possessing spirit, and also the induction of a monkey-spirit into a girl who, while thus possessed, is capable of the most remarkable climbing feats. "In some cases lycanthropy among Nagas seems to be hereditary, or perhaps rather one should say that a tendency towards it may be inherited, as in the case of many diseases; and indeed Mr. Baring-Gould described lycanthropy as a disease, associating it in this respect with the mania for cattle-maiming and with a morbid desire to devour human corpses. Cases of both of these I have met with in the Naga Hills, the latter, however, being regarded by the Nagas themselves as symptomatic of extreme insanity; whereas the former is, like lycanthropy, merely a vice which is liable to be very troublesome to the neighbours of those that practise it."³¹

Imbeciles among the Zuni are regarded as being in intimacy with good spirits; hence their words and actions are regarded as signs of divinity and their doings and sayings are oracular.³² This concept, including under it mental disease as well as mental defect, was well known to the ancients; in Biblical times mental aberrations were interpreted as being caused by possession, the treatment being the casting out of the evil spirit.³³ Most religions have been founded by epileptic, eccentric, or insane men and women, while a number of religious communistic societies have been established, especially in the United States, under the leadership of abnormal persons, many of whom have regarded themselves as reincarnations of Christ, in his second advent.³⁴

There are other examples of the fetish-man, leading up to the god-man, usually priest or king, who is divine. Among the Ba-Mbala of East Central

Africa is a class of men called *Muri*, whose existence can be explained only through fetishism. They may not eat human flesh nor the flesh of fowls, though the tribe is cannibalistic; they are distinguished by a fine iron bracelet and a head-covering of cloth. Great importance is attached to both these ornaments; to remove or appropriate either is punishable by death.³⁵ It is not admitted by the Fan that a man's being struck by lightning is a case of accident; it is someone's vengeance working through spirits. The deceased is deprived of all funeral-rites.³⁶ In the Congo a person may unknowingly be "full of witchcraft" and cause sickness and death to others; of course it is the evil spirit within him that does the damage. Chiefs, headmen, and freemen are more shabbily dressed than slaves for the reason that they are not anxious to display their wealth for fear of being charged with witchcraft.³⁷ Twins are regarded by the Hausa as possessing powers out of the ordinary. "If a twin licks his finger and rubs it over the bite of a scorpion, the pain ceases immediately. If a twin is angry with you and stares into your eyes, you will lose your eyesight until you have appeased him. Do not curse a twin, for if you do, the evil will recoil upon yourself. In fact everything will go wrong with you. . . . There seems to be no doubt that the fear of twins is due to their rarity, a double birth being regarded as strange, and even terrible."³⁸ The only explanation to the natives is spiritual agency.

"The divine person," comments Frazer,³⁹ "is a source of danger as well as of blessing; he must not only be guarded, he must also be guarded against. His sacred organism, so delicate that a touch may disorder it, is also electrically charged with a powerful spiritual force which may discharge itself with fatal effect on whatever comes in contact with it. Hence the isolation of the man-god is quite as necessary for the safety of others as for his own." An extreme case of sanctity is that of the chief of a Russian tribe who was so holy that he was not allowed to walk.⁴⁰ In India "the priest has long been regarded as a god, but in the epic he is god of gods, although one can here trace a growth in adulation." The king has also been identified with the gods; in the epic he is to his people an absolute divinity.⁴¹ Mina Fu-yeh is regarded as the reincarnation of Buddha, and is now in his twenty-second lifetime. "This is, of course, only since he became an incarnate saint; there are no records of his previous lives. Sakya Muni had altogether 551 lives, 510 of which were prior to his becoming a saint."⁴² "His Sublimity," the Dalai Lama of Tibet, was not raised to the throne by the usual ballot method: while an infant he was brought to Lhasa with two other babes, all of whom were regarded as incarnations of the Dalai Lama. Subsequently the Regent Lama and the ministers of state of that time had reason to consider that two of the infants were devils incarnate and that the third was the only genuine incarnation of the Dalai Lama.⁴³

The Sumatrans are firmly persuaded that various particular persons are sacred and invulnerable.⁴⁴ Captain Cook was first treated by the Hawaiians as a god, and then was killed in a fight following the breaking of a native taboo. "His body was taken to a small heiau on the cliffs above Kaawaloa Bay and there the flesh was stripped from the bones which were deified and tied

up with red feathers and subsequently hidden."⁴⁵ A cartoon of President Cleveland in *Judge*, representing him as a friar with a halo, was obtained by a native Filipino who framed it and offered evening petitions to it.⁴⁶

The Chaldean king on his accession was invested in the temple, according to the rites of his god. After that his time was consumed in minute devotions, being the homage which he paid to his lord. He was comparable to a steward, rendering accounts to his lord day by day.⁴⁷ The people had the highest interest in this because any defect or error in the performance of duties by the king would bring calamity on the nation.⁴⁸ Among Mohammedans the Iman or prince unites in his person supreme spiritual and temporal power; he is infallible and sinless, the incarnation of Logos, the divine Word.⁴⁹ Notions similar to the above two cases were held during the Middle Ages.⁵⁰ Man as the "image of God" is a fetish. The human body as a temple for the dwelling of good and bad spirits is a concept found in the New Testament.⁵¹ All kings ruling by divine right, ecclesiastics claiming to be God's vicegerents on earth, and other "Men of God" are outgrowths of the man-fetish idea.⁵²

§258. Ecstasy and Inspiration.

Fox and Drew¹ once witnessed a case of possession, that of a Banks Islands boy about eighteen years old, who complained of headache, went to sleep, and after about three hours became "possessed" and inspired. "He was extraordinarily strong, about eight men, most of whom were powerful fellows, endeavouring vainly to hold him. In the intervals of these violent paroxysms he spoke, certainly in a voice quite unlike his own. A compatriot, staring into his eyes, said to him, 'What is your name?' 'We are many,' replied the possessed boy. 'Is it so and so in you?' to which the possessed replied 'Yes' or 'No' till it was ascertained who were in him (various dead natives, some of whom were known to the writers). He was then asked for news of friends in other islands. Some inquiries he answered (his answers proved to be wrong in some cases). . . . Other inquiries he did not answer, saying, 'None of us have been there lately.' All this time he was exceedingly strong, and sometimes violent, and apparently insensible to pain. In about an hour he suddenly appeared to come to himself, staring wildly round, asking where he was and what we were round him for. After a long sleep of some 12 hours he appeared to be normal again." When the *atua* or ghosts of their ancestors are invoked by the Tikopians, it is not known who of those present will be inspired and all wait patiently for this to happen. "When the selected person begins to shake, betel is presented and questions are put to find out whether the sick man will recover, etc. . . . If the sick man becomes worse and the ghost is again invoked, the possessed man will on this occasion say definitely whether the patient will die or recover and will never come more than twice. If a favourable verdict is given, the man recovers and makes a large present of food to the man whom the ghost has entered."² Similar phenomena of posses-

sion have been observed in Papua.³ There is evidence in all this of the close connection between the religious and the abnormal.

Among the Yaos of Central Africa, madness, idiocy, and the ravings of delirium or disease are accounted for by the agency of spirits, *masoka*. "The sufferers are *wa masoka*, they of the spirits, and a sudden fit of epilepsy or insanity is described as *gakamwile masoka*, the spirits have seized him. Such persons are usually regarded with awe, as living in close contact with the unseen. . . . Idiots and the insane are allowed to wander at will about the village, and only when violent symptoms show themselves as a danger to the community is any physical restraint put upon them. The *masoka* are also recognized as the inspiring agencies in the ravings of the witch detective."⁴ The most common manifestation of the spirits in East Africa is madness, temporary and permanent. "The former is most usually seen during dances performed by women, and takes the form of a kind of trance but accompanied by convulsive movements of the body; women in such a state often utter gruesome cries and shed copious tears. . . . The possession is supposed to abate by the application of ghee to the head and shoulders. . . . It is very rare that a man is possessed by spirits; I have, in fact, only seen two cases of this, and it is said that a man so afflicted is always a medicine man or will become one."⁵ How possession may be induced, and how the possessed person acts, are seen also in the case reported concerning the Hausa: "Ayesha sat upon a cushion in front of a pot of incense, and began to inhale it, meanwhile rubbing her right hand to and fro on the floor (the palm up) in order to salute the bori [spirits] in the ground, and also to show when they had taken possession of her, i.e., when she had lost her senses. . . . Soon Haja Gogo began belching (because the bori were passing her by, leaving her at once), and Ayesha belching and yawning (some passing by, some entering). . . . Ayesha's yawns grew in number and intensity, and the movement of her hands more and more erratic. . . . Immediately Ayesha (or, rather, the bori in her) began roaring and wandering about on her knees, cursing and laughing foolishly."⁶

An important example of the inspired person or medium is that reported by Weeks⁷ of the Bangala in the Congo; it emphasizes the importance of religion as a disciplinary factor, even when the person in question is a fakir or tries to utilize religious practices and beliefs to his own aggrandizement. "Bololi, the headman of his family, died and was buried in the usual way. Some time after his younger brother, Mangumbe, became subject to frenzies, during which his brother Bololi spoke his oracles through him. Mangumbe admired and coveted the wives of a certain man in his town, and he tried to buy them, and failing that to exchange others for them, but their husband refused all offers. One day Mangumbe worked himself into a frenzy, and when he was supposed to be under the sway of his brother's *mongoli*, he said: That a certain man (giving the name of the man whose wives he coveted) must get rid of his wives or they would encompass his death by a serious and fatal illness. Then Mangumbe went to a friend and told him to treat with the husband for the wives, and the husband, thoroughly afraid now of his wives, was quite willing to sell them at a cheaper price than Mangumbe had previously offered for them." Such was possible because "the people firmly believed that Man-

gumbe held counsel with his brother's *mongoli*, and when he acted as a medium they were quite willing to believe all he said. Ordinarily he was little respected by the people; he was of mean appearance, and of petty, shabby ways, and had no command over even his own people, and yet when acting as a medium in a *séance*, he was feared, obeyed, and his word accepted without the slightest demur."

Examples of "inspiration" which take the form of a call to preach have been numerous among the American negroes. Booker T. Washington⁸ has described the process as follows: "In the earlier days of freedom almost every coloured man who learned to read would receive 'a call to preach' within a few days after he began reading. At my home in West Virginia the process of being called to the ministry was a very interesting one. Usually the 'call' came when the individual was sitting in church. Without warning the one called would fall upon the floor as if struck by a bullet, and would lie there for hours, speechless and motionless. Then the news would spread all through the neighbourhood that this individual had received a 'call.' If he were inclined to resist the summons, he would fall or be made to fall a second or third time. In the end he always yielded to the call." The recounter suspected, however, that the call often came because of a desire to avoid work, the chief ambition of many negroes being to get an education so that they would not have to work any longer with their hands. "This is illustrated by a story told of a coloured man in Alabama, who, one hot day in July, while he was at work in a cotton-field, suddenly stopped, and, looking toward the skies, said: 'O Lawd, de cotton am so grassy, de work am so hard, and de sun am so hot dat I b'lieve dis darcy am called to preach!'"

Frenzy, hysteria, and other abnormal psychological manifestations are features accompanying "possession" in India and among the Malays. A definite way in which the gods of the Todas are believed to intervene in human affairs is in divination. "During the frenzy into which the diviners fall they are believed to be inspired by the gods."⁹ When a girl among the Nairs is thought to be possessed of the devil, masked magicians come before her and execute frightful dances to the accompaniment of terrifying music. "Dancer succeeds dancer, each more terrible looking than his predecessor, and the poor girl loses control of herself and falls into a sort of hysteria, in which the devil in her confesses where it came from and who prompted it." The whole scheme of the dance—the music, the masks, the lighting—seems to be arranged with the sole purpose of rendering the subject liable to suggestion.¹⁰ The effect of the dance in inducing possession is seen in a case reported from Manipur: "While the last portion of this dance was proceeding, one of the attendants began to dance wildly, and after going through most extraordinary contortions, reeling about as if drunk, he fell down and was dragged to the front of the shrine and placed there kneeling with his head on the ground, and remained there for some time shaking with emotion. Khumlangba had entered into him. . . . On the next day the second Maibi became possessed. She danced wildly, staggered about shaking her head, for the Lai is supposed to sit on the head of his devotee, then she knelt before the shrine, and trembling all over, shaking her head, began a long series of babblings, which were said to be prophecies."¹¹ Somewhat similar ceremonies leading to physical and mental collapse occur

⁸ *Up From Slavery*, 82, 128.

⁹ Rivers, *Todas*, 450.

¹⁰ Panikkar, in JAI, XLVIII, 281.

¹¹ Shakespear, in JAI, XL, 356.

among the Singhalese.¹² Wilken¹³ describes as follows the inspiration of the seers in Buru: the ghost-seers light a little incense before them while they sit in a squatting posture on the ground; after a while their feet and hands and later their whole bodies are thrown into a violent, nervous, twitching movement, while they begin to mumble in a singing fashion words that cannot be understood. This is a token of the approach of the spirits. Then they begin to jump and dance to the measure of the music, an indication that a spirit has now possessed its medium. "It is a frightful sight to see the seer then, with loose-hanging hair and twisted features, leaping about until he falls senseless to the ground." When he comes to again, the questions to be answered by the spirits can be put to him. Evans¹⁴ once had a Dusun woman ascertain for him by divination whether he would have a successful journey; he jotted down the following notes at the time, while observing the performance: "She starts singing in a quavery voice, then begins to quiver and shake as if convulsed with fever—pants—sings loudly—makes hysterical noises—moves her feet—jumps about with both feet together, first backwards, then forwards—stamps about—sings—talks in an hysterical voice—pants—calls, 'Adohi! Adohi!'—runs round and round—goes on all fours—sits—pants—sings—stands up—trembles—sings—jumps about with both feet together and does a few dance steps." In Nicobar *fai* means inspired, quaked, or felt; a person who, in the first stage of recovery from a severe illness or from a delirious attack, informs his people that he has been inspired or has quaked, becomes a *Máfai*. Friends and relatives come with presents to the inspired man. "From this time forward, and until he thoroughly recovers, the people of the village and other friends and relatives contribute his meals and other necessities by turn. . . . The people venerate him much and take him at midnight to all sick quarters that he might heal them by his touch or shampooing, and he pretends to remove gravel or stones from the body of the invalid whom he shampoos." This is done until the *Máfai* think that he is strong enough to work for his food, when he resigns his *Máfai*-ship with a ceremony which literally means "undressing the *Máfai*."¹⁵ Throughout the Malay Peninsula may be observed cases of mental derangement similar to "arctic hysteria," more commonly among women than men. Sir Hugh Clifford,¹⁶ who has given a full description of such occurrence, termed *látah*, thinks that every adult Malay is to a certain extent affected. One of the chief characteristics of *látah* is that the sufferer apes all the actions and gestures of the person he is observing.

Among the peoples of classical antiquity priests and priestesses brought themselves to ecstasy before giving their oracles.¹⁷ The worshippers of Dionysus believed that they were possessed by the god. It was but a step farther to pass to the conviction that they were actually identified with him, actually became him. "This was a conviction shared by all orgiastic religions, and one doubtless that had its rise in the physical sensations of intoxication. . . . The savage doctrine of divine possession, induced by intoxication and in part by mimetic ritual, was it would seem almost bound to develop a higher, more spiritual meaning. We have already seen that the madness of Dionysos included the madness of the Muses and Aphrodite, but, to make any real spiritual

advance, there was needed it would seem a man of spiritual insight and saintly temperament, there was needed an Orpheus. The great step that Orpheus took was that, while he kept the old Bacchic faith that man might become a god, he altered the conception of what a god was, and he sought to obtain that godhead by wholly different means. The grace he sought was not physical intoxication but spiritual ecstasy, the means he adopted not drunkenness but abstinence and rites of purification."¹⁸ The scenes of initiation into the mysteries of Mithra were calculated to produce a profound impression on the neophyte: "The sacred emotion with which he was seized lent to images which were really puerile a most formidable appearance; the vain allurements with which he was confronted appeared to him serious dangers over which his courage triumphed. The fermented beverage which he imbibed excited his senses and disturbed his reason to the utmost pitch; he murmured his mystic formulas, and they evoked before his distracted imagination divine apparitions."¹⁹ Instances of trance and vision are described in the Avesta.²⁰ Among the ancient Jews, seers and prophets of Jahweh were fitted for the exercise of their office by such inward working of his spirit that they were thrown into an ecstatic condition. It was not in man's power of his own initiative to effect the call to be a prophet or to complete it by his own determination; and, on the other hand, he had no power to evade it. Conditions of ecstasy are mentioned which rise to rapture and holy frenzy. Scriptural descriptions,²¹ taken with the etymology of the word, show that we have to do with bands of enthusiasts, upon whom the spirit of God has laid hold with overpowering force and who, stimulated by loud music to greater frenzy, readily carry along others to participate in their conduct. "It reflects truly the character of such phenomena, as does also the statement that Saul stripped off his clothes, and lay naked for a day and a night in holy frenzy."²²

§260. Totemism (Religious Aspects).

TOTEMISM is reported from the whole of Australia, from nearly the whole of North America, from many regions of Africa, and from several isolated locations in India and elsewhere. Alleged survivals of the system have been identified, to their own satisfaction, by authors who have written concerning this or that savage tribe or ancient people.¹ We are here interested in the characteristics of the system rather than in its distribution; the latter can be made out, however, from the series of cases cited here and in the text.

Australia. "In every tribe without exception there exists a firm belief in the reincarnation of ancestors"; whether the system of descent is maternal or paternal does not affect this situation. The general idea is that in the Alcheringa, or earliest traditional time, or "dream time," "there existed at first a comparatively small number of individuals who were half-human, half-animal or plant. How they arose no one knows. . . . These semi-human creatures were endowed with far greater powers than any living men or women possess. They could walk about either on the earth or beneath it, or could fly through the air.

They were the ancestors of the different totemic groups." These ancestors are reincarnated over and over again. When a man dies, his spirit "goes back to the place at which it was left by the ancestor in the Alcheringa. . . . Here it remains for some time, but sooner or later it is reincarnated," by entering the body of some woman. As will be seen in a later connection, it must enter a woman of the proper totem.²

Typical of the usages connected with the totem are the following, practised by the Arunta tribe: "(1) That, except on one particular occasion, the members of the totem eat only very sparingly of their totemic animal. A very strict man will not even eat sparingly. (2) That the men of the totem perform a very definite ceremony, the sole object of which is that of securing the increase of the totemic animal or plant. (3) That the Alatunja especially, who presides over and conducts the ceremony, *must* eat a little or else he would be unable to perform the ceremony with success. (4) That after the men of the totem have eaten a little they hand on the rest to the other men who do not belong to the totem, giving them permission to eat it freely. (5) That only men of the totem and right moiety of the tribe are allowed to take any share in the actual ceremony, except in very rare cases." Certain tribes "believe that the members of each totemic group are responsible for providing other individuals with a supply of their totemic animal or plant. . . . If a water totem man be quite alone, then there is no objection to his drinking water with which he provides himself, but, so long as he is in the company of other men belonging to other totems, he must not obtain it for himself, but receives it from some individual who belongs to the moiety of the tribe of which he, the water man, is not a member. As a general rule, a man of the water totem receives this, when in camp, from . . . a man who belongs to the same class as his wife does." The complications of this matter may be judged from the following. "There is a fundamental difference between the relationship supposed to exist in the case of a man's own totem and that of the totems associated with his own moiety and, on the other hand, the totem of his mother. The latter he will eat *if it be given to him by a member of the moiety with which it is associated*. If it be his own, or his father's or father's father's, then he will not eat it at all; but if this restriction does not apply, then a man will only eat a particular animal or plant which is associated with a totemic group belonging to his own moiety of the tribe *if it be given to him by a man belonging to the other moiety of the tribe*."³

Among the beliefs about the entrance of a soul into a woman,⁴ the following are found: "The ancestor of the black-snake totem, for example, arose in a water hole on the Tennant creek; he wandered over the country performing ceremonies, making creeks and hills, and leaving all along his tracks plenty of black-snake children who are now resident in the rocks around the water-holes and in the gum-trees which border the creek. No woman of the present day will venture to strike one of these trees with a tomahawk, as she is firmly convinced that this would have the effect of releasing one of these spirit children, who would immediately enter her body. . . . Certain trees and stones . . . are supposed to be full of bee and goshawk spirits. The snake totem belongs to one moiety of the tribe and the bee and goshawk to the other, and the natives told us that the snake-man's wife could not possibly conceive a bee or goshawk

² Spencer and Gillen, *North. Tr. Cent. Aust.*, 145, 148, 149, 153, 157, 576.

³ Spencer and Gillen, *North. Tr. Cent. Aust.*, 291, 167, note.

⁴ §334, below.

child there, because no such spirit would think of going inside the wife of a snake man. If she were to conceive a child at that spot it would simply mean that a snake spirit had followed the father up from his own place and had gone inside the woman . . . the natives are very clear upon the point that the spirit children know which are the right lubras [unmated women] for them . . . to enter, and each one deliberately chooses his or her own mother." It is to be noted that there are objects of stone or wood, called *churingas*, which may be covered with devices representing the totem and which are kept in a sort of sacred deposit. "It is certainly a rather curious thing that, with the exception of . . . two rather vague and unsatisfactory ones, the natives have not, so far as we could find out, any myth which pretends to explain what is after all one of the most striking features in connection with the totems, and that is the restrictions which apply to eating it at the present day. There is no attempt made to bridge over the wide gulf intervening between the Alcheringa times, when their ancestors are supposed to have eaten it freely, and the present when, excepting just at the time of Intichiuma [a ceremonial], each totem is practically tabooed to the members of the group to which it gives its name." A man "will not hesitate, under certain conditions, to kill his totem animal, but he hands it over to men who do not belong to the same totemic group, and will not think of eating it himself. The fundamental idea, common to all of the tribes, is that men of any totemic group are responsible for the maintenance of the supply of the animal or plant which gives its name to the group, and that the one object of increasing the number of the totemic animal or plant is simply that of increasing the general food supply."⁵

The authors quoted⁶ find much the same conditions in other districts. "In some tribes there is a sex totem, in others there is no such thing; and in isolated cases we meet with an individual totem distinct from the totem common to a group of men and women. . . . In many Australian tribes it seems to be a general custom that a man must not eat or injure his totem, whereas amongst the Arunta there are special occasions on which the totem is eaten, and there is no rule absolutely forbidding the eating of the totem at other times, though it is clearly understood that it must only be partaken of very sparingly." In the Alcheringa there lived ancestors who, in the native mind, are so intimately associated with the animals or plants the name of which they bear that an Alcheringa man of, say, the kangaroo totem, may sometimes be spoken of either as a man-kangaroo or as a kangaroo-man. The identity of the human individual is often sunk in that of the animal or plant from which he is supposed to have originated. The totemic system of the Central Australian tribes "is based upon the idea of the reincarnation of Alcheringa ancestors, who were the actual transformations of animals and plants, or of such inanimate objects as clouds or water, fire, wind, sun, moon, and stars. To the Australian native there is no difficulty in the assumption that an animal or a plant could be transformed directly into a human being, or that the spirit part which he supposes it to possess, just as he does in his own case, could remain, on the death of the animal, associated with such an object as a Churinga, and at some future time arise in the form of a human being."

In connection with totemic religious rites there is a sort of sacrament. "The

⁵ §249, above; Spencer and Gillen, *North. Tr. Cent. Aust.*, 159, 160, 162, 169, 174, 276, 278, 323, 327.

⁶ *Nat. Tr. Cent. Aust.*, 35, 36, 73, 119, 124, 125, 127.

name *Intichiuma* is applied to certain sacred ceremonies associated with the totems, the object of which is to secure the increase of the animal or plant which gives its name to the totem. . . . We find amongst these tribes no restriction according to which a man is forbidden to eat his totem, as is stated to be the case amongst certain other Australian tribes. On the contrary, though he may only under ordinary circumstances eat very sparingly of it, there are certain special occasions on which he is, we may say, obliged by custom to eat a small portion of it or otherwise the supply would fail. These occasions are those on which the *Intichiuma* ceremonies . . . are performed." Herein lies the idea of the sacrament or communion. In the ceremony it is sometimes the chief performer who must eat a portion of the totem to prevent failure. "There is however one notable exception to the restrictions upon eating, and this is concerned with the Achilpa or wild cat totem. Only a very little of this is allowed to be eaten, and that only by the old people; but in this case the restriction is not confined to the members of the totem, but is of universal application, applying to every member of the tribe. . . . In the first place, it is supposed that any one, save an old man or woman, eating Achilpa would be afflicted with a special disease called *Erkincha*; and in the second, it is believed that if any man who had killed another at any time of his life were to eat this particular animal, then his spirit part or *Yenka* would leave his body, and he would soon be killed by some enemy, so that to a man who has ever killed another—and there are very few men who do not lay claim to this distinction—the Achilpa is tabu or forbidden for life, no matter what be his age." Returning to the *Intichiuma*, and "taking the tribe as a whole, the object of these ceremonies is that of increasing the total food supply."

Characteristic of the *Intichiuma* is copious blood-letting by the medicine-man and his sons, or others; in one case, where the central fetish was a stone in a pit, "before the ceremony commences, the pit is carefully swept clean by an old Unjiamba man, who then strokes the stone all over with his hands. When this has been done, the men sit around the stone and a considerable time is spent in singing chants, the burden of which is a reiterated invitation to the Unjiamba tree to flower much, and to the blossoms to be full of honey. The old leader then asks one of the young men to open a vein in his arm, which done the blood is allowed to freely sprinkle over the stone, while the other men continue the singing. The blood flows until the stone is completely covered, the flowing of blood being supposed to represent the preparation of Abmoara, that is, the drink made by steeping the flower in water, this being a favorite beverage with the natives. The ceremony is complete when the stone is covered with blood. . . . The totem of any man is regarded, just as it is elsewhere, as the same thing as himself; as a native once said when we were discussing the matter with him, 'that one,' pointing to his photograph which we had taken, 'is just the same as me; so is a kangaroo' (his totem). . . . We may, in fact say, that each totemic group is supposed to have a direct control over the numbers of the animal or plant the name of which it bears, and further that, in theory at least, they have the first right to the animal or plant. . . . It will be seen . . . that at the present day the totemic animal or plant, as the case may be, is almost but not quite tabu . . . to the members of the totem. . . . The purpose of the *Intichiuma* ceremony at the present time, so say the natives, is by means of pouring out the blood of kangaroo

men upon the rock, to drive out in all directions the spirits of the kangaroo animals and so increase the number of the animals."⁷

Frazer⁸ accredits to Spencer and Gillen the first demonstration of the totem-sacrament, of which he makes considerable use. "He could not be a Kangaroo man and make kangaroos unless he had in his own body the flesh and blood of a kangaroo; he could not be a Grass-seed man and make grass-seeds unless his corporeal substance were at least in part composed of grass-seeds; and so with the members of the other totem group. Here, it is plain, we have at last the long-sought totem sacrament which Robertson Smith with the intuition of genius divined, and which it has been reserved for Messrs. Spencer and Gillen to discover as an actually existing institution among true totem tribes."

Concerning the taboo on killing or eating the totem, "a certain mysterious connection exists between a family and its *kobong*, so that a member of the family will never kill an animal of the species to which his *kobong* belongs, should he find it asleep, indeed, he always kills it reluctantly, and never without affording it a chance to escape. This arises from the family belief that some one individual of the species is their nearest friend, to kill whom would be a great crime and carefully to be avoided. . . . An old man of one particular totem group, say the kangaroo, will not eat kangaroo at all under ordinary circumstances, but he will make and charm a *churinga* bearing a design characteristic of his group, and will give it to a man of another totem group so as to assist him to catch kangaroos." In the Warramunga tribe, "a man is absolutely forbidden to eat either his own or his father's totem. He may, if, for example, he be a kangaroo man, kill the animal and hand it over to men of the other moiety, and there is no objection to his assisting men who do not belong to his totem group to capture and kill his totem." Mention is made of some men who started out as wild-cat men and changed into plum-tree men and went on eating plums. According to another tradition we have the description of the "wanderings of a hakea-tree woman who set out with a bandicoot woman. The latter painted the hakea woman with down used during a sacred ceremony of the bandicoot totem group, and thereby changed the hakea into a bandicoot woman, who after that went on eating bandicoots." A man of a lizard group in the Arunta tribe, on being questioned, said at first that he was both lizard and grass-seed; on further questioning, that he was really lizard but very nearly grass-seed. The explanation given is as follows: "In the Alcheringa he was a lizard man or man-animal, but some grass-seed men came near to where he was camped and performed sacred ceremonies of their group in the hope of transforming him into a grass-seed man. They were not successful, and he remained a lizard man; but owing to this Alcheringa incident he regards himself and is regarded as very closely associated with the grass-seed people. He does not eat the grass-seed when it is fresh and young."⁹

Brown¹⁰ writes of some tribes of Western Australia that "each of these clans forms a single totemic group, possessing a number of totems. All the totems of the clan are equally the totems of every member of the clan. For each totem belonging to the clan there is within the territory of the clan a cere-

⁷ Spencer and Gillen, *Nat. Tr. Cent. Aust.*, 167, 168, 169, 179, 184, 185, 201, 202, 203, 206; Spencer and Gillen, in *JAI*, XXVIII, 278; "Miscellany," in *JAI*, XXVII, 134.

monial ground or totemic centre for which the name is *talū*. . . . The purpose of the ceremonies is said to be to increase the supply of the animal, plant, or other object with which it is connected." "The totem center determines the totem of the child when first alive in the womb; . . . these centers are definitely localized and do not shift; . . . though sex and class change with each successive reincarnation, the spirit always returns to its proper totem center and . . . thus the totemic identity is never lost."¹¹

Howitt¹² makes something of the sex-totem. One is given to the youth at initiation; again there is a totem which is "the brother of all the men" and one which is "the sister of all the women." "They are not true totems in the sense that these represent sub-divisions of the primary classes; yet they are true totems in so far that they are regarded as being the 'brothers' and 'sisters' of the human beings who bear their names. . . . The sex totems, when first seen, presented a novel but a perplexing problem, because they merely divide the tribe into two moieties, one including all the males and the other all the females. The true character of the sex totem is shown by the Wotjobaluk expression, 'The life of a bat is the life of a man,' meaning that to injure a bat is to injure some man, while to kill one is to cause some man to die. The same saying applies to the Owlet-nightjar with respect to women. A man who was lax as to his totem was not thought well of, and was never allowed to take any important part in the ceremonies." In one of the tribes, a man "would not harm his totem if he could avoid it, but at a pinch he would eat it in default of other food. In order to injure another person he would, however, kill that person's totem. To dream about his own totem means that some one has done something to it for the purpose of harming the sleeper or one of his totemites. But if he dreams it again, it means himself, and if he thereupon falls ill, he will certainly see the wraith of the person who is trying to 'catch' him."

Parker¹³ found that "our blacks may and do eat their hereditary totems, if so desirous, with no ill effects to themselves, either real or imaginary"; but while he may eat of his family-totem, inherited from his mother, he must never eat of his own individual, familiar totem. None of the same totem as the dead person may dig his grave. "Every individual, as soon as he or she arrives at the necessary age, is forbidden to eat—not necessarily to kill—certain animals, each paedo-matronymic group having its own particular group of things that are 'tabooed.' Notwithstanding very careful search, I can find no plants, trees, shrubs, or grasses, as prohibited. Upon this point these aboriginals appear to be extremely particular, and should one of them wilfully partake of that which is 'tabooed,' he is firmly convinced that sickness, probably of a fatal character, will overtake him, and that certainly it would never satisfy his hunger. Should such a delinquent be caught red-handed by his fellow-men, he would in all probability be put to death."¹⁴ Gason¹⁵ finds that the sons follow their fathers' totems and the daughters those of their mothers. Fathers at a funeral do not eat of their offspring, but female relatives must, in order to have the dead in their liver, the seat of feeling. Mathews¹⁶ says that when the Central Australian woman first feels premonitions of maternity she reports a dream—that she has heard infants laughing in the leaves of a tree. When the child is born, it is given the totem of those who haunt that place, not the totem of either parent. The relation of the person and his *churinga* may

be brought out in clearer detail by the following: "When one of these 'dream-time' ancestors died, he was turned into a spirit-child, and as such dwells near one of the camping grounds, always carrying in his hand one of the *churinyas*. Conception is believed to take place by the entry of one of these spirit-children into the mother, the spirit-child dropping his *churinya* on the ground at the time. On the birth of the child the place is searched for the lost *churinya*, and by the kindly offices of one of the old men the search is usually successful. If it be not, a wooden one is made of hard-wood. . . . The stone *churinyas* are the more ancient form, and do not appear to be made at the present day. This then fixes the totem for the individual, and explains why in the Arunta tribe the child is not of the same totem as one of the parents, as is the case in some of the neighboring tribes of Central Australia."¹⁷

Von Leonhardi,¹⁸ upon evidence furnished by certain correspondents in Australia, imparts the following. Certain ancestral spirits that live in subterranean caves may come out in the evening and station themselves by a rock or tree. If a woman goes by, such a spirit may be seen by her suddenly to disappear, and this is attended by symptoms of pain which convince her that he has entered her body. So too if a woman experiences the first indications of pregnancy just after she has seen a kangaroo, which has run away and suddenly disappeared, she will later bear a kangaroo-child. Further, if she experiences pregnancy after eating copiously of a certain fruit, the child will receive the plant in question as a totem. "Every individual stands in relation to two totems; to the one he belongs by birth or, more correctly, by conception . . . ; the other totem belongs to him, or is bound to him—has community . . . with him. . . . In consequence of the view that a human germ of the most diverse totems can enter any woman whatever, there can be no heritable totems. The child may belong to another totem . . . than the father or mother. . . . Of course, generally . . . a germ from the totem of the husband enters any particular woman, so that the totem of the father and the children is the same."

America. "From one end of America to the other the native was reported to have eaten all living creatures—man not excepted—barring the fact, however, that one dare not eat the flesh of the animal selected as his guardian or which was the totem of his clan, lest its shade should resent the action. In certain sections, however, one was allowed to consume even his totem animal, provided certain prayers and invocations were addressed to the shades of the dead animal, to which explanation was made of the necessity under which the individual labored through hunger."¹⁹ One of the native American doctrines is "that persons and organizations of persons are one and all under the protecting and fostering tutelage of some imaginary being or spirit. These tutelary or patron beings may be grouped, by the mode and the motive of their acquirement and their functions, into two fairly well defined groups or classes: (1) those which protect individuals only, and (2) those which protect organizations of persons. . . . The exact method of acquiring the clan or gentile group patrons or tutelaries is still an unsolved problem." It would seem, then, that we have, in the American type of totemism something different from the Australian. Morgan²⁰ evidently regards the animal-designations, of which he cites a number, as merely distinctive class- and group-marks. "In the Ojibwa

¹⁷ Anon., in JAI, XXVII, 133.

¹⁸ In *Globus*, XCI, 288.

¹⁹ McGuire, in AA, III, 263.

²⁰ *Anc. Soc.*, 165.

dialect the word *totem*, quite as often pronounced *dodaim*, signifies the symbol or device of a gens; thus the figure of a wolf was the totem of the Wolf gens. From this Mr. Schoolcraft used the words 'totemic system' to express the gentile organization, which would be perfectly acceptable were it not that we have both in the Latin and the Greek a terminology for every quality and character of the system which is already historical."

How the young Indian, having attained through fasting and torture to the state of trance, out of his visions derives some object which amounts to a tutelary spirit, has been alluded to elsewhere.²¹ The object was generally an animal. The totems of the kinship groups, which traced descent through the father and practised exogamy, were the special manifestations of the supernatural which had appeared to the founders of the clans in their ancient visions, and which their descendants held sacred under the taboo. The religious societies laid hold of this situation, for they are a grouping together of men who have had similar visions. Under the totem the members of the gentes or tribe learned the duties of kindred and to maintain the unity of the tribe. The gentile totem gave no immediate hold upon the supernatural, as did the individual totem in the case of its possessor.²²

Morgan²³ lists the gentes (clans) of many tribes, but one example will serve for all. The Seneca Iroquois gentes were those of the Wolf, Bear, Turtle, Beaver, Deer, Snipe, Heron, and Hawk; others of the Confederacy recognized alternatives, such as the Eel for the Heron, or recognized the Great Turtle and the Little Turtle.

But if the Indian type of theory and practice does thus differ from the Australian, there are many points common to the two. Among the Iowas no member of any clan can eat the flesh of the eponymic animal.²⁴ "The first fast is the first important event in an Ojibwa's life. For this he leaves his home and goes to a secluded spot in the forest, where he fasts for an indefinite time; when reduced by lack of food he enters a hysterical or ecstatic state, in which he may have visions and hallucinations. The spirits he most desires to see in this condition are those of mammals and birds, though any object, animate or inanimate, is a good omen. The object which first appears is adopted as the guardian spirit, and is never mentioned by the entranced without first making a sacrifice. A small effigy of this *manido* is made, or its outline drawn, which is carried suspended by a string around his neck, or, if he be a *Midé* [member of a medicine-society], he carries it in his 'medicine bag'. . . . Until recently it was the custom for each Indian youth to pass through a certain process of 'fasting and dreaming,' whereby he might receive a manifestation from the Great Unknown as to what particular animate form he might adopt as his tutelary daimon, or guardian mystery. . . . Among some of the Algonquin tribes the animal or bird forms thus adopted by an Indian are sometimes the same as the totem of which he is a member. Under such circumstances the animal representing the totem, and the 'familiar' or *manido*, is seldom hunted or shot; but if he should be allowed to hunt such an animal, the hunter first addresses the animal and asks forgiveness for killing him, telling him that certain portions, which are tabu, shall be set up in the place of honor. . . . For instance, if an Indian of the Bear totem, or one whose adopted guardian is represented by the bear, desires to hunt and meets that animal, he would

²¹ §§163, 244, of the text.

²² Fletcher, in JAI, XXVII, 438; Fletcher, report in PSM, LII, 284.

²³ *Anc. Soc.*, 70; also ch. VI.

²⁴ Dorsey, in BAE, XI, 426.

apologize to the bear before killing it. The carcass would be dressed and served, but no member of the Bear totem could eat the meat, though members of all other totems could do so freely. The hunter could, however, eat of the paws and head, the bones of the latter being subsequently placed upon a shelf, probably over the door, or in some other conspicuous place. Due reverence is paid such a relic of the totem, and the custom is so strictly observed that no greater insult could be offered to the host than for anyone to take down such bones and cast them carelessly aside.²⁵ A portrait of a warrior, say Buffalo Bull, shows his medicine or totem, in this case the head of a bull-buffalo, painted on his face and breast.²⁶

Among the Northeastern Algonquins the hunter is visited by a guardian-spirit in the shape of a beaver who instructs him where and under what conditions he will find game. Since this animal forms so important an element in the diet of the tribes of this region, the natives believe that the beaver-spirit in dreams directs them generally to where beaver may be found. The game so obtained must be cooked and eaten in a prescribed way. "Observing in this region the attitude toward the totem where relationship is maintained by killing the totemic animal and eating it, and by using its fur, the association with the creature is not so unlike the more common practice of reverence for the totem by not killing, eating or using it as may seem. In the whole northern region the various animals are treated with respect by their slayers who prepare the bones and other remains of the game and dispose of them in a manner thought to be satisfactory to the animals' souls, so to speak. Thus in the religious thought of the north a hunter is satisfying an animal's spirit about as much when he kills the animal and disposes properly of its remains as when he refuses to molest it at all. While the above procedure is quite contrary in practice to the procedure of African, Australian, and a number of American totemites, it is not so contradictory in principle, its objective in reality being the maintenance of the game."²⁷

It is noteworthy and significant that two races so widely separated and so dissimilar as the natives of Australia and those of North America should have so many points in common in their system of naming. Both have hereditary "secret" or "mystery" names, which always refer to some event in the lives of the ancestors of the groups or families, or to the supposed origin of the founders of these. These family or hereditary names among all the tribes, but especially among the Delta and Coastal divisions, were regarded as among the most sacred possession of the kin-group and were most jealously guarded. It is the opinion of Hill-Tout,²⁸ who has made a special study of the Indians of British Columbia, that among the Salish, at least, the personal name and totem gave rise to the group- or kin-name and totem. According to the belief of these natives the *snam* or personal totem may be transmitted to another; this is usually accomplished by uttering some mystic words and by blowing or breathing upon the symbol of the *snam*. "A brother does not call his brother or his sister by a *snam* or hereditary or even by a *staz* [nick] name, but always by a term expressive of their relative ages; and when speaking of them to others he uses terms with similar meanings. A man's 'proper' names seem only to have been used among the Salish on ceremonial occasions, or when one

²⁷ Speck, in AA, XIX, 10, note (quoted), 16-17.

²⁸ In JAI, XXXV, 146-147, 148-149, 151, 152, 153, 154-155.

wished specially to gratify or honour a person. . . . On occasions of public ceremony, such as the potlatch or other feasts, or at the winter dancing, men were always formally addressed by their hereditary, mystery or *snam* names." Further evidence that the kin-name was originally the personal mystery-name or *snam* name of one of the ancestors of the kin may be found in the study of the crests. "Every individual had a *snam* mark or picture, in other words a personal 'crest,' the symbol of his *nagual*. This he customarily placed upon his personal belongings to mark or distinguish them from those of his fellows. But when we descend the river and meet the Delta and Coastal tribes, we find the personal 'crest,' like the personal totem, giving place to the kin-group 'crest,' which among these tribes is possessed by every family of standing, and is its peculiar distinguishing visual mark." Among the Salish a *súlia* or personal totem, whose material form was that of an edible object, enabled the owner of it to be eminently successful in his quest for that object. "It seems to suggest that the life of the owner of such a *súlia* was bound up, or intimately connected, with the well-being or existence of those objects under which his *súlia* manifested itself. . . . Not everybody acquired a *súlia*; only those who excelled in their special lines, such as great hunters, fishers, warriors, runners and the like"; women as a rule never acquired *súlia* unless they were witches. All the animals in the old time were not just common animals and nothing else; they were people as well, and could take the human or the animal form at will by putting on or taking off the skin of the animal. "This shape-shifting or transformation was invariably effected in this region by donning or casting off the skin of the animal whose character is assumed. . . . Shamans only inherited their *súlia* from their fathers; other men had ordinarily to acquire their own. But this applied only to the dream or vision totem or protective 'spirit.' In the case of the acquisition of a totem or protective 'spirit' by other means . . . a man could and did transmit the protective influence he had acquired." However we may view the "dream" *súlia*, there can be no doubt that "tutelary spirits" were transmitted and handed down from one generation to another; by which it becomes clear that "group"-totemism existed among the Salish. "We have, therefore, in this country," Hill-Tout²⁹ concludes, "three different kinds of 'group' totemism (not counting those of secret societies, or brotherhoods), viz., that under matriarchal institutions, which American students, following Powell, now generally denominate 'clan totemism'; that under patriarchal rule distinguished from the former by the term 'gentile totemism'; and that which we find in social groups like the Salish, where a union of the two earlier states has taken place, and where the social unit is the 'family,' which comprises the relatives on both sides of the house, which I may denominate 'kin totemism' for lack of a better term. In all these groups there is the same transmission of the *common* 'protecting genius,' from one generation to another. Under matriarchy, this is effected by the 'conventional fathers' of the group on the female side of the house, that is, by the maternal uncles. Under patriarchy by the 'ostensible or real fathers' of the group on the male side; and under that social structure which results from a combination of the other two, like that among the Salish, by the 'fathers' on both sides of the house."

Boas³⁰ says that the Tlinkit, Haida, and other Indians of the northwest coast "have animal totems. . . . The clans of the northern tribes bear the names

of their respective totems and are exogamous. It must be clearly understood, however, that the natives do not consider themselves descendants of the totem. All my endeavors to obtain information regarding the supposed origin of the relation between man and animal have invariably led to the telling of a myth, in which it is stated how a certain ancestor of the clan in question obtained his totem. . . . It is evident that legends of this character correspond almost exactly to the tales of the acquisition of manitows among the Eastern Indians, and they are evidence that the totem of this group of tribes is, in the main, the hereditary manitou of a family. This analogy becomes still clearer when we consider that each man among these tribes acquires a guardian spirit, but that he can acquire only such as belong to his clan. Thus, a person may have the general crest of his clan and, besides, use as his personal crest such guardian spirits as he has acquired. This accounts partly for the great multiplicity of combinations of crests which we observe on the carvings of these people. . . . There exists, however, another class of traditions, according to which the crests or emblems of the clan are not acquired in this manner, but brought down by the ancestor of the clan from heaven or from the underworld or out of the ocean, wherever he may have derived his origin." Then there is a variant connected with membership in the secret societies. "Many ancestors, when obtaining their manitous, were given the right to perform certain dances, or they were given secret songs, or the power to eat human flesh. These rights have also become hereditary, but they differ from the crest in so far as the character of the initiating spirit (the manitou) has been more clearly preserved. Each individual, who by descent or marriage is entitled to membership in one of the secret societies, must nevertheless, be initiated by its presiding spirit before joining the society." There is still "another class of legends which relate entirely to spirits that are still in constant contact with the Indians, whom they endow with supernatural powers. In order to gain their help, the youth must prepare himself by fasting and washing, because only the pure find favor with them, while they kill the impure. Every young man endeavors to find a protector of this kind. It is clear that this idea corresponds exactly to the manitou of the Algonquin Indians, and that we have to deal here with the elementary idea of the acquisition of a guardian spirit, which has attained its strongest development in America. Its specific character on the North Pacific Coast lies in the fact that the guardian spirit has become hereditary. This is the case among the northern tribes of British Columbia. It is also the case among the Kwakiutl and among the Chinook. When the youth prepares to meet a guardian spirit, he does not expect to find any but those of his clan. This is probably the reason for the relatively small number of such spirits—for among the Indians of the plains, among whom each man has his individual spirit, their number is unlimited—and it has also given occasion for the development of a more elaborate mythology relating to these spirits." The tribes of the northwest coast all claim to be autochthonous; the ancestor of each clan descended from heaven, in most cases in the shape of a bird, and the crest he adopted hints at his exploits. Tylor³¹ thinks this set of beliefs to be "a special modification of the totem theory, made to fit with the belief in family descent by means of transmigration of ancestral souls."

The development of the totem-ceremonials and especially of the totem-pole is popularly connected with the northwest coast. "The Tlingit of southeastern

Alaska, living under most favorable conditions of climate and food supply, with abundant leisure to cultivate an innate sense of art, evolved in time a rich ceremonial that had for its purpose the glorification of the family in the display of the totem, or the practice of shamanistic rites which constituted his nearest approach to any form of religion or worship."³² The totem-poles of the natives of Alaska, while bearing images of creatures, were never erected to represent any imaginary deity or god. "Nor were they ever worshipped. They are highly revered because they carry the tribal emblem. What the coat-of-arms, or crest, is to families of the English aristocracy, so are totemic marks to native families. The Englishman reveres the family crest, but does not worship it; so does the native with his totemic emblem." Their names refer to this crest or totem, and as soon as one hears the name of another he knows exactly where to place him.³³ The Columbian tribes have a *tamanuus*, or medicine, which they reverence as their protecting spirit. Early in life each man chooses such a *tamanuus*, and it is usually an animal.³⁴

Kroeber³⁵ says that the California tribes, so far as known, all lack any gentile or totemic system, while among the tribes of the southwest totemism is a marked feature of the social organization. But Merriam³⁶ finds that the ethnologists have overlooked the evidence. "This may be due to the less conspicuous part it plays in the lives of the people compared with its high development in some other regions, notably Alaska and British Columbia. Nevertheless totemism not only exists in California, but is rather widely prevalent; it is present in many tribes—tribes distributed among widely different stocks; and, when one comes to understand something of the inner life of the people, it is found to be as deeply rooted, and in some cases as important, as in other regions. . . . In California the totem is always an object in nature—usually an animal, but sometimes a tree or a rock. . . . Certain animals are never totems. Conspicuous among these are the Coyote and Fox. The only tree totem is the Black Oak. . . . In the Middle and Southern Mewuk the totem is hereditary and passes from father to child; the mother's totem is not carried down. If the father is a Deer, all the children—boys and girls alike—are Deer. In the Northern Mewuk on the other hand the totem is individual, not hereditary. The father may be a Bear, the son a Gray Tree-squirrel, the grandson a Lizard, the aunt a Yellowjacket Wasp."

"The psychic element of religion in the Snake dance is totemic ancestor worship which is fundamental in the whole Hopi ritual. The reptile is a society totem, the lineal survivor of a clan totem, and the totem ancestor, called the Snake maid, is, generally, like totemic ideas, an anthropo-zoö-morphic conception. Members of the society claim immunity from the bite of the snake because it is their totem, and the idea of possession of the shade or 'breath-body' of the dead by the snake totem is in accord with universal totemic conceptions. The Snake dance is simply a form of clan totemism having special modifications, due to environment, to fit the needs of the Hopi. It is a highly modified form of ancestor worship in which the Sun and the Earth, as parents of all, are worshipped, but in which the cultus hero and the ancestors of the clan are the special divinized personages represented in secret rites."³⁷

The *zemi* of Porto Rico primarily "corresponds with the totem of the North American, and *zemism* is practically another name for totemism, a form of

ancestor worship.”³⁸ It is stated that some of the natives of South America are totemists,³⁹ but the evidence is very scanty. We learn that the young Paraguan Indian, leaving his own family to go to his wife, takes along his family-crest or totem with great ceremony and plants it before the bed. This is vague; the author⁴⁰ cites similarly inconclusive evidence from Im Thurn and Ehrenreich. The Araucanians believe they originally descended from the animals whose names they bear, but have no clear idea as to whether this descent was on the mother’s or on the father’s side, although most of them incline to the former. “The corporeal forms which they assign to their divinities also indicate that there has been formerly an animal worship, which was possibly only a transition from totemism, and may have originated in some form of ancestor worship. . . . No prohibition attaches to the killing or eating of special animals, although there are a few such superstitions among the elders.”⁴¹

Other Parts of the World. The Tasmanians showed no traces of the totemism that was so widespread in the neighboring continent.⁴² In New Guinea, in the assembly-houses, the cross-beams are carved with lizards, turtles, fish, and birds, “without doubt in honor of ancestors that have gone over to such forms or have descended from these beasts . . . and so too is totemism current among them, that is, the idea of once having had an animal in the kin-group and of honoring it for this reason. Many an one derives his origin from a pig and therefore refrains from eating pork; by others again the crocodile is spared because their tribal mother gave life, along with their ancestors and at the same time, to a crocodile. Whoever has such ties through his mother is, according to the notion of several tribes, turned into the related animal after death. It is noteworthy that, in case others kill such an animal, to which one thinks himself kin, he has to undertake a fight, though only a counterfeit one, with them, and must give a mourning feast in honor of the deceased related crocodile, kangaroo, or whatever it was.” Then too the form which the ancestor had is incised upon amulets and even branded on the forehead, breast, and arms in the form of the proper animal; “they consecrate themselves to the spirit of their ancestors by portraying the original bodies of their ancestors upon their bodies.”⁴³ No man may carry or eat any kangaroo that he has killed. He generally exchanges it with another man similarly situated.⁴⁴

In one of the tribes of the Papuan Gulf, a native’s explanation why a certain mammal, bird, or fish is regarded by him as his particular *ualare* is that it was held to be sacred by his original ancestor. “For the present we have to be content with the statement that a certain animal was regarded as sacred by the original ancestor; he never injured or killed it, never ate it as food when killed by anyone else, and because it was held sacred by him, his posterity for all time must also regard it as sacred. If a man accidentally kills a member of the family of his *ualare*, he sets aside a period for mourning, during which period he fasts from the principal kind of food, eating only enough to keep himself from absolute starvation; he also observes many of the customs of mourning as if he had lost a relative. If on the other hand he kills a member of his *ualare* family in a fit of anger or for any other reason that is not justifiable, as soon as he recognizes what he has done he gives himself over to
